METHODS OF APPLICATION.—Rows are made with a drag marker about the middle of April so the fertilizer can be distributed and have at least one rain on it before ridging. This washes out the injurious salts that would otherwise burn the plants. Because of burning it is very important to have fertilizers in early, especially on light soils. The fertilizer is distributed with a drill having a tooth behind to mix it in the soil. From 200 to 400 pounds of sulphate or muriate of potash is often used to supplement that supplied in the ready-mixed goods. This is applied broadcast over the ground and harrowed in before marking. Sulphate has the preference over muriate. Ridges or hills are made toward the last of April with a sweet potato ridger. A rain before setting time settles the soil in the ridges and makes ideal conditions for planting.

PLANTING.—Plants or slips are grown from potatoes imbedded in a hotbed. Small potatoes from one to 1½ inches in diameter are used for this purpose. Near Swedesboro sweets are bedded between March 20 and April 1, and they are usually in the field by May 15. Some growers put them out in April. Those who did so this year are far ahead of their neighbors who got them out later right in the midst of a drought that lasted until after June 15. Those who put their plants in the field before May 5, this year, were, many of them, able to get their crop off before September 1, and secured very high prices. Plants put out about June 1 are just beginning to reach marketable size. Near Vineland sweets are bedded much later than at Swedesboro. I visited one grower who did not bed his potatoes until May 10. He grew a crop of early peas, then put out sweet potato plants about July 1. They grew right off and will mature before frost. Few growers in that section try to get ther plants out before May 15, and quite a number of them follow the practice of setting plants after peas. One year with another it works out quite well, but, of course, they do not get off any potatoes for the early market. Most of their crop is stored. Puddling the roots of plants before setting is an advantage. If soil is dry, plants must be watered. This year some of our own potatoes were watered three times, and then barely pulled through.

CULTIVATION AND HARVESTING should begin when plants are thoroughly rooted and continue once a week until vines cover the ground. Potatoes set in warm sandy soil and pushed for earliness can often be dug in August. Such a crop always pays, and has some advantages over a crop dug later. The bulk of the crop, however, is usually dug between September 15 and October 20. When digging, it is best to cut vines first with one of the better makes of vine-cutters now on the market, and then run under the potatoes with a regular sweet potato digger. The diggers are similar to a plow, only they have an iron strap or else several fingers attached to a short mold-board. Potatoes are allowed to dry off before being put into baskets and should not be dug when the soil is very wet. When intended for storage the plants or hills should be lifted carefully and laid in piles, after which the potatoes can be picked off by hand. When shaken off in heaps there is much bruising and skinning, which favors rot in storage. Ordinary ⅝-bushel baskets are generally used for marketing sweets in home markets. When shipped to distant markets they are sold in double-head barrels or bushel hampers. Sweets for storage should be dug before the ground freezes, handled carefully and placed in storehouses where plenty of ventilation can be given. When first stored a temperature of 80 to 90 degrees Fahrenheit should be maintained, and all possible ventilation given until potatoes have passed through the sweating stage, after which the temperature can be reduced and held at 45 to 55 degrees Fahrenheit.

TRUCKER, JR.

FITTING THE FALL-PLOWED GROUND.

ANY land that is in the proper condition for plowing will always be in the best condition for working down in a few hours after being turned over. This practice is an economy in every instance, whether the soil be of light texture or of the clay loam order. This Fall I have seen many fields even on farms where progressive agricultural methods are supposed to be practiced, where the whole field has been plowed over before any attempt has been made to pulverize the surface. The result of such treatment is that the expense of preparing a seed bed has been doubled, while the work is done by a grinding, crushing process. That injures the soil texture, and moisture has been allowed to escape that can never be replaced in the same condition as when the soil was first turned over, even if showers should occur. Such treatment of the soil is an insult to generous nature. All this results from the short-sighted idea that the important thing is to get the field plowed over, and that the fitting down can be done at any time. If the fresh turned furrows were worked down with a plank drag, or log clod-crusher, the surface would be leveled, all the holes made in the soft earth by the horses' feet would be filled, as well as the strip between the furrow slices, and the surface would be left with a rough print, the best possible condition for moisture retention. A roller does not fill up the holes, does not break the clods any better, and leaves too smooth a surface. It does not level the ground.

If this work be done toward evening, after each day's plowing, the seed bed will be in better condition at a greatly reduced expense. I have just returned from an afternoon ride through a good farming section where spring-tooth harrows were being hauled over the dry and crusted furrows, in the attempt to fit the fields for wheat. Once over at the right time with the right implement would have accomplished more than three times over in the present condition. After the furrows have been run over with the drag or clod crusher, and perhaps a shower has occurred, then the spring-tooth harrow is a most effective implement to mellow the soil. When we do not have time to prepare the seed bed properly either there is a lack of efficient farm management, or the job on hand is too big for us, and less acres might be a better proposition.

HENRY E. COX.

VALUE OF VETCH AND RYE.

Plowing Under Stubble in Michigan.

AS to vetch and rye—on June 29 I plowed an acre of vetch and rye stubble and planted half of it in corn and half in potatoes, as an experiment. I expected to get fodder and nubbins from the corn and a small yield of potatoes. We had a good season for sandy soil, and the frost has considerately held off; the result is corn from eight to 12 feet high and ears from 10 to 12 inches long of fine corn. A neighbor who has farmed in Illinois, said: "That looks like Illinois corn." In one hill there are seven stalks with an ear on each one. We haven't dug the potatoes yet, but from the looks of the vines they will pay for the planting. We used no fertilizer, and that field has had nothing but rye and vetch grown on it for three years, but never a crop turned under. The vetch seed that shattered out at harvest last year, has come up between the potatoes and corn rows, so we will not have to re-seed that portion of the field. The corn planted was yellow dent.

I notice you advise against putting in rye and vetch in Pennsylvania and New York after the last of August. We have sowed it as late as October 1 in this latitude, and had it do well. The vetch grows enough in October and November not to Winter-kill even when the snowfall is light in December and January. Of course, our sandy soil is warm. Just keep on hammering rye and vetch as cover crops, and the doubting Thomases will yet bless you. Of course, it would be best to plow it under, but just growing vetch on soil improves it even if the crop is cut for hay or seed—for it adds nitrogen to the soil. Our horses prefer vetch hay to Timothy, and it is better feed and makes better manure. No more clover or Alfalfa for—

F. B.

Ottawa Co., Mich.

R. N.-Y.—No doubt there are soils or favored localities where vetch may be seeded late, but, as general advice, we would not sow it after September 1 in this locality. We shall be glad to have further experience. As for receiving a blessing from the doubting Thomases—it would, of course, be agreeable, and sound evidence such as "F. B." gives us helps to produce it.

FACTS ABOUT HANDLING TIMBER.

PERSONAL EXPERIENCE.—The article, "Marketing The Timber Crop," by Chester L. Mills, on page 1121, comes closer to facts in disposing of timber than any I have seen in any other farm periodical or department bulletin. A few further facts may help those interested in solving this troublesome problem. I have been up against this proposition for three years, and have contracts to run for three years more, and the terms and conditions may enlighten some who are contemplating selling.

WHITE PINE.—Our White pine was sold "on the stump," "Scribner Rule to govern," at $12 per thousand log feet. The buyer and my man kept tally and compared notes. My mistake was in not demanding "saw measure" or board measure, "sawyer's tally" to govern settlement. This would have given me about one-third more feet. The buyer had three years to "cut and clear"—"right of ingress and egress," and two mill stations and necessary piling station; 50 per cent was paid at signing of contract, and 40 per cent. a year from that date. When final settlement was made buyer was to pay seller, if timber overran estimate, and if it underran, seller was to make good difference. As the timber market "went bad" last year, buyer's time was doubled, to help out.

HARDWOOD.—Our hardwood was cut, skidded and hauled to local mill yard, 2½ miles away, by our own timber crew. This cost us $5 per thousand feet from stump to mill as follows: For cutting, $1 per 1,000 feet; for skidding, $1; for hauling, $3. We had to deliver 50,000 feet to mill before any settlement was made, and subsequent settlements were made on each 50,000 feet delivered to mill. Here it was inspected and graded, paid for as follows:

Hemlock at $12 per M, log measure—Scribner Rule.
No. 1 Birch at $12 per M, log measure—Scribner Rule.
No. 2 Birch at $8 per M, log measure—Scribner Rule.
Hard Maple No. 1, $12 per M, log measure—Scribner Rule.
Hard Maple No. 2, $8 per M, log measure—Scribner Rule.
Soft Maple No. 1, $10 per M, log measure—Scribner Rule.
Soft Maple No. 2, $8 per M, log measure—Scribner Rule.
Beech at $8 per M, log measure—Scribner Rule.

Hemlock to be cut in 16 ft., 18 ft., 20 ft., 22 ft., 24 ft. lengths.

Birch to be cut in 12 ft., 14 ft., 16 ft. lengths.

Beech to be cut in 16 ft., 18 ft., 20 ft. lengths.

Hard maple to be cut in 10 ft. 6 in. and 14 ft. 6 in. lengths and be measured as 10 ft. and 14 ft. lengths.

Soft maple to be cut in 12 ft., 16 ft. and 18 ft. lengths.

Cutting in both contracts began in September; awaiting the first snow, piled on skidways. Nothing was cut under 12 inches in diameter.

A FEW SUGGESTIONS.—Always sell to a local man and cut out transportation, and in making contracts you are governed by the "custom of the country." Lumbering is fascinating and sometimes profitable. Always have your own tools—cant hooks, planes, etc. When timber has reached its full growth it should be cropped, as grain is, and sold. This makes room for young, growing timber, and saves losses from wind, flood and lightning. As a rule, beauty spots don't pay. I have 450 Sugar pine and Western Yellow pine seedlings, which I secured from my friend the State Superintendent of Forests, Clifford Pettis. They attain a height of 250 feet, but I never expect to live long enough to sell them. I hope our readers will give Mr. Pettis their full support in his efforts to develop a strong forestry organization in New York State.

New York. HENRY C. COUSE.

A FAMILY GROUP. TOPPING ONIONS IN SOUTH JERSEY. FIG. 523.

MAKING A SOIL FOR GRASS SEEDING.

I WISH to get a good substantial sod on an embankment which has a slope of two horizontal to one vertical. The loam in this vicinity is very shallow and stony, and, therefore, expensive to excavate and place. Some of this work has been completed and a satisfactory sod secured, but I desire to cheapen the process, if possible, in the following manner: Of the 25,000 cubic yards remaining to be placed one foot deep on the slopes, I would like to substitute for the soil a mixture of swamp muck and clay. There is a conveniently located swamp containing black muck, which was covered with a small growth, but which now has been cleared and burned. This muck, averaging four to six feet deep, could probably be loaded by steam shovel, as would the clay from a nearby pit, and all hauled to the top of the embankment in dump cars, and cast down the slopes by hand, whereby the clay and muck would become mixed. Would you consider this a practical scheme, remembering the object is not a big crop of hay, but a good protective sod? What proportion of muck and clay would you advise? Have the ashes on top of the muck had a tendency to sweeten or benefit it? Would the sod or grass so produced have a tendency to soon run out or would it be as permanent as though the poor quality of rocky soil were used? Would you advise a fertilizer being used to give the seed a start, and if so, how much? In the work we have completed we have sown seed of the following proportion, at the rate of 60 pounds per acre, and used 500 pounds per acre of seeding-down fertilizer or its equivalent: Red-top, 25 pounds; Rhode Island Bent, 25 pounds; Timothy, 17 pounds; Kentucky Blue grass, five pounds; White clover, one pound; Red clover, one pound; oats, three pounds. I made two mixtures of the above-mentioned muck and clay, one equal parts, the other one-fourth muck to three-fourths clay, and planted the grass seed without fertilizer on each plot about 18 inches square. After one week of showery weather the grass has a good start, and I cannot see any difference in the two.

New York. F. H. T.

It is quite probable that you will have better results using the clay and muck than the soil you mention; possibly not better results, but as good, provided the work is done properly. Several landscape gardeners here have used the mixture on terraces, using three-fourths clay and one-fourth muck, *but it must be mixed thoroughly.* It is also advised mixing a small proportion of either pulverized sheep or other fine manure, and a fair coat of lime would also be beneficial.

The experience of these men has been that this material should be thoroughly mixed and placed in the Fall, and made as firm as possible, then the seed sown *very early* in Spring, after all small gullies that wash out during Winter are filled. After sowing seed make as firm as it is possible to do it. The sod should be permanent if fertilized occasionally when appearances would indicate the necessity of it.

I have had no experience in mixing seed, as seed used has been a mixture sold by seedsmen for special work, and feel sure that any good reliable seedsman will be able to make a terrace mixture that will be more satisfactory and lasting, than one not having their experience in this matter. E. J. W.

THE SENSE IN "OLD SAYINGS."

AS to the moon, the divining rod and others of their ilk, I don't believe it is going to rain to-morrow just because the tin peddler passed to-day. Don't laugh. I had a man working for me once who did believe just that, and insisted that he had never seen it fail. He was the same man who refused to take the shoes off a dead horse because to do so would surely cause the death of another horse. Nonsense, you say! Of course it is nonsense, and there are thousands of other old sayings just like these two which are evidently ridiculous. On the other hand, it is only a few years, as time goes, since we laughed at the man who said "Lime enriches the father but impoverishes the son." How could the inanimate lime distinguish between the two generations? We have lived to learn what this means, and to learn that it is very true. It has been scientifically explained.

As we were working in a meadow together one of my men said: "I see five-finger is coming into this lot, and if it does the grass will go out. Timothy don't like five-finger." Just another of the old sayings. Let us see. Curiously enough it was only a few days later that one of my professional friends dropped in, and walking across the same meadow casually remarked: "I observe that cinquefoil is encroaching here. That indicates acidity, and you cannot expect a good stand of Timothy in an acid soil." Ah, ha! I see! Then it was not a social antipathy of the aristocratic Timothy for the plebeian five-finger, but was indeed a fact, crudely expressed because coming down through hundreds, perhaps, of generations, but none the less true.

I hold no brief for the moon. I am not in the least "looney." I do not believe that it makes a particle of difference to a piece of potato whether it is planted in the dark or the full of the moon. But I do not laugh at the man who does believe it, because "He laughs best who laughs last," and it is quite possible that some clever professor of the future may find that it is true, and why it is true. We all know that the "line" is only imaginary, and the sun does not get a jolt in crossing. The fact remains that I was married during an equinoctial storm 22 years ago, and it has rained on every anniversary. If this happened just to spoil my celebrations how do you account for the hundreds of times it happened before I was married? Is not it more reasonable to think that the position of the sun has something to do with it? I know absolutely that the tin peddler can-

(*Continued on next page*)

THE SENSE IN "OLD SAYINGS."

(*Continued from pagt 1203.*)

not control the weather. I think Prof. Marvin is right in concluding that the moon has little or no effect upon it. Neither he nor I nor anyone else can prove, however, that the moon does not affect the weather, and what we can't prove we are wise not to assert.

When I first came out of the city I undertook to give some bystanders a chance to laugh at a "water witch." Alas for me, he handed me the twig and said: "Try it yourself." I could not refuse, so I took it, determined that it should not turn down in my hands. I would have given a brand new city hat I was wearing to keep my determination, but the twig began to twist, and the harder I gripped the more it turned. I set my teeth and clenched my fists, but the twig turned down and the crowd had their laugh, but not at the "water witch." It was a good lesson for me, and any success I have since had in the country has come from realizing my own ignorance and being willing to listen to my farmer friends. I don't bother to plant buckwheat in the sign of the twins, but I don't laugh at the successful buckwheat grower who does. If some day some of these things are explained I won't have to apologize for having laughed.

CITY IGNORAMUS.

A Crop of Onions.

CAN you tell me how to cure onions grown from seed? When should they be left in the ground, until all the tops are dead? How low a temperature will they stand? Can they be properly cured in the field? I have no drying shed but spread them on attic floor after topping. They seem to grow very well here and there is a good market for them at fair price. I shall have 50 bushels on less than one-eighth acre and not more than a bushel of small ones.

New Hampshire. A. S. A.

Most growers prefer to have their onions fully ripe before harvesting. When fully ripe the tops are entirely dead and the outer skin of the bulbs dry. While this is very desirable still there are other things to be considered. In the late Fall there are often heavy rains that cause losses or else seriously interfere with the best work in curing. A second growth may start. In view of these things growers are often justified in pulling and topping when the tops are just beginning to turn yellow. Where onions of the foreign type are grown in Southern States it is especially desirable to harvest them early. To hasten maturity growers often run a roller over the field to mash down the tops. This, however, is not equal to natural ripening. August and September are the months when the bulk of the onion crop is harvested in the North.

A mature onion cannot stand alternate freezing and thawing, but a well cured onion frozen solid and kept in the condition will come out all right in the Spring. If weather conditions permit it is best to cure onions as much as possible in the field. To do this onions are pulled and laid in rows where they remain at least two or three days. They are then topped and stored in an open shed or room where plenty of ventilation can be given. This finishes the curing. Slatted crates are convenient receptacles for storing onions and admit of air. White onions are quickly injured by exposure to sun and air and must be handled more carefully than yellow onions. If your attic has windows so the air can circulate through freely, it will serve first rate for a drying shed.

Your yield of onions is excellent. It has been several years since we grew any onions from seed. We grow now altogether from sets. These are put out as early in the Spring as the ground can be worked. They are pulled in early July. This year we had 1⅓ acre planted in rows 2½ feet apart so as to permit of horse cultivation. From that block we marketed 603 five-eighths bushel baskets of onions. The average net price was $1.26 a basket. Net returns in round numbers were $760 for the 1⅓ acre of ground. We are now picking late tomatoes from the same piece of ground. Our crop was sold direct from the field. Italians pulled and topped the onions at 2½ cents a basket. The illustration, page 1203, shows onions being topped from a pile laid crisscross. This often happens when topping is being done by the day, but I notice that when Italians do the topping by piece work they lay the onions in even piles with the tops all one way. This greatly facilitates topping and enables the thrifty worker to get a larger number of baskets to his credit.

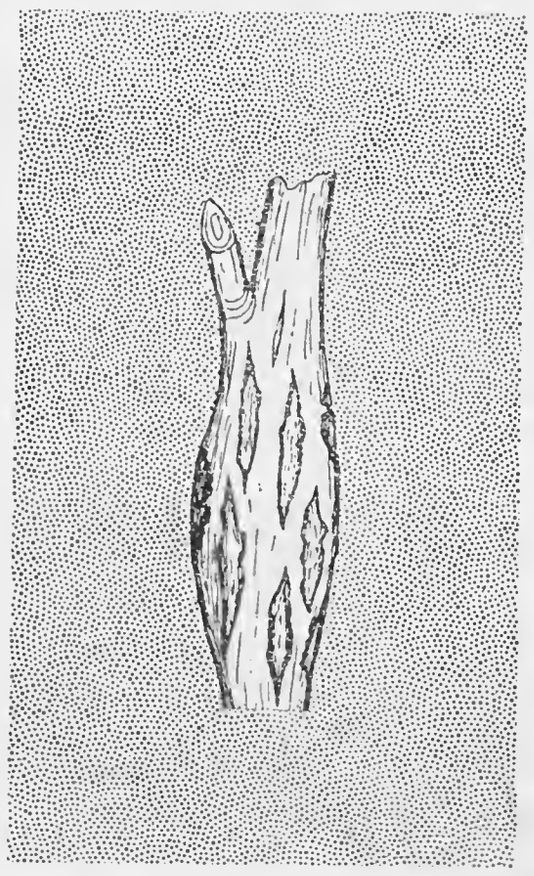
TRUCKER, JR.

Gouty-gall of the Raspberry.

I SEND a cutting taken from a diseased red raspberry shoot. Upon opening there is either a small white worm or else it shows where it has been. We have a new patch of the berries set in a year ago. Beside them is an old patch, and they all seem affected in the same way. Can you tell me how and when the worm enters the shoots, and the remedy if any? F. A. H.

Lake View, N. Y.

The stems of raspberries are sometimes attacked by a small, white, slender grub that causes irregular swellings or galls on the canes. These swellings are from one to two or three inches in length, larger in the middle, and gradually tapering toward either end. The bark over the



GOUTY GALL OF RASPBERRY. Fig. 524.

swelling is usually discolored, roughened and split lengthwise. The larva causing the trouble may be found in its burrow just under the bark of the swelling, but usually, especially toward Fall, it is several inches above the enlargement. The grub, when full-grown is from five-eighths to three quarters of an inch in length, with a brownish head and two small brown hooks at the tip of the abdomen. The full-grown parent insect is a beetle about one-third of an inch in length. Its body and head are black with a bluish lustre, but its thorax or "neck," is a coppery red, hence its name the "red-necked caneborer." The beetle is present and active on the berry bushes from the last of May until August. Its scientific name is Agrilus ruficollis, the last word of which means "red-necked."

LIFE HISTORY.—Probably the eggs are laid mostly in June, although some are evidently deposited later. The egg is inserted in the bark at the base of a leaf on the new growth. When it hatches, the young grub enters the bark and bores in the sapwood of the cane working upward in a spiral around the stem, thus girdling the canes and causing them to enlarge and form the gall. Toward Autumn the grub burrows to the pith, where it hibernates several inches above the gall. In the following Spring the grub transforms to a pupa and emerges as a beetle in late May or June and perhaps later. This insect is a native pest and is common on wild raspberries, blackberries and dewberries. Fortunately, it is subject to the attacks of two parasites that probably aid greatly in holding it in check.

CONTROL.—It is obvious that the grub cannot be reached with insecticides of any form, nor is it practicable, apparently, to control the parent beetle. At least, we know little of its feeding habits and infer that it would do little if any good to spray the bushes with a poison. Thus we are forced to take protective measures of another kind. In the first place, wild raspberry, blackberry and dewberry canes within reasonable distance of the cultivated plants should be destroyed to prevent the beetles from breeding without restraint. In the second place, all infested canes among the cultivated plants should be cut out and burned sometime before April or May. This process may thin the canes considerably in case of a bad infestation but the chances are that such canes would die anyhow and more than that, they would serve as means for the greater increase of the insect during the subsequent season. Hence it is important to begin the work of cutting and burning at once and to do it thoroughly.

29 YEARS 350 ACRES.

MANURES AND FERTILIZERS.

Damaged Hay as Fertilizer.

I HAVE about 30 tons of last years' hay in three stacks within one-third mile from the station in New Jersey. It was improperly stacked and is now suitable only for bedding. I do not know that I can get $10 per ton for it. Rather than sell it for less, having use for manure, I have decided to turn it into manure if I can do so expeditiously and advantageously. What would it cost to turn this into manure and just how would you advise doing so in order that it may be used on the land next Spring?
E. E. S.

A ton of Timothy hay will carry 25 pounds of nitrogen, 11 pounds phosphoric acid and 20 pounds of potash. At present prices this means a value of a little over $10 in commercial plant food. If you have stock you can use the hay freely for bedding, let it absorb the liquids well and keep it well mixed through the manure pile. If there is but little manure put the hay in loose piles in the barnyard and keep it well wetted down. Lime would hasten decay but it would drive off too much nitrogen. The wet hay will be fit to use by Spring.

Forest Leaves for Fertilizer.

I HAVE recently come into control of a 60-acre farm in Van Buren County, Mich. About 35 acres of this tract are timbered thickly, and I find a thick layer of leaves covering the ground throughout this timber land. It is my intention to use the woods for pasturing stock during the coming years, and I would like to learn how best to dispose of the leaves which have accumulated during the past years. I shall probably put in a few sheep to help clear away the shrubs and brush, but am wondering if the leaves would be of any value as a fertilizer in the cleared part of the land if raked and plowed under this Fall or next Spring. W. W.

These leaves, if well rotted, would have somewhat the same composition as manure. They will need the addition of lime, as they are usually quite sour. It will hardly pay to rake up and haul the dry leaves. They are too light and bulky to handle economically. After they have rotted or matted down on the ground they may be scraped up and spread like manure on cultivated ground, but we should always use lime with them.

Sheep Manure for Garden Use.

WHAT is the proper way to use sheep manure to the best advantage on a home vegetable garden? That is, when should it be used, at the time of planting or at some stage in the growing season, and about how much?
Jamaica Plain, Mass. J. M. S.

In a general way sheep manure is too expensive to use as a general fertilizer in gardens. Many people find it very useful as a top-dressing for lawns, for use in growing tobacco, or in glass-house gardening. As a rule, however, market gardeners do not buy sheep manure to any large extent, as they think it is possible to obtain plant food cheaper in other forms. It is safe to use sheep manure at any time, and in almost any quantity. Its effect is rather slow as compared with soluble chemicals, and as it supplies organic matter, and is a bulky manure, it may be a desirable thing to use in small gardens. The prices run from $20 to $60 per ton, depending upon analysis, and at these figures it would not pay as a practical fertilizer, except upon special crops, or very intensive gardening. We should prefer, if unable to buy stable manure, to use a good chemical fertilizer in addition to cover crops, or any green or growing matter plowed into the soil with lime.

Killing Seeds in Manure.

WILL you tell me how to treat seeds in stable manure before putting on land, so that the seeds in manure may not sprout again? G. M. W.
Canandaigna, N. Y.

If the manure is piled and heated and then turned and piled again and treated in this way till rotted there will be few seeds left alive. Of course there will be some loss in the manure, for I have always found that the best way to use manure is to get it out on the land as fast as made, and then fight the weeds early and kill them as they start. But in garden work it always pays to get the manure well rotted; I have some now undergoing the heating and repiling process for use on the garden in early Spring when it will be perfectly fine. I do not mind the weeds, for I kill them as soon as they start. W. F. MASSEY.
Maryland.

Our method of treating manure has been very effective and simple. We purchase it by the carload and pile about four feet deep, tramping very firm and adding enough water so as to prevent firefang. In hot weather this watering is very important, and a carload will require a large quantity. We usually have three or four men forking the manure and one man tramping and watering with a one-inch hose. The manure is then left to heat thoroughly for about one week, when it is turned again and more water added. A third turning will make it in better mechanical condition for some purposes, though not necessary to kill weed seeds, as we have found two weeks usually kills all, or very nearly all weed seeds. ELMER J. WEAVER.
Pennsylvania.

We do not have any special treatment for stable manure to kill the weed seed it contains. The manure we use for hotbeds and cold frames is hauled out in the Fall at any convenient time, and turned once, if possible, before freezing weather. It is turned again in the Spring before going into the beds. The fermentation and decay that takes place in the manure not only makes it fine but also, I believe, kills many weed seeds. If we were trying to eliminate the weed seed nuisance in manure we would use cut corn fodder (the waste left after feeding) for litter. As it is we have a bountiful supply of rough hay from low meadows and utilize all we can of it for making manure. The weed seeds it contains are in one way a nuisance, but in another a sure guide as to the thoroughness of cultivation.
New Jersey. TRUCKER, JR.

Value of Air-slaked Lime.

IS air-slaked lime anything but an indirect fertilizer? Has it, in itself, any direct fertilizing value, or does it only set free in the soil plant food and thus become what is known as an indirect fertilizer? Of course I know of its value as a sweetener of soil and also of its mechanical effect in lightening heavy soils, but what I wish to know is, has air-slaked lime available plant food in its makeup? R. C. R.
Salisbury, Conn.

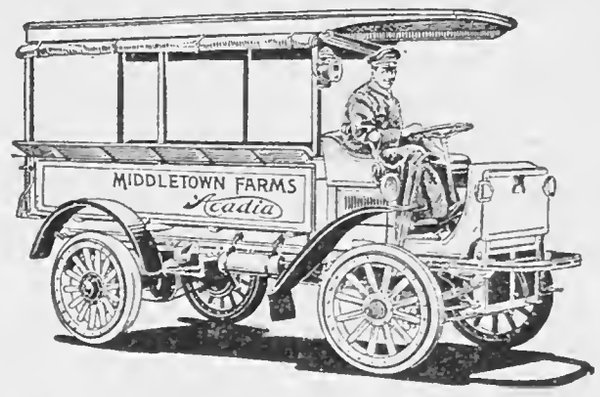
All plants contain lime as is shown by the analysis of their ashes. Most soils contain enough lime to supply the plant food needs of the crop and when phosphates are used a fair supply of lime is added. In the great majority of soils the need of available lime for feeding plants is much less than that for either potash or phosphoric acid. Air-slaked lime is available for feeding plants, but its greatest service is in acting chemically and mechanically upon the soil.

The Adsuki Bean.

A PLANT immigrant from Japan that seems likely to prove a most desirable addition to American agriculture, is the adsuki bean, which has been successfully grown on the Government's farm at Arlington, Virginia and at many other places. Its most valuable feature lies in its large yield of seed. Owing to its texture, the bean is easily ground into meal or flour and has proven far superior to any other bean for that purpose. Its flavor is delicate and it lacks any objectionable "beany" taste. The adsuki bean is a most popular food in Japan, and there seems no reason why a food so rich in protein should not become popular in the United States. A statement from the Department of Agriculture says the average yield per acre of the best varieties of the adsuki bean at the Government's farm has been about 25 bushels. The bean is a Summer annual requiring about the same climatic conditions as the common bean. The plants are bushy in habit, growing from 1½ to two feet high according to variety and soil. The beans are not only prolific, but ripen evenly and do not shatter readily. It has been evident, however, that these beans cannot compete with either cowpeas or Soy beans as hay producers. Their initial growth is slow and their total yield of herbage inferior.

VENTILATING AND COOLING A CELLAR.—In the house which I recently built there is only one small window in the room intended for storing fruit and vegetables. To prevent wilting of fruit, this room has the natural dirt floor. The following device helps to ventilate the room in a very satisfactory manner. From the lower half of the window extending to near the floor is a long box made of half-inch lumber. In cool weather the warm air passes out the open upper half of the window and cool air passes down the long box to take its place. When well cooled down to near freezing the whole window is tightly covered on the outside. The cooling-off process needs to be repeated occasionally with changes of temperature. W. J. B.
Amherst, Mass.

Dairymen and Fruit Growers Profit by Use of *Autocars*



Save Cost of Rail Shipments—Deliveries More Prompt

THE quickness with which the *Autocar* carries its loads to market, with less handling and less expense than rail shipments, explains its growing favor among dairymen and fruit growers.

The Middletown Farms, of Middletown, Del., have had an *Autocar* four years. They used to ship their milk and cream by rail to Wilmington, 25 miles away. Their *Autocar* now takes care of this work, making some days as many as three trips to Wilmington and return, delivering right at the doors of their customers.

"We have found the greatest satisfaction with our *Autocar*" says the Middletown Farms. "It has brought very great improvement to our facilities."

The Autocar

"Used in Every Line of Business"

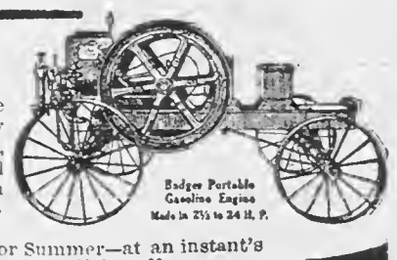
ALBERT HANSELL, a prominent farmer and fruit grower, of Burlington, N. J., bought an *Autocar* in February, 1911. In discussing it recently, he said:

"I bought the car because I became convinced that hauling my fruit to market with horses and wagons was too expensive. After several years of service with the *Autocar*, I know now that I was right. The car makes three trips to Dock Street, Philadelphia, 15 miles distant, in a day, while a team of horses is making one. And horses after such a trip, have to be rested up the next day. "My *Autocar* often makes three trips to Trenton and back in a day, a total distance of 120 miles. Since I have had the car, it has travelled more than 32,000 miles without a serious breakdown, and has added greatly to my profits through the quick marketing of my goods."

Why not become fully informed about the *Autocar* and its work? Write for our new catalog, Address Dept. R.

THE AUTOCAR COMPANY, Ardmore, Pa.
Established 1897 *Motor Delivery Car Specialists*

For Threshing and Ensilage Cutting



The "Badger" gasoline engine is the best power plant for the big jobs, like threshing and ensilage cutting. Reliability, plenty of power, steadiness and readiness, required for these big jobs, typify the "Badger." Made of the best materials; speed and parts made adjustable; the engine develops more speed than rated at less cost of fuel. Runs by gas, gasoline or kerosene. Consumes no fuel which is not turned into power.

The "Badger" is always ready to run—Winter or Summer—at an instant's notice. **Every part guaranteed for five years unconditionally.**

GASOLINE ENGINES

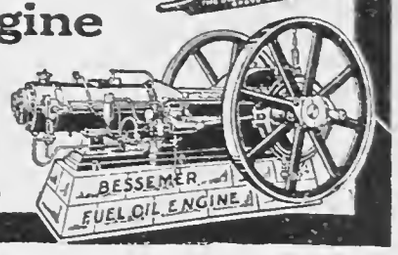
FREE TRIAL 30 DAYS BESSEMER NON KEROSENE CRANKING ENGINE

"The Masterpiece of the Largest Manufacturers of 2-Cycle Engines in the World"

Let the Bessemer do it: This sturdy little worker will pump your water, run your machine shop, buzz saw, sprayer, washing machine, and do all the other power jobs on the farm. And do it at small cost, because the Bessemer runs on kerosene, distillate, etc., and thus pays for itself in fuel saved. 2 to 8 H. P. Thousands are in use. 30 days' free trial. Immediate shipment. Write for Catalog "K." If you require a larger engine use the

Bessemer Fuel Oil Engine

Lower picture shows the Famous Bessemer Fuel Oil Engine. Widely used in irrigation, flour mills, factories, electric light plants, etc. Runs on cheap fuel and crude oils. No batteries or magnetos required; ignition is automatic after starting. 15 to 165 H. P. Special Catalog "O" free.



THE BESSEMER GAS ENGINE COMPANY
123 Lincoln Ave. Grove City, Pa.

The Jeffrey Lime-Pulver

Grinds Limestone on the Farm 2 to 3 Tons Per Hour

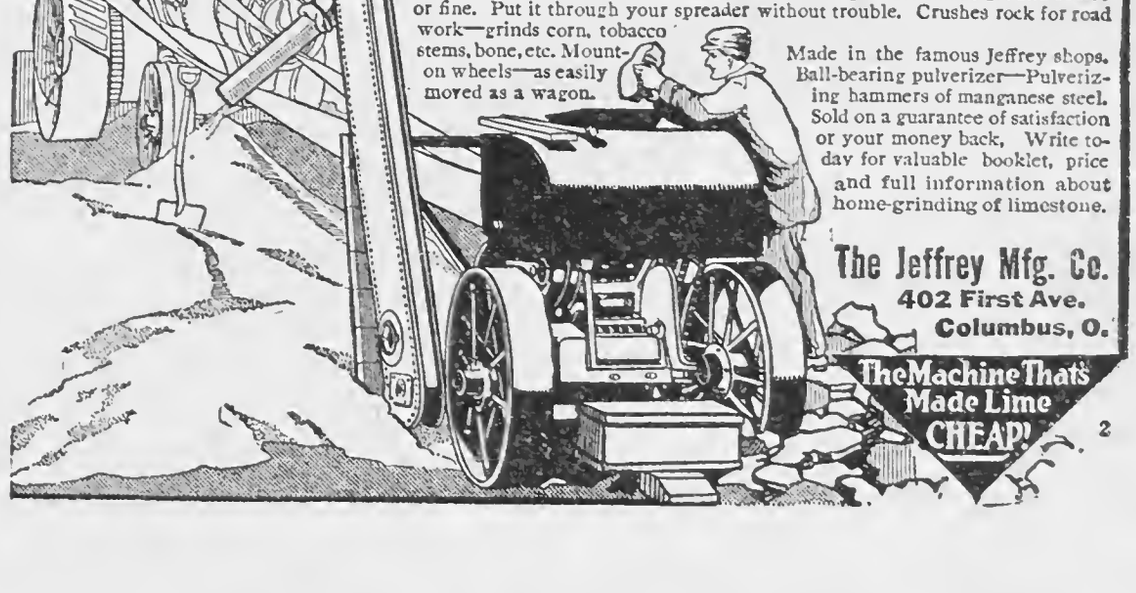
The day of cheaper lime is here. If you have lime rock available you can make fertile fields of land that is now sick and sour. No need to buy burnt lime at high prices that burns up the humus and wastes the Nitrogen in the soil. No need to buy ground limestone and pay for freight and hauling. Get a JEFFREY LIME-PULVER and, after quarrying the rock, grind it at a cost of 50c per ton. Dig out those rocks that prevent your cultivating your fields and make them enrich your soil—turn the stones into dollars! Grow clover, alfalfa and other legumes by giving your soil the lime it needs.

Saves From $1 to $2.50 Per Ton

It costs most farmers from $1.50 to $3 per ton to get ground limestone on their farm. With a Lime-Pulver you can grind your limestone for 50c and save from $1 to $2.50 per ton. In a short time the Lime-Pulver pays for itself.

Both a Crusher and Pulverizer

The JEFFREY Lime-Pulver is the machine that crushes and pulverizes. It takes big rocks 4 inches thick and 11 inches long and reduces them to powder. Grinds from 2 to 3 tons per hour. The product can be ground coarse or fine. Put it through your spreader without trouble. Crushes rock for road work—grinds corn, tobacco stems, bone, etc. Mounted on wheels—as easily moved as a wagon.



Made in the famous Jeffrey shops. Ball-bearing pulverizer—Pulverizing hammers of manganese steel. Sold on a guarantee of satisfaction or your money back. Write today for valuable booklet, price and full information about home-grinding of limestone.

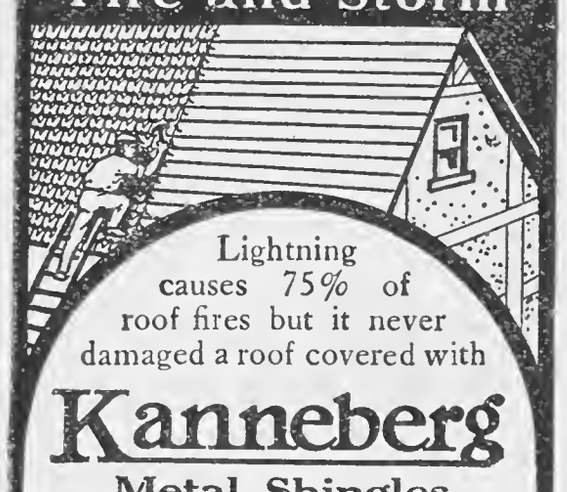
HOME SAFETY against Lightning, Fire and Storm



Lightning causes 75% of roof fires but it never damaged a roof covered with

Kanneberg Metal Shingles

"We Pay the Freight"

They are proof against fire, rain, snow, heat and cold. Need no repairs, because they will not rot, rust, crack, buckle, curl nor fall off. Can be laid on low pitch roofs and always look well. Give clean cistern water. You can save big money by using this almost indestructible roofing. Buy direct from the factory. Put it on yourself easier and quicker than wood shingles.

Send for our catalog and rock bottom prices before you buy any roofing. Kanneberg Shingles make the cheapest roof you can buy, judged by service, the real test. Come in single shingles, 8 to a sheet, or in clusters 2 feet by any length from 5 to 10 feet. Many designs and sizes. Write for catalog today. Be sure to give *dimensions of your roof* and we'll tell you how to get the best roof at lowest cost.

FOR SALE BY
Rural New-Yorker, 333 W. 30th St., New York

EVENTS OF THE WEEK.

DOMESTIC.—The Marconi wireless station at Siasconset, Mass., was closed by Federal order Sept. 25, because it declined to recognize the Government's right of censorship. The Navy Department took no cognizance of the fact that the Marconi company had appealed to the Federal court and filed an application for an injunction to restrain the naval officers from closing or censoring the station.

Fire in a storage warehouse and knitting at 85 Meserole St., Williamsburg, New York City, Sept. 25, caused a loss of $100,000.

Forty-eight additional coal operators of Colorado have sent a letter to President Wilson objecting to some of the principal features of the Federal plan for a three-year truce in the strike war. Both sides—the mine owners and the striking miners—are making preparations for a continuation of the siege that has lasted more than a year.

A fire in a crowded block of old tenement houses on East 11th St., New York, Sept. 27, caused the death of 60 horses in a livery and undertaking establishment, and resulted in a total loss of $75,000.

A large wireless plant near Hollister, San Benito Co., Cal., is under investigation by the Navy Department, under suspicion of violating neutrality.

Nine counties of twelve in Kentucky, which voted on the liquor question, Sept. 28, returned large "dry" majorities, while only three remain "wet." One county, Anderson, was close and went "wet" by a majority of 64 votes. The biggest vote received by the liquor people was in Fayette County, home of many of the biggest distilleries in the country, which gave a majority of 3,264 for the "wets." The three counties which voted to sustain the liquor questions contain distilleries.

Health Officer Joseph J. O'Connell of New York City issued, Sept. 28, an order to his boarding officers to give particular attention to all passengers who may arrive here from the Adriatic east of the Italian boundary, the Ionian Sea, the Ægean Sea, the Mediterranean east of Italy and the Black Sea, cholera having been reported in epidemic form in eastern Russia, Austria and in the eastern theatre of war.

Three persons were killed and 20 persons injured, one probably fatally, in a gunpowder explosion in the plant of the Pain Fireworks Display Company 1316 South Wabash Ave., Chicago, Sept. 30.

Delegates to the Southern Cotton Association at New Orleans decided, Sept. 30, not to grow any cotton in 1915 in the six States represented at the convention and to ask Legislatures to prohibit planting.

WASHINGTON.—The Senate passed the Alaska coal lands leasing bill, Sept. 26. It authorizes the Secretary of the Interior to survey all of the coal lands of the Territory of Alaska, beginning with the Bering River and Matanuska fields. After the surveys have been completed the President is directed to reserve 5,120 acres in the Bering River field and not more than 7,680 acres in the Matanuska field. As to the reserved lands, they can only be mined in the discretion of the President to meet an emergency created by "an insufficient supply of coal at a reasonable price for the requirements of Government work, construction and operation of Government railroads, for the navy, for national protection and for relief from oppressive conditions." The unreserved coal lands are to be divided by the Secretary of the Interior into tracts of forty acres or multiples thereof, but in no case exceeding 2,560 acres in a single leasing trust, and thereafter to be leased by the Secretary to any citizen of the United States, or any corporation of the United States.

Mrs. Woodrow Wilson's dying wish that the worst slums in Washington be abolished was finally realized, Sept. 25, when the President signed the bill clearing the alleys of dwelling places. On her death bed Mrs. Wilson expressed the hope that the bill would be passed, and both houses of Congress acted. Although it differed in some particulars from the measure as Mrs. Wilson originally championed it, the President decided it accomplished the principal purposes sought.

Peace commission treaties with Great Britain, France and Spain were ratified, Sept. 25, by the Senate, making twenty-five in the series negotiated by the State Department which have been approved by this government. A similar treaty with China was favorably reported by the Committee on Foreign Relations, but action was deferred by request of several Senators, who wish to discuss it thoroughly in view of the situation in the Far East, involving Germany and Japan at Kiao-Chau.

THE EUROPEAN WAR.—Sept. 27 12 cities and towns were attacked from the air by the Germans. Their aerial warcraft bombarded Paris, Warsaw, Antwerp, Ghent and numerous small towns in Belgium. In Warsaw their Zeppelin was shot down and its crew captured. Four persons were killed, two in Paris, one in Ghent and one in Dynze. Several were injured, but the damage to fortifications and public works was comparatively small. The objects of German attacks from the air appeared to be the Eiffel Tower, in Paris, the Antwerp fortifications and ammunition depots in France and Belgium. A hospital in Belgium was damaged and patients and nurses endangered.....Sept. 30, the eighteenth consecutive day of the battle of the Aisne, little change was reported officially, but there was no apparent gain by the Germans. Censorship was very rigid. The fighting continued day and night, and this conflict is likened to the battle of Mukden, which lasted for 20 days. Casualties on the Aisne are enormous and are already reckoned at over 200,000.....The Russians were advancing in central Galicia Sept. 28. The Russians have crossed the Carpathian Mountains, have captured Uzsok with a number of guns and prisoners and from this point they have descended into the plains of Hungary. .....Germany is increasing forces in Belgium, and concentrating an attack on Antwerp, which, if taken, would give a naval base for attack on Great Britain. Fort Waelhem, one of the strongest of the fortifications around Antwerp, has been partly destroyed by an all night bombardment by the Germans. The Belgians the next day attacked the German besiegers and drove them from their position. A report from Antwerp says that men in balloons are finding the positions for the German gunners in their firing upon the Antwerp forts..... Malines has been reoccupied by the Germans. Oct. 1 they renewed the bombardment of Lierre (a manufacturing town nine miles southeast of Antwerp) and Heyst-op-den-Berg (a town near Lierre.) In Lierre the tower of the Church of St. Gommarius, the convent of the White Sisters and some houses have been struck by shells. Most of this district has been completely deserted by the civilian population.....The British steamship Indian Prince has been sunk at sea by the German converted cruiser Kronprinz Wilhelm. The master and fifteen men of the crew of the Indian Prince have been landed at Santos, Brazil, by the German steamship Prussia.....The British Admiralty gave out the following figures, Sept. 28: Captured, destroyed, interned or otherwise put out of commission, British, 94 vessels, of 232,310 tons, or 1.2 per cent. of total tonnage; German, 387 vessels, of 1,140,000 tons, or 23.6 per cent. of total tonnage..... Great Britain has asked the United States to investigate who was responsible for sending the American ship Lorenzo with coal to the German cruiser Karlsruhe in British West Indian waters. The Lorenzo was caught by a British cruiser. The Departments of Commerce and Justice will determine who may be prosecuted under the neutrality laws.....The British Admiralty announced, Sept. 29, that the German cruiser Emden has sunk four British steamships and one British collier in the Indian Ocean.....The Admiralty issued orders, Sept. 29, forbidding neutral trawlers to fish on the east coast of England. The order says that the neutral trawlers may continue their operations on the west coast. The order affects a large number of Dutch and Danish fishermen who use Grimsby as their base.....Many German firms who owe money to British exporters have sent intimations to their creditors that they are investing the money in the German war loan and that they will send scrip to England in payment of their trade debts. Swiss firms are being paid in the same way.....An Australian force has captured Kaiser Wilhelm's Land, the German portion of New Guinea.....Sept. 28, it was announced that a British force had captured Duala, capital of Kamerun, German West Africa, while Bonaberi surrendered to an Anglo-French force.....There are now over 150 German prisoners confined in the military fortress at Halifax, N. S. The last batch was brought in by the British cruiser Suffolk. They were taken from a steamer five miles off New York harbor. It is just 100 years since prisoners of war were last confined in Halifax.....Sept. 27 the Japanese defeated the Germans after 14 hours' fighting at Tsing-tau, China.....Spain has sent offers to France to care for 30,000 wounded in her hospitals, Madrid being prepared to care for 6,000..... An Italian fishing boat was sunk by Austrian mines 20 miles off Ancona, Sept. 28, and eight men were killed. The Italian Government has asked its Ambassador at Vienna to file a protest against the strewing of mines by Austria in the Adriatic. Italy has called to the colors three classes of reservists.

This part of Illinois (central) 35 miles south of the 41st parallel, has unusually poor grass and grain crops, owing to drought. Hessian fly, chintz bugs and a few isolated places of army worm. For this reason farmers must change their fields. Quite an acreage of wheat will be put out. The seeding commenced Sept. 28 to 30; late seeding, in order to have less fly to contend with. J. B. A.
Taylorsville, Ill.

Weather has been unusually wet for Western Montana; ground in splendid condition for seeding to wheat. A large amount will be sown. This is a dry farm section; wheat yields from 10 to 25 bushels an acre, oats about 30 bushels. Prices are, oats, $1 per 100 pounds; wheat 85 to $1 a bushel. No corn raised here; it is shipped in and retails at $1.50 per hundred. Ranchers are turning to dairying and stock as fast as they can. Creameries are buying the product mostly. H. T. A.
Montana.

CROP NOTES.

Sept. 19. Grain all thrashed, yield good. Grass catch fair to good. Pastures none too good, cows dropping off in yield, although fed in barns. Grain in store is, corn, $1.25; oats 60; feeds $1.60-$1.70. J. C. S.
So. Thomaston, Me.

Crops are looking fine in the southern part of Livingston County; think potatoes will average 150 to 200 bushels to the acre, some going better than 200. Butter 30 cents per pound; eggs about the same per dozen. Apples just a medium crop and no sale for them.
Dansville, N. Y. D. N.

Sept. 22. Thrashing is about done except the buckwheat crop, which is not all cut. A good many are digging their potatoes; early-planted potatoes are small, late potatoes are larger. The apple crop is good, but the demand is light. Not much hay is being sold. Butter brings in jars 29; eggs 26. Silos are nearly all filled. We have had a few light frosts. P. S. S.
Mayville, N. Y.

Sept. 26. New milch cows $40 to $80; fat cattle, live weight, 5 to 8 per pound; veal calves 9; hogs 8 to 9; lambs 6 and 6½; milk at condensery $1.55 for September; cheese 15½; butter, dairy, 30 to 32; Fall apples, 60 cents per bushel; plums $1.50; pears $1; potatoes 45; tomatoes $1; cabbage one to two cents per pound. Some hay is sold and brings this year about $14 per ton, pressed and delivered at station or shipping point.
Alfred Station, N. Y. D. L. L.

Sept. 25. Wheat brought to our elevator is $1.05 per bushel; oats 46; old corn 75; potatoes market price 80; onions 75; cabbage $6 per ton paid at factory. Pears from $3 to $4.50 per 11-peck barrel, according to variety. Butter 31 per pound from creamery in 50-pound lots, retail 37 cents per pound; this is in pound packages. Farmers are getting $1.55 for a eight-gallon can of milk, transportation costs 16½ cents per can; retailed in our town at seven cents per quart. Hogs, live nine cents paid by buyers. Timothy hay $14 per ton; oat straw $6 per ton paid by warehouse men; bran $25; dried malt $25; middlings $33. Milch cows are selling at private sale and auction from $75 to $125. Eggs 25; Spring chickens 15; ducks 13; apple crop a failure. G. K.
Arlington Heights, Ill.

Sept. 25. The staple farm products in this vicinity are corn, oats, Timothy, clover, potatoes, stock, butter, eggs, and poultry. Garden truck, while staple in a way, is not generally raised for market, being more particularly raised for individual consumption on the premises. A comparatively small amount of fruit is raised here, and it is considered a side issue by the farmers. The prices for live stock from day to day can be readily obtained by taking the Chicago market and allowing about 40 cents per cwt. for shipping expenses. It costs about three cents a bushel to ship corn and oats, so those prices can be obtained in similar manner. Butter sells at about 30 to 33; eggs about 22; poultry around 12; Timothy and clover about $10 to $12 per ton, and potatoes about 75 cents per bushel. F. N. V.
Amboy, Ill.

Our first frosts here, Sept. 12, 13, 14, froze water one-quarter inch thick on pailsful standing out. Year a good one, hay fair crop; oats good average; corn the same. Potatoes extra good crop; apples fair; plums and pears a small crop. Plenty of rain and pastures good. Cows in good flesh and native beef good and in good demand, 10 to 11 cents a pound by the side. Sheep and lambs fat and mutton good. One veal three months old over 300 pounds sold to local butcher last week for $32.50. Is it any wonder few calves are raised for cows? The war in Europe has, through the speculators, put prices away up: sugar eight cents; corn $2; feed oats and corn $2; flour $7.50; potatoes 60; oats $1.90 per 100 pounds; eggs 32; butter 32. B.
South Dorset, Vt.

The Winter wheat crop was large as a whole, by reason of large acreage. Thrashing was mostly done from the shock, and as the weather was dry it was all done in fine condition, with average yield of about 20 bushels per acre. Oats were the best crop in 20 years averaging around 50 bushels. Only two cuttings of Alfalfa as a rule, drought setting in in time to check the growth of the plant. Corn is a fair crop in the main, but some localities have none whatever, due to the rains being local showers. Rain came in time to allow plowing for wheat and a large acreage will be planted. Hessian fly did considerable damage to wheat this season. To avoid this our farmers are delaying seeding till later in the season. Probably not much will be seeded before Oct. 1. The price of wheat went to a dollar per bushel at one time, but is now quoted at 92 in our local markets. Oats 40; corn, old, shipped in, 80; potatoes 75; hay $8 per ton; wild hay is a very heavy crop. Live hogs around $8 per 100 pounds, and very scarce; cows $60 to $80; butcher cattle six to seven cents; other cattle very high; common Spring calves $20 to $30; butter 20; eggs 20; chickens 12½. The weather is hot, very hot the past week; pastures are fine and stock doing well.
Fairbury, Nebr. H. M. R.

San Diego Panama California Exposition

The right way to pick out a farm

TOO many men pick out a farm where they are; they take what they can find there. The right way is to decide beforehand on just the things you want in a farm, and then find the one that comes nearest to giving you these things.

You can do that—exactly that—if you visit the Panama-California Exposition at San Diego. There are 44,000,000 acres of the best land under the sky waiting for farmers, in the Southwest. It isn't all one kind of land, either; there's variety enough for every kind of farming known. And you can learn all about this land without moving out of your chair, if you choose; the Exposition authorities have gathered *all* the facts about *every acre* of these 44,000,000 acres, and these facts are ready in concise form to lay before you. That's the kind of an Exposition this is.

Here are some things you'll learn

The cost of the land per acre; the general condition and character of the land; the accessibility to water; the kind of crops it will raise best; the cost of labor; the markets, transportation, prices; the average expenses for maintaining a family, and of maintaining and running a farm like that; these and all other facts, things that you may not even know about the farm you now have, will be laid before you at San Diego.

Not only that. You'll see all kinds of farm machinery displayed; and if you step out of the building, you'll see this same machinery in actual operation in the field. You'll see intensive farming going on under all sorts of conditions.

Tomorrow rather than yesterday

The Panama-California Exposition at San Diego shows, not merely what has been done; but what can be done; it's an Exposition of tomorrow rather than of yesterday. Bring your family to San Diego; they'll get as much pleasure as you will; and as much profit. An experience they'll never forget. The Exposition opens January 1st, 1915, and keeps open until December 31st, 1915; a whole year. Come any time that suits you, you'll find things to interest you and give you information that's worth having, any time during the twelve months.

It's the greatest Exposition for the farmers of the country that the world has ever seen.

COPYRIGHT 1914 • CHARLES DANIEL FREY

VAN DEMAN'S FRUIT NOTES.

Quinces in Damp Ground.

I HAVE about an acre of sloping ground in a little valley where old half-wild quince trees bear profusely. It is very wet in Spring, but well-drained later. Nurserymen tell me the Bourgeat quince is especially adapted to wet ground. Is this so? What varieties do you recommend, and do you advise commercial planting in this situation. C. H. S.
Hempstead, L. I.

While it is true that quince trees will flourish in damper soil than most fruit trees it is well to have them where there is no standing water at any time of year. The soil mentioned may be too wet, and as it will do good to drain it anyhow I would suggest that this be done before planting quince trees of any variety. I do not know that the Bourgeat is in less danger of being damaged by wet soil than other kinds and would advise not to depend on any such supposition or report. The draining may be done very cheaply by the use of stone or even poles and brush put in ditches, but tile would be safer and much more durable. It will pay in any case.

Ameliaberta Peach.

I SENT a sample of four peaches to the U. S. Department of Agriculture for identification. They determined the variety as Ameliaberta. They were sold to me for Elberta. This is the first year they have borne any fruit. They are four years old. Are you acquainted with the Ameliaberta? Is it a reliable variety to plant? Is it as productive as the Elberta? I know it is not Elberta because that variety (Elberta) ripened two weeks before this did. It is a better flavored peach and a much better keeper than the Elberta. R. H. P.
Brooklyn, Md.

Although I have never grown the Ameliaberta it is said to be a very valuable variety in every way. There are a great many seedlings of Elberta now being grown and some of them are earlier and some later than the parent variety, but all resemble it in color, shape and size. A few are better in quality. If it is correct as to this variety being Ameliaberta there would be no mistake made in planting more of the same kind of trees. To make sure of having the same kind, trees could be propagated from those in bearing on the premises of the inquirer.

Barren Plum; White Grubs.

I HAVE a plum tree in my garden six years old that has bloom every Spring, but never sets fruit. I may be impatient as to results but have determined to give this tree one more year. Is there any remedy, or perhaps, something in the soil needed to produce fruit and not available? 2. My garden is infested with grubs, but I have no pigs to turn in to destroy them. Would bisulphide of carbon sprinkled on the ground do any damage to the grubs? After plowing one furrow I would sprinkle in the furrow and have plow follow immediately and cover, then sprinkle again and cover immediately Would formaldehyde give better results applied in same way? I have an idea that this method would destroy every other bug or insect, yet have my doubts about the grubs. L. R.
Louisville, Ky.

1. It may be that the plum tree in question is of a variety that does not pollinate its own flowers and therefore sets no fruit. As it does not bear it would be well to graft it over to some variety that is known to bear well in that locality. There must be such plum trees there from which scions could be taken, and some skilled grafter could set them next Spring in the barren tree. It would be a loss of time to dig out a fine tree that could so easily be made productive in a short time.

2. If it is true that the garden soil is affected with grubs they can be destroyed by repeated plowing or any frequent stirring or turning over of the earth. It would be very expensive and very likely, needless expense, to treat the soil with any kind of chemical, especially those mentioned. To be effective it would be necessary to saturate the soil and cover it with something for a time to keep in the fumes, which do the killing of animal life.

Late Peach; Jonathan Apple as Filler.

WHAT is the best October peach that I can plant in this section? Is there a good marketable variety maturing at that time? The Krummel is very highly advertised. What do you know about this variety? Would an October peach have to compete with any Georgia or New England peach if I shipped to northern markets? The elevation would be about 800 feet. 2. Will it be profitable to plant as fillers Jonathan apple trees between Winesaps? The Winesaps were planted last year 36 feet apart. G. M. J.
Nelson Co., Va.

1. Among the very late peaches there is none of the older varieties that excels the Salway, for it is a yellow freestone of high quality, good size and ripens after nearly all the rest are gone. The tree is a good bearer and has no special faults. Krummel is a yellow freestone that ripens 10 days or more later than Salway and is one of the very best and most profitable of the very late peaches, especially for the southern regions where the ordinary or Persian type succeeds. The Heath Cling is an old favorite and is not only large and of a creamy color with a beautiful blush but is of the highest flavor. The trees are among the surest and heaviest bearers. There is no peach that I know equal to it for canning, for the flesh is firm and the flavor peculiarly rich and delicate. I would plant all of these kinds. As Shipman, Virginia, is near the central part of the State, and the climate and soil are well adapted to peach culture, as well as for other fruits, it would seem to me that the time of ripening of these late varieties would fit into the markets very well. But there is no doubt that they would have to compete with the peaches of other more northern sections to some degree. However, the northern grown Elberta and others of that class are usually sold so far north that there would be open markets sufficient to take all that are likely to be grown of the very late varieties in the region of Virginia.

2. Jonathan is a splendid apple and the trees bear about as early as Winesap but it is not yet demonstrated that it is good to cross-pollinate the Winesap blooms. Besides, it has the serious fault of having black specks on the skin that are a hindrance to the sale of the fruit. Grimes would be a better variety to use as a filler among the Winesap, because it is not affected with any special disease, except a trouble with the roots, the flowers are very strong in pollinating ability, the trees bear early and well and the fruit brings high prices in market. Besides the apples are very distinct in color from Winesap and would not get mixed by mistake in gathering as the Jonathan would.

Keeping Pears.

HOW can I keep pears so as to have them fresh about the holidays? I want to keep them for family use. We have no cold storage. J. W. M.
Schuylerville, N. Y.

There are a few varieties of the pear that may be kept until midwinter or even later as apples are kept, without the aid of cold storage, but it is not possible to keep any but the very late kinds in that way. Among them are the Lawrence, Nelis, Morcean and Easter, but such as the Sheldon, Anjou and Bosc are very difficult to keep unless in cold storage. It all depends on the varieties J. W. M. has to put away for Winter use, and the way he handles the fruit. The pears should be gathered when the stems will part from the wood easily by lifting upward and the greatest care used to prevent all bruising. The place of storage should be as cool as possible and free from changes of temperature. If each specimen is wrapped in paper the fruit will keep better than without this treatment.
H. E. VAN DEMAN.

A Vacation at Grape Picking.

WHAT are the chances of my getting work for a week or two here?" asked a Pittsburgh attorney who sought to make his vacation pay its way. Both he and his wife found work within half an hour. Although both were unfamiliar with fruit gathering, before two weeks were passed they were good pickers, and had paid more than all their expenses. Another young woman with whom the writer is acquainted is a telephone operator, but at the opening of the berry season she leaves her work, and starts in with the strawberry season and ends picking grapes. This young woman earns from $18 to $20 weekly. There are many young women and men of good families who visit the lake shore grape sections during the picking season. They come from interior towns, and the change not only is interesting, but they go home with more money than had they been teaching school or working the same time as bookkeepers or stenographers. The prices paid at North East, Pa., are as follows: 1¼ cents for eight-pound baskets of grapes; 10 cents per eight-pound basket of cherries; 1¼-1½ cent a quart for strawberries; two cents for blackberries, and 2½ to 3½ cents for red raspberries. Good pickers should average from $12 to $15 per week. One of the best which has been heard of a grape picker has been $4 per day, and the average of this picker was about $22 a week. The growers in many instances provide quarters for the pickers or drive to town, get them, and return them at night. Many pickers have tents, and camp on the grower's premises. There is generally a shortage ot pickers. Two years ago this shortage was very great, and grape picking lasted in some vineyards several weeks longer than was desired. This year, at North East, up to present, there was sufficient supply of help in most instances for all work, except red raspberries.

A Combination Cover Crop.

I HAVE a piece of light, sandy loam, naturally rather poor. I dressed it heavily with corn manure for several years, and while much improved, it still lacks humus. At present I have no stock, so I am trying to fill the want by cover crops. I have more than I need to plant at a time, so last Fall I sowed rye on a part of it, which I plowed in this Spring and sowed to oats and peas, plowed again this Fall, and sowed to rye, to plow in next Spring. The trouble with this combination is that the oats and peas are ready to plow in too early to sow Winter rye. Would rape be better, letting it die, or can you suggest a better combination? I wish to plant a part and have cover crops on a part, alternate years, with the primary object of increasing the humus.

It is rich enough from the dressing I have used to grow fine crops of nearly all kinds. Fruit and berries do splendidly, but it does not hold the moisture as well as I wish. I also sow rape where my peas were, and among my berry bushes, after cleaning them out, and rye among my corn about this time. A. D. M.
Woodfords, Me.

In this case we should plow under the stubble of oats and peas, and sow a combination of buckwheat, rape and rye. The buckwheat and rape will start first and make a heavy growth. At first the buckwheat will be killed, and the rye will begin to grow faster. The rape will die out during the Winter, and the rye will grow in Spring. In some cases the rape is left out, buckwheat and rye being seeded alone. This method kept up year after year, cultivating half the ground each year, will surely improve the soil. We should use annual applications of about 500 pounds of lime when plowing under the rye, except, of course, when potatoes are planted.

Slitting Bark for Blight.

NOTICING a suggestion made by your correspondent, Walter C. Black, of New Jersey, for the cure of twig blight by slitting the trunk of the apple tree, does he have any information as to the time of the year when this should be attempted? How long and how deep a slit should be made, and with what instrument? W. H.
Altoona, Pa.

The experimenting for twig blight was done about August 1, 1913, and was done with the point of a sharp knife drawn on four sides of the main trunk, cutting through the bark only, no bark was taken out. The knife was also drawn down the side branches on two sides. My informant did his cutting earlier, about June 1st, I understand. WALTER C. BLACK.

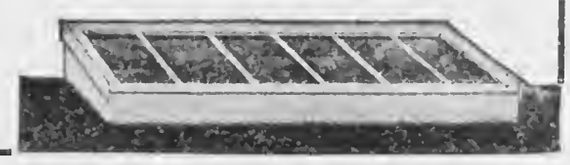
Lutton's Miniature Glass Gardens
Ordered today will reach you in time to prepare a garden that will supply your table with delicious vegetables and beautiful flowers throughout the long winter months. Frames shipped complete, ready to put together. Quickly assembled, easily ventilated. Built of the same materials as the large ranges of glass which we erect in all parts of the country. Make winter gardening a continual source of pleasure and profit. We manufacture 2, 3 and 4 sash frames, single and double glazed, besides the specials listed below. Complete planting instructions with each frame. Prompt shipment and satisfaction guaranteed. Send your order today.
Special No. 3 Diminutive Greenhouse
Covers 40 sq. ft. of garden space. Probably high enough to receive some of your tallest pet plants. Six large lights of extra heavy glass to each sash. Hinged at top. Easily ventilated, strongly made. Nicely finished, quickly put together. Portable. Carefully packed. Price complete. Freight prepaid anywhere in U. S., $21.00. For double glazing, $1.50 extra.
PRICE DELIVERED $21.00
Special No. 2 Beginner's Garden
To meet popular demand, we manufacture this special sash and frame. It's 8 ft. 4 in. long and just wide enough to put in a 3 ft. space. Sash has six large lights of extra heavy glass so that plants receive the maximum of life-giving sunlight. Carefully packed, easily set up. Price complete, freight paid anywhere in U. S., $10.50. For double glazing, $1.00 extra. Order yours today.
PRICE DELIVERED $10.50


Our free catalog sent immediately for the asking. Write for it today.

225-7 Kearney Ave., Jersey City, N. J.

NOTES AND COMMENTS.

SWEET CLOVER IN MARYLAND.—Riding recently through the lower section of Somerset County, Md., I noticed that all along the roadside and on the ditch banks there was a rank growth of the so-called Sweet clover growing four or five feet high. I called the attention of a companion from Somerset, who was taking me in his automobile, and he seemed surprised that anyone would call that rank weed clover. Of course the Melilotus is not clover, but people have got in the habit of calling all leguminous forage crops, clover. But I noticed that even in fenced pastures the stock seemed to let the Melilotus alone. In fact it is the general experience that cattle do not take to it readily, but get fond of it after they have got to eating it. My own opinion is that here in Maryland we do not need the Sweet clover, as we can get better forage from cow peas, vetch, Crimson clover and Alfalfa.

PLOWING UNDER GREEN CROPS.—The cut on page 1099 shows rye in a stage of growth that I would never allow if wanted for turning under. I would always turn it under when little over knee high. It has then done its part as a Winter cover, and if a disk harrow is run over it both ways it is easy to turn it under properly. With a tall headed growth turned under in a mass the plant has got into the strawy stage, and decays much more slowly, and the solid layer of straw may cause damage in dry weather to a hoed crop by cutting off the rise of the capillary moisture, while the green rye, well chopped into the soil before plowing, will not be in such a solid mass, but will be mixed with the soil. The moisture will not be checked and the green rye will decay rapidly. The disk harrow beats the chain.

THE JOHN BAER TOMATO.—This tomato was sent out with the claim that it was the earliest of all, and that good plants set in the open ground would give ripe fruit in 30 days. Now I had fine plants, started early in the greenhouse and hardened off in cold frames. They were set in the open ground the last of April, rather later than we usually set here. The first ripe fruit was after the middle of July, while the Earliana was ripe the last of June. I have not said that it is not a good tomato, but it resembles Chalk's Jewel very closely, but here was later than Chalk's. My plants made a fine crop of smooth and good fruits, and I shall grow it another season right alongside of Chalk's Jewel. All tomatoes were a little later here this season on account of the extremely dry weather, but all varieties were alike affected by this, and the John Baer ripened at same time with the big Brimmer, which seems to be a selection from the Ponderosa, and we all know that Ponderosa is not early. The John Baer is a good smooth and solid tomato, but here it cannot be called early. The fruit is certainly better than Earliana, but the Langdon strain of the Earliana is quite smooth, and coming in so much earlier is far more profitable for the market grower. In fact the market here was well supplied with Earliana before there was a single ripe fruit on my John Baer plants. I am glad to know that it seemed earlier with Mr. Weaver and I shall grow it, early or not, because of its good cropping and smooth fruit. At the Louisiana station they considered it identical with the Chalk's Jewel.

GREEN ONIONS.—The Egyptian top onions may be best in New Jersey, as stated by Trucker, Jr., but here I plant sets in September of the onion sold by Norfolk seedsmen under the name of Queen. This is not the Early Queen of the Northern catalogues, but is more like the Pearl, but is better and earlier than the Pearl. I have often had them ready for bunching the last of February, and have never found any onion better suited for the green bunching crop. Then I plant the Yellow Potato onion sets at same time, and after the Queen plants are used up the offsets of the Potato onion come in very nicely for green onions, as they clean off perfectly white, and the main bulb can be left to mature, and coming in ripe long before the Northern seed crop will pay very well. In fact I sold them for $2 a bushel this Summer.

W. F. MASSEY.

Maryland.

Defective Ears of Corn.

I SHOULD be glad to know whether the absence of any particular constituent of soil fertility is indicated by the failure of ears of sweet corn to fill out at the end of the ear. My corn, Golden Bantam, which I have raised for a number of years, is of uniformly excellent flavor and the ears well filled out over, say, three-quarters of their length. The remaining quarter, however, is practically devoid of kernels, or at least they are so small at the time the remainder of the ear is fit for picking that there is a wastage of that end of the ear.

J. B.

On general principles this indicates a lack of both phosphoric acid and potash. The cob of the corn is very high in potash while phosphoric acid is the vital principle in all seeds. In such case we should use a mixture of three parts fine bone and one part muriate of potash.

Dodder on Alfalfa.

THERE is an air plant, which we call in this locality "dodder," which is destroying the Alfalfa. It seems to feed on the Alfalfa and sucks the life out of it until it finally dies. It is a long vine, without leaves, and runs all over the top of the Alfalfa. Can you tell me how to get rid of it?

G. F. B.

Covington, Ky.

This dodder is a plant parasite, which grows on the plants of clover or Alfalfa and strangles them to death. It is usually introduced through the seed. A good many samples of Alfalfa in particular have been examined and found to contain dodder. Since the government began its investigations, the Alfalfa seed is generally cleaner than it was before. This dodder is such a pest that no farmer should buy cheap clover or Alfalfa seed, and it will be well to have a sample of the seed examined by the experiment station before putting the seed into the ground. In cases where the dodder extends all through the field, the best plan is to plow, give thorough tillage, and reseed. If there are only patches here and there, the treatment is to mow these patches off, taking two or three feet on the outside of the dodder, rake the grass together and burn it. In this way the dodder may be cleaned out when it has not spread too far, but as stated when the field is badly infested, the best plan is to burn it all over and then plow and reseed.

Gathering and Drying Citrons.

WHEN are citrons ready to take off the vine? 2. How can I sugar cure citrons?

J. C. W.

Hyattsville, Md.

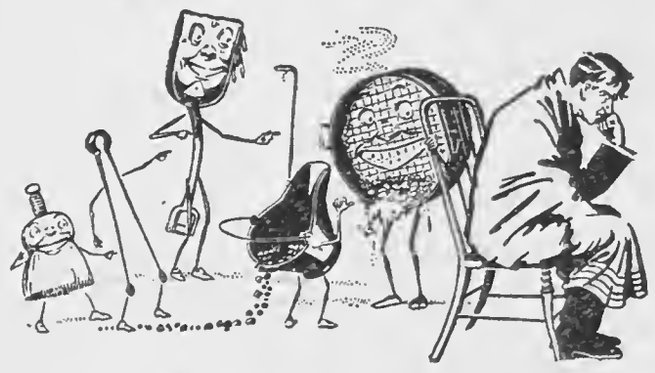
The experienced can tell at a glance by the appearance of the rind when a watermelon or citron is fully ripe, but the inexperienced must look for other signs of ripening, of which there are three that are considered unmistakable. The part of the fruit that comes in contact with the ground is as a rule a greenish white, while the fruit is in the green or unripened condition, and is perfectly smooth to the touch, but when the fruit is ripe, the part next to the ground assumes a yellowish cast and becomes scaly and rough to the touch. This is an unmistakable sign that the fruit is ripe enough to pick. The rind of the green fruit is tender and quite easily punctured by the thumb nail, but when the fruit is ripe the rind is tough and difficult to puncture in this way. Still another sign is present that is fairly reliable, but not always so. At the base of the stem, or axil, there is always a curl or little tendril. This remains green until the fruit approaches the period of ripening, when it begins to turn brown, and is usually dry and hard when the fruit is fully ripened, though not always.

How to Preserve Citron.—Cut the citron in thin slices, pare off the outside rind and take out all the seeds, put in the preserve kettle with water enough to cover it; boil until it can be pierced easily with a fork, skim it out and strain the water, placing back in the kettle. Allow three-fourths of a pound of sugar to a pound of citron; dissolve the sugar in the liquor, cut three or four lemons and boil until it becomes a thin syrup, then put in the citron and boil until the citron is transparent. Then it is done. Now lift the citron out of the kettle with a ladle or draining spoon, and place on a wire tray, and when dripping has stopped sprinkle powdered sugar thickly all over the pieces and set in the sun or warm oven to dry. When thoroughly dry it is to be packed in small wooden boxes and set in a dry, cool place.

K.

Genuine heating—care-free!

While you are trying to coax scant comfort out of your old-fashioned heating device, glance behind you at the army of petty annoyances you have many years endured, and which already cost you more heating-dollars than required to buy a care-free, fuel-saving, *enduring* outfit of



"The morning after" in buying old-fashioned heating

AMERICAN RADIATORS & IDEAL BOILERS

IDEAL Boilers and AMERICAN Radiators diffuse the warmth so softly and genially that there is *uniform* comfort in halls, bathroom, nursery, bed-rooms, bays, and nooks, and all with less care-taking than with one stove.

IDEAL Boilers and AMERICAN Radiators give the utmost in heating comfort, with least up-keep cost. IDEAL Boilers are made in several patterns for getting all the heat from the fuel most abundant and lowest-priced in your own locality, be it hard or soft coal — screenings, slack or pea-coal; or lignite, wood, gas or oil.

All IDEAL Boilers are or may be fitted with an IDEAL Sylphon Regitherm, which automatically controls the draft- and check-dampers — giving you *little* to *liberal* amount of heat, to suit quick weather changes. Stops all fuel waste and saves "minding the fire," poking and the fussing that is the aggravation of old-fashioned heating devices.

A No 6-19-S IDEAL Boiler and 262 ft. of 38 in. AMERICAN Radiators, costing the owner $165, were used to heat this cottage. At this price the goods can be bought of any reputable, competent Fitter. This did not include cost of labor, pipe, valves, freight, etc., which vary according to climatic and other conditions.

No other feature of a building proves so conclusively that *the best bargain is quality*, because IDEAL Boilers and AMERICAN Radiators save heavily at the coal-bin, require no repairs, will outlast the building; and if you sell, you get back the full price paid. Need not be connected to water supply pipes — the same water is used for many years.

Give your heating money a chance to deliver real, care-free comfort and fuel economy in your farm or town home, store, school, church, etc. Prices *now* most *attractive!* Write to-day for book (free): "Ideal Heating."

AMERICAN Radiators and IDEAL Boilers change any house into a home.

Warehouses in all large cities

Greater Strength Each Year

Yes, greater power to resist the elements—ever-increasing strength that guards your farm structures against depreciation, keeps down repair bills—when you build with Lehigh Cement Concrete. That is why so many thousands of farmers specify

LEHIGH PORTLAND CEMENT

It's the exceptionally high strength of Lehigh that made it famous. This tensile strength increases with age, increasing the strength and resisting power of the concrete work. Concrete buildings made with Lehigh Cement defy deterioration.

You should read "The Modern Farmer"—our book about Lehigh Cement, and full instructions how to build concrete manure pits and other farm structures. It's free.

LEHIGH PORTLAND CEMENT CO.
111 Young Bldg., Allentown, Pa.
111 Consumers Bldg., Chicago, Ill.

Concrete Manure Pits are waterproof and preserve the strength of the manure and particularly the fertilizing liquids. The correct moisture can be maintained, preventing "bleaching" or "firing." Build one with "LEHIGH."

NEW YORK STATE APPLE OUTLOOK.

ABOUT 60 per cent of trees, have fair crop of good quality but a little under size. Local buyers are offering $1.50 for 2½ inch Greenings, $1.70 for Kings, packed A grade. L. V. F.
Charlotte, N. Y.

Apple buyers here are not taking hold. One local dealer has bought a few orchards at a lump sum, and another has paid $1.50 tree run, barrels included. Growers generally are going to handle the apples according to the new law.
Brockport, N. Y. H. L. B.

Our apple market is very dull. A few growers have sold Greenings at $1.50 per barrel "A" grade, packed 2½ inch. Others have sold Greenings at 50 cents per 100 pounds. Twenty Ounce are selling at $1.75. As yet there is no market for Baldwins. Most of the apples in this locality will be handled through a branch of the Eastern Fruit Exchange recently organized in Churchville and will be packed at central packing plant.
Churchville, N. Y. Y. D.

I have heard of one sale at $1.20 per barrel for New York standard grade A, 2½ inches and upwards, and this price has been offered us. The same buyers take the seconds at 20 cents per hundred. Evaporators are buying some orchards at 25 cents per hundred for the crop, shaken and picked up. Twenty Ounce and King A have sold for $1 per hundred. Fall Pippins and Maiden Blush 75 cents per hundred. G. W. C.
Union Hill, N. Y.

Buyers are only looking at orchards and some are not even offering any price. Local dealers are offering $1.25 for A grade for fruit and barrel and $1 for B grade. Growers who barrel their fruit will try to handle them according to the new law. Some are going to make three grades. Growers who do not spray or thin their orchards well have an inferior quality and nearly all of them are taken to the canning factory at a low price this year. We shall pack our fruit under the new law and store it in Philadelphia.
Sodus, N. Y. A. D.

I have heard of but one or two sales of Winter apples at $1.50 for A grade. Baldwin 2½ inch and up. Greening are bringing from $1.30 to $1.60 for A grade, 2½ inches. They sort ont one half or more. Twenty Ounce are from $1.75 to $2.25, A grades. There has been no market for drying stock yet. One carload of ciders sold at 12 cents per hundred.
Spencerport, N. Y. L. E. C.

I do not know of any sales or any offers being made by buyers. I think this is due to the reluctance of the banks to advance money on storage receipts, as they usually do. I believe that all growers who are in the habit of storing and shipping their own apples are striving to live up to the new law. Others denounce it and are trying to dispose of their crop by the bushel. F. W. C.
Pultneyville, N. Y.

Wealthy, Twenty Ounce and Alexander have brought about one cent per pound or $2 for A grade packed according to the new law. I know of no sales of Greening or King. No offers made on Winter fruit yet. The buyers say there is no market and the export trade is spoiled for the present. There has been a new growers' and shippers' exchange formed here in the last few days with 20 members. Winter fruit seldom looked better than at present, and a good crop of most varieties. G. J. A.
Hilton, N. Y.

Buyers are offering $1.50 for King, Spy, Twenty Ounce and Pound Sweets. I have heard of one sale of Baldwins at that price, all to be packed standard A grade. I think nearly all the growers in this locality intend to pack in accordance with the new law. I understand the evaporators intend not to run. D. D. S.
Wyoming, N. Y.

Some buyers are offering $1.50 for Winter apples, but not many sales. It is about impossible for buyers to get money to buy apples with, or for farmers to get money either, and the uncertainty makes a man think twice before he buys apples at $1.50, even if he can get the money. I do not believe, however, that the apple crop will barrel up nearly as big as reported. C. A.
Medina, N. Y.

There are no outside buyers in here and the local dealers are not on the road looking for apples. They are buying some. Prices ranging from $1 per barrel, including the barrel, to $1 per barrel for the fruit. Growers who are packing their own apples seem to be making an honest effort to comply with the law and all seem to agree that the law is a good one so far as its intent is concerned. There will be comparatively few "fancy" grade apples here as they are running small. Grades will be mostly A and B, A grade being packed down to 2½ inch. Evaporator men are buying orchards, tree run, for from 25 to 40 cents per 100 pounds with chops out. C. P. F.
Williamson, N. Y.

The situation here is hard. Practically no sales have been made at this time; no buyers here and all local men seem to be talking less than $1. About 50 per cent. of the growers are packing in accordance with the New York standard pack. The rest are selling tree run. The inspectors have been around among the buyers and ordered several to either re-pack or mark unclassified. About 40 per cent. of the fruit will go as Fancy or A brand, here. Reports have it that buyers from out of the State are shipping out fruit, unbranded and a very poor class of fruit at that. T. W. A.
Holley, N. Y.

Dealers do not seem to be buying in large quantities, whether from lack of financial backing or confidence, I do not know. One dealer with whom I have talked, says he is going to store about three thousand barrels—enough to take care of his regular trade—and will buy only in small lots through the Winter. This man ordinarily stores 20,000 or 30,000 barrels and buys small lots besides. Greenings, N. Y. standard A grade, min., size 2½ inches, are bringing $1.50 per barrel, packed. I have not been able to get an offer on a very nice lot of Kings and Baldwins and have not heard of any sales or bids. Wealthys and Twenty Ounce I received $2 for. Cold storage space is all taken and I know of several lots which are going into common storage. We are all packing under the new law and I believe it will help us in marketing this crop. L. M. B.
Albion, N. Y.

It is not my opinion that the buyers are making a concerted effort to work the price down. I believe the truth is that the buyers are entirely at sea as to what they are going to do with the apples after they buy them. This, we think, is borne out by the fact that very few buyers are in sight anywhere, and it seems to us that if the buyers were acting in concert to work the price down, they would be in evidence, talking low prices. The writer has been connected with a line of canning factories for the past ten seasons and has been interested in the buying of apples for canning purposes and has had to follow closely the barrelled apple situation. During that time I have never known the buyers to be avoiding apples as they are this year. The reason would seem plain that they have fear of their ability to dispose of the fruit on almost any basis. Most farmers who are marketing their own barreled apples are doing so in accordance with the new law. I find them more or less conversant with this law, but find also that many prefer to market their apples to the buyer tree-run and let the buyer assume all of the trouble in the marketing of the fruit under this law.
Batavia, N. Y. R. M. D.

Sept. 28. Fruit raising and dairying are the principal occupations in this, the Southern part of Ohio. People are beginning to turn their attention to fruit, as this section is more adapted to grazing and fruit raising than to raising grain. Price for butter at stores here 24; eggs 24; peaches $1 per bushel; apples not much sale, talking 50 cents per bushel. Potatoes $1; hogs 8½; cattle 6 to 7; chickens 10; veal calves 11. Wheat around the dollar mark, while flour sells by the single sack for from 70 to 75 cents. One mill offers 95 cents for wheat while flour from their mill is retailing at 70 cents per sack. The potato crop here is a failure, owing to drought, yet prices remain low.
Alice, O. E. L. T.

NEW YORK STATE NEWS.

THE REST DAY LAW.—The cheesemakers of the State are of the opinion that the one-day-of-rest law, enacted by the last Legislature, is unconstitutional, and they are going to try it out in a test case. Wm. J. Peach, one of the largest cheese manufacturers in the State, has been made defendant in a friendly suit to test the law. It is to get a decision of the courts on an important matter, as the cheese men think, for milk must be taken care of on Sunday as well as on any other day of the week at cheese factories.

THE DEER SEASON.—October 1 the deer season officially opens. It is well for those who shoot deer, or shoot at them even, to bear in mind that male deer only may be shot, and these must have horns at least three inches long. The fine for violation of the law in this respect is at least $50.

THE APPLE TRADE.—There is less activity in the apple business in Western New York than last year, but growers and buyers will be likely to get on better terms before the week closes. Farmers have been holding No. 1 Kings and Greenings at $1.50 and some were sold at that price but Baldwins went for $1 to $1.25. It appears that the foreign war is not hampering shipments as badly as it was feared early in the season. In fact the export movement from Atlantic ports to European ports was greater by 10,000 barrels, up to last week, than for the same time last year. Last week's movement from New York was 17,000 barrels, the shipments being divided between Liverpool and Glasgow, the latter getting the big end of the trade.

INDICTED FOR ROAD GRAFT.—A former first deputy State highway commissioner and a Troy contractor have been indicted by the Ulster County grand jury on charges of conspiracy and grand larceny, also a labor foreman. These indictments hinged on a comparatively small contract for building two and a half miles of road in Saugerties township, the allegation being that the stone used on this road cost only $3.30 a cubic yard, while the State paid $6.25 for it. It also appears that the road was a wretched piece of work, and one end had worn out before the other end was completed.

FOREIGNERS WANTED IN JEFFERSON.—A plan is under way in Jefferson County to organize an association for the purpose of inducing desirable immigrants to locate there. This is done in view of the shortage of farm help, both indoors and out, and it is believed that if a stream of immigration can be started from a race or nationality to this locality that it will continue for many years. Of course, no immigration is expected from the nations while at war, but when it ends there will be a rush for this country, as the promoters of the plan aver. Senator Brown, State Grange Master Vary, D. C. Douglas, and others, are interested in the matter. It is hoped that 500 or 1,000 farm laborers may be induced to settle in that county, and it is estimated that there are now enough vacant houses to accommodate them.

GRANGE HALL DEDICATED.—The fine new grange hall of Chapel Corners Grange, in Poughkeepsie, was dedicated recently, State Master W. H. Vary officiating. The building is of concrete blocks and cost $3,000. The assembly hall is on the second floor, and on the first floor there is a kitchen and smaller rooms.

COW JUDGING CONTESTS.—The Farm Bureau of Tompkins County has conducted cow judging contests at three county fairs, and thereby 44 boys have received a lesson in judging, while 31 were benefited by actually testing their skill in placing the cows, in the judging ring. It would seem to be a good plan for other farm bureaus to adopt where there is much interest in the breeding of pedigreed stock. J. W. D.

COMING FARMERS' MEETINGS.

National Apple Day, October 20.

National Dairy Show, Chicago, Ill., October 22-31. The following meetings and conventions will be held in connection with the show: American Association Creamery Butter Manufacturers, Oct. 26. Holstein-Friesian Association of America, Oct. 26. International Milk Dealers' Association, Oct. 26 and 27. Conference, Secretaries of State Dairymen's Association, Oct. 27. Official Dairy-Instructors' Association, Oct. 27. National Dairy Union, Oct. 28. American Dairy Farmers' Association, Oct. 28. Council of the National Dairy Show, Oct. 28. National Association of Creamery Managers and Owners, Oct. 28. American Jersey Cattle Club, Oct. 28. National Association of Ice Cream Manufacturers, Oct. 28, 29 and 30. International Association of Dairy and Milk Inspectors, Oct. 29. American Guernsey Cattle Club, Oct. 29. Congress of Marketing, Oct. 29. Milk Producers' Association, Oct. 30.

New England Fruit Show in connection with the Rhode Island Fruit Growers' Association annual meeting, in Providence, R. I., November 9, 10, 11 and 12; secretary, A. M. Parmelee, Norwood, R. I.

National Grange, annual meeting, Wilmington, Del., November 11-14.

Maryland Week Exhibition, State Horticultural Society, Maryland Crop Improvement, Dairymen's and Beekeepers' Association, Baltimore, November 16-21.

Annual Show of the Paterson, N. J., Poultry, Pigeon and Pet Stock Association, November 18-21.

Indiana Apple Show, Tomlinson Hall, Indianapolis, Ind., November 18-24.

Western Connecticut Poultry Association of Danbury, Conn., Inc., nineteenth annual exhibition, Hull's Armory Hall, Danbury, Nov. 26, 27, 28; secretary, Thomas Deans, 39 Hoyt St., Danbury, Conn.

Second annual seed exposition, Montana Seed Growers' Association, Bozeman, Mont., December 8-10.

January 9th to 15th, inclusive, 1915, Mid-Winter Exposition, State Fair Grounds, Columbus, Ohio, Corn, Apple, Dairy and Poultry Shows combined.

Black Wall Map of the World

The World and the United States At A Glance

A Great Education

At Your Fingers' Tips

This beautiful Wall Map, size 25x39 inches. On one side we have a complete, up-to-the-minute map of the United States in bright colors, showing the Capitols, Railroads, Rivers, large cities, etc. It also shows portraits of our 27 Presidents, and gives their biographies.

On the reverse side we have a map of the world, printed in a deep, ebony black. White and colored lines differentiate countries, rivers, lakes, cities and mountains. You never saw a map as black, as beautiful, as wonderfully enlightening as this map of the world. From this you may in a single day learn more than you could in a year's study of books.

Contrasting with the ebony black of the map are the flags and the coat-of-arms of all nations, in their flashy, exquisite colors. Our own seventeen flags are here in beautiful, bright colors—did you know that the United States had seventeen different flags?

And then, there's that wonderful Bible information. How many books, chapters, verses, words, letters does the Bible contain? How many books are classified as History, Poetry, Law, Prophecy, Epistles? Which books are exactly alike? How many times is the name of our Saviour mentioned? In how many languages is our Bible published?

Wouldn't you want to know these things? And wouldn't you want to know the many, many other things this marvelous Map of Knowledge possesses?

The Map will be sent, postpaid, for One New Yearly Subscription, or Twenty 10-Week Trial Subscriptions, or Two Yearly Renewal Subscriptions.

The Rural New-Yorker, 333 West 30th St., N. Y.

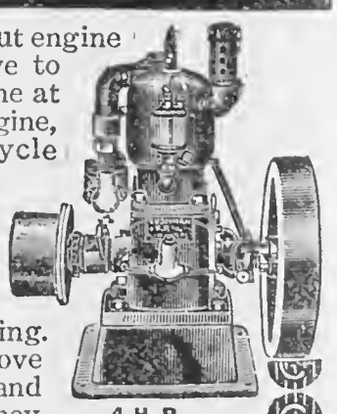
Built to Run Without Trouble

There is enough trouble on the farm without engine trouble. You don't want an engine you have to tinker with all the time. You can buy an engine at most any price, but when you get a cheap engine, your troubles have just begun. The 4-Cycle

Cushman Light Weight Engines

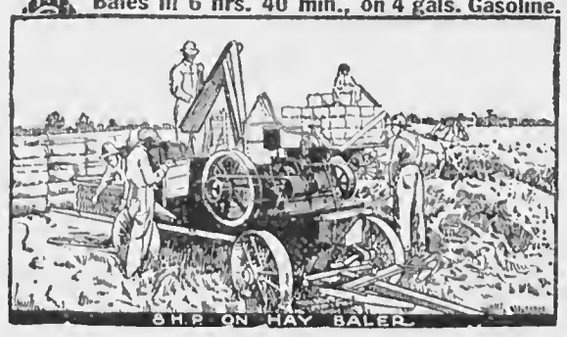
For All Farm Work—4 to 20 H. P.

Are built to run without trouble. Very quiet and steady, because of Throttle Governor and perfect balance. No jerky, wobbly, explosive hit and miss running. Economical of fuel. Very light weight and easy to move from job to job. Do everything heavier engines can do, and many things they can't do. 8 H. P. weighs only 320 lbs.



4 H. P.
Wt. 190 lbs.
Friction Clutch Pulley
Schebler Carburetor

8 H. P. Cushman Driving Hay Baler. Baled 500 Bales in 6 hrs. 40 min., on 4 gals. Gasoline.



Geo. C. Scott, Pawnee City, Neb., writes: "Your 4 H. P. takes the place of any 5 H. P. It is light and economical with a good range of speed."

A Young Clover Crop.

WHAT shall we do this Fall with a strong crop of clover of this year's seeding?

On the college farm we do not pasture our meadows. It is not every year that we get a sufficient growth of second-crop clover to raise the question whether it shall be taken off for feeding purposes or left on the ground for the benefit of the soil. As a rule, when we have the growth we usually have use for the hay and harvest it. I should say the need of the hay would be the factor that would decide what course to pursue.

If the farm supplies more than sufficient hay for the live stock kept, it is good practice to clip the second growth and let it remain on the soil. As an experiment, two years ago, having a field with a very nice second growth we cut and removed a portion of it, we clipped and left on the ground another portion, and left the third portion standing. This growth was so good some feared that if left standing it might fall flat and smother the roots. As a matter of fact, we were not able to discover any material difference in the effect upon the succeeding Timothy crop. Of course it must be that leaving the crop on the ground will, in the end, benefit succeeding crops, but the benefit did not appear immediately. My answer to such a question is, if you have real need of the hay, harvest it; if not, leave it on the land for the benefit of the soil. I know little difference between clipping it and allowing it to stand.

[PROF.] J. L. STONE.

Cornell University.

It is some years since we have had a growth of clover that seemed to need any especial attention the first season. Even this year of increased rainfall gives us only one piece that can possibly take any harm by being left to itself, and this is not so great a growth as to determine us to cut it. Usually there is no danger in leaving it to take care of itself, and if not we let it alone. I have tried clipping and leaving on the ground, but I think if I were to clip at all I would harvest and feed, returning something in the shape of fertilizer. Sometimes we used to turn in stock, but of late years all cattle have been kept out of the mowing land. This we do so as to prolong the time of keeping the field in grass. My idea would be to let it alone unless the danger of killing out is considerable, and if that is the case I would either turn in cattle for a short time or mow and feed to stock. H. H. L.

Plowing Old Grass Field.

I EXPECT to plow under a grass field that has not been plowed for 10 years. Would you advise a coat of lime before plowing this Fall? The ground is well drained and does not appear to be sour. I wanted to plant a part of the field this Fall with strawberries and perennials. Would this be all right, or would I better wait until Spring? W. E. K.

New Jersey.

We should not put lime on top of that sod and plow it all under. In this way you would lose part of the value of the lime. The best way is to plow the land, then spread the lime and work it thoroughly into the soil. In this way lime is mixed all through the upper soil, so that it may perform its chemical work to a much better advantage. It is probable that the land is sour after standing so long. Do not under any circumstances plant strawberry plants on an old sod of this kind or on soil which has just been limed. You could hardly do a worse thing than follow either plan. The strawberry will not thrive in connection with lime, as it prefers a sour or slightly acid soil. These old sods are sure to contain many white grubs and wireworms which would prove very dangerous to the berry plant. It would be well enough for the perennials, but leave out the strawberry until that ground has been thoroughly fitted.

Acetylene Waste as Whitewash.

SOME time ago, some one asked about a use for the waste from an acetylene plant. In the South, a development company used it as whitewash on fences and laborers' cottages. G. S. H.

R. N.-Y.—This waste or deposit is lime—nothing else, therefore it ought to make a fair whitewash.

"YES, my son is going to spend a few days in the city." "He'll git bunkoed sure." "Well, he's sure of carfare home. He's wearing a $10 bill underneath a porous plaster on his chest."—Louisville Courier-Journal.

SPECIAL BARGAINS THIS MONTH

Order Quick if You Want These Goods! Don't Wait!

Here are five of the best bargains you ever saw. If you can use any of these articles you will save nearly 50c on the $1 by rushing your order to us. Don't wait a single day, as we cannot secure any more of these goods. These are not mail order goods. They were made to sell through high-priced city dealers. But we can offer these small lots of high quality goods at much less than manufacturers' cost, because we bought them at a great sacrifice. These five manufacturers made too many goods for their regular dealers. They needed money. We offered them spot cash and got the goods at our own price. If the quantity had been larger we would have put them in our next catalog. But there are only a few of each article, so here they go—at just 4% over what they cost us.

Don't waste a minute or you will be too late to get them. Rush us your order direct from this ad. You take absolutely no risk. Look at the goods when they reach you. If they are not just as represented—send them back at our expense and we return your money the day we get the goods back. Nothing could be fairer. You do not buy until you see the goods. And you could not get the same goods anywhere for less than 50% more than we ask.

2500 Rolls of Rubber Roofing Guaranteed 5 Years, Per Roll 83c

Never before has this high-grade rubber roofing been sold through the mail.

To move it quickly, one of the largest manufacturers in the country turned it over to us.

This is strictly their first grade roofing, and only sold at our greatly reduced price to help them move quickly.

Our prices are positively the lowest ever known on strictly high-grade roofing.

It will go fast, so send in your order at once if you want to take advantage of this bargain.

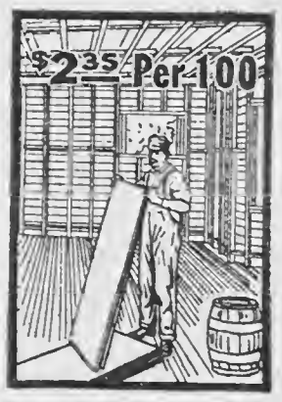
Guaranteed to resist heat, cold, acid or fire; easy to lay as a carpet; nails and cement free.

Buffalo Wall Board $22.50 Per Thousand

Why use lath and plaster when you can buy Improved Buffalo Wall Board?

Think of it! This board is the only one sold that can be *papered over* with good results.

Wall board is no longer an experiment, but is twice as cheap as lath and plaster and four times as easy to put on: no waiting for plaster to dry, no experience needed to apply. Any man with a hammer can do the job.



Never checks or chips like plaster, is fire retarding, rat and mouse proof. Warmer in the winter and cooler in the summer.

Can be had oak grained at a slight advance. Send for sample today. Our estimating engineers will figure up your house and show you how to save money.

Buffalo Ready Mixed Paint $1.06

We are offering 1500 gallons of the best ready mixed house paint on the market.

Just think, a high-grade paint at $1.06 per gallon in five gallon cans, one gallon cans $1.18 per gallon. A No. 1 oil barn paint at 78c per gallon in three and five gallon cans.

Buffalo Ready Mixed Paint is not the usual cheap ready mixed paint you have been buying. Instead, it is guaranteed to cover more surface per gallon than any other. Wears like iron; does not peel or flake; preserves the buildings, and makes them more attractive. Send for our Big Color Card.

Buffalo Crimped Fencing

If you want a fence that will hold up under all conditions, don't buy before you get our big fencing sheet.

We have several thousand rods of the best grade of fencing that is made. Heavy pure steel wire, triple galvanized. Patent lock joint that cannot slip and will not rust like twisted or welded joints. This fencing would cost you more money direct from the manufacturer than we ask for it.

Get your order in quick, before our stock is sold out.

Every piece of wire in these fences goes through a patented process which leaves a perfectly smooth surface for our heavy galvanizing.

Our big fencing sheet will tell you the best fence to use and give you a price per rod laid down at your railroad station. Our list of heavy all No. 9 fences will last a lifetime if stretched properly.

26 in. Hog Fence 14c Per Rod.
48 in. Field Fence 20c Per Rod.
Send for Special Fence Sheet.

Let Us Be Your Heating Engineers Free

This is exactly what we mean. We have an experienced staff of heating engineers who do nothing but help our customers install hot water and steam heating.

Our hot water and steam boilers are the surplus of several large manufacturers, and the name Electric City means satisfaction.

These boilers are second to none as fuel savers, and every boiler is guaranteed to give perfect satisfaction.

Send us the plan of your house and we will tell you how much it will cost you to heat your home, including boiler, radiation, pipe, and fittings.

This service is absolutely free.

Write today and enclose your plan.

Get Our Big Free Book

Send for our book containing over 5,000 bargains. Not a single inferior or second-hand article in all our acres and acres of quality merchandise. Every article listed was made to sell to the highest quality trade. We buy only the over-production of well-known manufacturers, who refuse to sell to mail order houses regularly. And we buy these goods cheaper than a mail order house can buy goods of much inferior quality, because we buy only *when the manufacturer has to have the ready cash*. We help over 500 big manufacturers to turn their extra goods into quick money every year. And you get these high quality goods at far below the price your dealer would have to pay the manufacturer for the same goods.

Mail This COUPON NOW!

This Brings 5,000 Bargains!

The Manufacturers' Outlet Co.
Dept. 313, Buffalo, N. Y.

Send me your new Book of 5,000 Bargains and keep me posted from time to time as you get more goods at Bargain Prices.

Name _____

Town _____

R. F. D. *State* _____

(51)

Our Guarantee

Every article we sell is guaranteed to be exactly as represented. All sales are made with the distinct understanding that you are to return the goods to us at our expense and get your money back, if you are not satisfied upon examination at your freight station. We will not have a single dissatisfied customer if we can avoid it. We take all the risk. As to our responsibility, we refer you to any bank or commercial agency.

No Discount to Merchants

We cannot sell the goods listed in our special bargains to merchants. Where we have a sufficiently large quantity to list goods in our catalog, we will sell to merchants at our printed prices only. These prices will permit you to sell at retail at a handsome profit. Terms are spot cash with order, as we cannot do business at these prices on credit terms.

Manufacturers' Outlet Co., Dept. 313 Buffalo, N. Y.

Hope Farm Notes

WILL you advise me regarding the Fall planting of peaches and other fruit trees? F. R. A.
Allendale, N. J.

As the result of our experience we plant in the Spring. One year we planted both apple and peach in the Fall and had a fine showing as the result of it. Encouraged by this we made heavy plantings the next Fall and lost about 75 per cent. of the trees. Investigation showed that the first lot of trees were fully matured, with the wood solid and firm. The Winter, while cold, was steady, without great changes. In the second case the trees were soft and tender. The nurseryman had evidently stripped off the leaves by hand to make them appear dormant. The Winter was variable—severe cold spells alternating with warm thaws in February. Those unripe trees were frozen and did not recover. With trees fully mature and sound I think Fall planting in our section would be safe. The work would be out of the way, and in case of a very late Spring this would help. After our experience, however, we stand by Spring planting.

Why was it that my strawberry bed, 15x30 feet in dimensions, yielded me less than half a dozen quarts of berries this season? J. B. L.
Vermont.

Not having seen the strawberry bed I do not know. All I can do is to name some of the things which might be responsible. The plants may be "imperfect." Most varieties carry both male and female flower parts and are thus self-fertile. Others have only the female parts, and cannot set or produce good berries unless the pollen is supplied from other plants. Bees will do this to some extent, but usually such varieties give little or no fruit unless male plants are nearby. There may be white grubs working at the roots, or borers at the fruit buds. The plants may have been fed too much nitrogen last year. In that case they would make a rank, heavy growth of vine and leaf, but very few fruit buds. Remember that the buds from which next year's crop will grow are *now made* or now *being made*. If you force the plants into a rank growth now you may have no fruit next year! The soil may not suit the berries—you may have used lime or wood ashes freely, in which case the strawberry plants will not do their best. How old are these plants? If they are potted plants set last Fall you could hardly expect a larger crop. As you give us no particulars I cannot do more than mention these general causes.

FARM NOTES.—Our mangel crop will not be a "wonder" by any means. There are no great roots such as we read about, but we shall evidently have a good lot of medium-sized mangels. As we expect to sell part of the crop to chicken men these smaller roots will be more suitable than the giants. The carrots have done better this year than the mangels. In fact the carrot seems to me better able to take care of itself than any farm crop I know of.....There are still several varieties of late peaches to pick—Salway and Iron Mountain and several of the elings are slow to mature this year. A light frost will not hurt these tough citizens. On the whole, in spite of rather low prices, our peach season has been the best we ever had. Some of the large growers have been obliged to sacrifice some of their crop, but we have so many varieties that there has been no great surplus of any one. From Alexander to Salway and Iron Mountain with us means 75 days at least of continuous peach picking..... By October 1 all the Wealthy, Twenty Ounce and Wolf River apples had been sold. The McIntosh had been picked and all delivered except about 50 packages. Then will come Greening and Northern Spy—the latter a Fall apple with us. Most of these earlier apples sold in peach baskets at 40 cents each for No. 1. The Baldwins will be left on the trees as long as we think safe and then picked and sold at once. I shall make no effort to store fruit this year—except enough for our own use.....Corn cutting started September 23, and we hope to get the entire crop cut before frost. Our corn is all grown in the orchards between the rows of trees. Many of the trees are now so vigorous and large that the corn does not have a fair chance, and thus makes a poor crop. In the younger orchards our flint corn does well, and is the best variety or strain I have yet found for such planting. The stalks are slender and full of leaf, so that the stock will eat the fodder up clean—as they do hay. The ears are full of kernels, and well set on the stalk. I feel sure that selected strains of Canada flint corn will produce more grain in orchards or on rough hillside culture than any other grain plant that can be found. Last year we lost much of our seed through the wet Fall, but this year we shall make a business of saving it.

CLASSIC COVER CROPS.—We surely have all sorts of people who are interested in farming, and they look at the subject from many different angles. Take this cover crop proposition. Not many of us can see any classic literature or poetry in plowing rye or turnips or vetch into the ground. It seems a very practical operation—though we know it is profitable. Men come and tell me to read in old Greek and Latin classics about this very process. They also tell me that the poets have plowed a few cover crops into literature. These classics are beyond me. I can root-prune a tree, but Greek and Latin roots are too much for me. As for the poets no doubt many of you are already familiar with the following from "In Memoriam."

How many a father have I seen,
A sober man among his boys
Whose youth was full of foolish noise,
Who wears his manhood hale and green.

And dare we to this fancy give,
That had the wild oat not been sown
The soil, left barren, had not grown,
The grain by which a man may live?

You might, with much truth, call that a moral cover crop—plowing under a crop of young wild oats and putting on a good dressing of character to represent the lime. Some minister, familiar with farming, might make a good sermon out of this. You will have to count me out of sermons and classics, but if I could have my way this matter of cover crops would be driven home to farmers everywhere and at all times. Having seen what rye and lime have done for our hard and barren soil, I try to spread the glad tidings—especially to those farmers who are situated so that they can grow vetch, clover, beans and the other crops which are so much better than rye.

HOPE FARM HENS.—There has been some objection to "scrubs" as a name for the hens at the egg-laying contest. It is suggested that "culls" would be a better name. I do not care what they are called—suppose we call them "hens." That ought to suit all hands. Whatever you see fit to call them here is their August record:

HOPE FARM "HENS."

	May	June	July	August
No. 1.....	21	7	18	13
No. 2.....	22	19	21	20
No. 3.....	23	22	20	17
No. 4.....	21	10	18	8
No. 5.....	28	21	12	16
No. 6.....	25	19	15	10
No. 7.....	13	11	4	15
No. 8.....	19	18	10	26
No. 9.....	22	23	25	26
No. 10.....	19	19	22	21

As they laid four eggs outside the nest they are credited with 170 eggs. Suppose we make some comparisons, as follows:

EGGS IN AUGUST.

Hope Farm "hens".....	170
Best Rock (3 breeds).....	177
Poorest Rock (3 breeds).....	136
Average Rock, 13 pens.....	153
Best Wyandotte (3 breeds).....	187
Poorest Wyandotte (3 breeds).....	122
Average Wyandotte (10 pens).....	154
Best R. I. Red	190
Poorest R. I. Red.....	102
Average R. I. Red (15 pens).....	132
Best Leghorn	238
Poorest Leghorn	104
Average of all (82 pens).....	159

Thus my "hens" beat the average of all the pure breeds and the average of all by 11 eggs. Up to September 1 they laid 1,158 eggs. I had figured on 1,100. Judging from their past week's record I think they are now about done, and I expect to see them quit entirely by the middle of October. If they lay 1,300 eggs all told by November 1, it will be at least 300 more than I expected, and I am prepared to enter them right over again for another trial.

CHRISTMAS TREES.—I have told several times what a mistake we made when we first came to this farm and started to clear up the back fields. We started to raise corn and potatoes, and then peaches and apples. The latter are doing well, but the journey over the rough hills is bad for the peaches. I now see that if, when we started, we had planted from year to year, hemlock and spruce in these fields and given them reasonable care we should now be reaping our reward. The demand for Christmas trees is growing each year, while the supply for New York has been restricted. Had we started planting the evergreens when we came here we might this year cut out carload lots of trees suitable for Christmas, and in this way benefit the trees that were left. Somehow I must confess that I could not take "forestry" very seriously when we started. By the failure to look ahead we have missed an opportunity. No doubt the dairyman or the grain grower or stockman will smile at this idea of a Christmas tree crop, but there is a good future in it for some young fellows near large cities who have cheap waste land and abundant patience. This country is now so big and its people are so varied that any product you can mention may become a profitable crop if the right man will start it in a suitable place. If you could look ahead 10 or 15 years into the future development of your neighborhood and market the chances are that you would go to planning to produce things which seem ridiculous to you now. H. W. C.

The Florida Land Frauds.

YOU recently printed part of our circular showing up the land frauds and fakers. While you evidently bear the distinction clearly in mind, I want to invite your attention long enough to say that readers of my letters should notice that I am aiming only at the fakers; I mean the fly-by-night organizations or agents that acquire swamp lands or beds of sand in Florida and sell them out to unsuspecting victims. These barren tracts are to be found in New York and, indeed, in every State in the Union, and constitute but a small part of the acreage. These fakers do not go into the best counties, or even secure titles to or control of fairly good land, not to mention the best land. These are the fellows we want to nail, and thus save men and women from all over the country from being victimized. Whenever you hear of one of these fellows in this territory, if you will send us down a description of the exact location of their lands, we will have the matter looked into, and can tell you mighty quick if the soil is fertile and adapted to the peculiar crops that may be boosted.

Only the other day we very likely saved a man from investing in some pineapple land or land for pineapples. The tract was represented to him as being first-class for the growing of that fruit, when as a matter of fact, it was not, being within the frost belt, but is of high grade as farming or grazing land.

F. M. RUNNELS,
Secretary.
Gainesville, Fla., Board of Trade.

THE real estate dealer had gone into the details of the Summer cottage at great length and Mr. Steiner had become bored. "The cottage is a stone's throw from the trolley," said the agent. "Indeed! That's good," said Steiner. "It will give us something to do Summer evenings." "I beg your pardon," said the agent, rather mystified. "I said it would give us something to do evenings," repeated Steiner. "We can sit in the cottage and throw stones at the trolley."—Evening Post.

Write For This Book

—if you haven't an indoor closet in your home. It tells how we have perfected a chemical system which does away with the necessity for sewerage or cesspool connections, thus placing a sanitary indoor closet within the means of those who could not heretofore afford one.

THE WATERBURY SANITARY CLOSET
ALL METAL-CHEMICAL

—can be placed in any room in the house, —it is so inoffensive, so absolutely odorless, so positively sanitary. The price of $22.50 includes everything. No installation expense. A boy can set it up.

We sell it by mail under a *real* guaranty covering the odorless and sanitary features, as well as materials and workmanship. Thousands sold and giving entire satisfaction.

If you're in a hurry to put an end to the inconvenience, discomfort, distress and suffering that you now have to put up with, send us your order direct. We'll ship promptly.

CHINESE PEACHES.

BULLETIN NO. 97, of the Office of Foreign Seed and Plant Introduction describes some of the new peaches introduced from China by Mr. Meyer. The Fei peach, from Feitcheng, is thus described:

A remarkable variety of clingstone peach, considered to be the best in all China. Size, large to very large; shape, round; very heavy, often over one pound apiece; skin, quite downy and of pale yellowish color, with a slight blush on one side. Flesh very juicy and sweet and of excellent aromatic flavor, of white color, except near the stone, where it is reddish. Stone very large and pointed, flesh strongly adhering to it. Ripens in early to middle October, and possesses excellent shipping and keeping qualities. The trees are of erect growth when young, but when older they spread out considerably, remaining of open growth. To reach their greatest perfection these peaches need to be fertilized each Spring, while during dry seasons they are irrigated from wells. The fruit is also thinned. The soil they seem to thrive in best is a porous, light clayey loam of reddish color, retaining moisture quite well, but not becoming too soggy. The local people calculate that on an average a tree supplies ten dollars Mexican worth of fruit each season, and they consider an orchard of these peaches a very valuable asset indeed. The climate around Feitcheng is of a semi-arid nature and this variety of peach may be expected to thrive especially well in the regions west of the Rocky Mountains. Chinese name, "Fei tao," meaning "Fei peach."

Five varieties of peach cuttings have been secured from Taianfu, Shantung. One of these is said to be very large and juicy, weighing up to a pound, and keeping to December, another of medium size, ripening late, and keeping well, a third very ornamental flowering variety, with small, peculiarly-shaped three-pointed, rosy-red fruits, and two of the pien tao or flat varieties, of good quality.

NORTHERN OHIO GARDEN NOTES.

IT is now a little past the middle of September, and I am using odd bits of time in transplanting strawberry plants from the edges of matted rows into the middles of late tomato rows which were planted between every other row of Alaska peas, and consequently are five feet apart. Next Spring I can plant early peas or beans where the tomatoes are, and can thus utilize the ground while the strawberries are making wide matted rows of plants to sell or transplant. The weather, barring rain, is much like April, with nights almost as long as days; the sun is no longer vertical, and with moist ground the conditions are very favorable to success. Many of the plants have some soil adhering to the roots, and being dug close by are out of ground less than half an hour. The ground is firm, it having been six weeks since last cultivated, and I do not disturb it. I just scrape it with a hoe to kill the young sorrel and purslane, and place the plants in small holes about as big as a teacup scooped in the soil, and press the loosened earth back around the roots. No attention is paid to straightening the roots, as it is not necessary, and too much fussing with the roots loosens the earth adhering and does more harm than good. At this writing, 11 a. m., very few plants set yesterday are wilting, although the sky is clear and some wind is blowing. My object in setting now is to save time and utilize plants which otherwise would have to be destroyed in plowing.

Possibly I may get a little fruit. When the frost kills the tomato plants I shall pull the vines and throw them over the berry rows, which will protect them sufficiently until time for Winter mulching in December. Where there is a plantation close by the transplanting may be done as late as October 10th in the latitude of New York, and later farther south, provided the ground is kept from freezing by a mulch of short straw or coarse manure. A healthy strawberry plant set in moist ground with little disturbance or drying of the roots will often send out roots six inches long in a week after moving, but these roots are near the surface, and too weak in their growth to hold against frost.

LATE CUCUMBERS.—The latest cucumbers I ever grew were planted in the row between newly-set raspberries, the raspberries being 72 by 30 inches. The raspberries made a rank growth, and at blighting time (close of August) shaded the vines and I am sure prevented the blight spores from being deposited in large measure by the wind, and the cooler atmosphere hindered development of those which were deposited. The vines were healthy and bore until frost came in October. Gathering the pickles was thorny work, but I had the market all to myself and those dilatory women who always wait to buy cheap had the pleasure of paying 60 cents per hundred or doing without. As the frosted leaves dropped I found quite a few overgrown slicers which had been overlooked, and these found a ready sale for chopping. I have a friend who plows under a rich strawberry field nearly every year and plants to sweet corn and cucumbers about June 25th. He marks for corn and plants two rows of corn and one of cucumbers. The ground is marked east and west and the cucumbers allowed to grow with two plants each two feet. The corn makes a rapid growth in the July weather, and seems to temper the atmosphere so as to prevent blight, and very likely catches spores which would otherwise be deposited upon the vines. For a couple of seasons this man has let his September setting grow to slicer size, picked them, and laid in loose piles upon the ground and covered with cornstalks. In this way they keep perfectly for three weeks, and last year he got one dollar per dozen, the market being bare of cucumbers. Of course, it must be guessing on the weather when to begin laying them by, but if they commence to rot they can be marketed and in any but abnormal seasons find a ready market. L. B. PIERCE.

The Brashington Cherry.

DO you know anything about the Brashington cherry, a sour variety? What are its good and bad qualities and why is it not catalogued by the nurserymen. J. F. S.

Waynesburg, O.

The Brashington cherry is a variety that I never heard of and I think it must be either very newly originated or of so little value that it has not been brought to general notice. There are such good kinds of sour cherries now well tested and known to be valuable that it seems rather needless to introduce new kinds, unless they surpass those we have in good qualities. The Richmond is the first to ripen, the Montmorency next, and the English Morello last, which cover the season fully and are almost without fault.

H. E. VAN DEMAN.

"No purpose once undertaken should be given up," said the resolute man. "Maybe you're right," replied Farmer Corntossel. "But I know a hen that lost a lot o' chickens by tryin' to hold out an' hatch a china egg."—Washington Star.

Six-40
HUDSON
$1,550

$3,875,000
Paid Last Month
For Hudsons

That is what users paid dealers last month for this new-model HUDSON Six-40: that is, they paid weekly, on the average, $930,000. They bought the limit of our output—100 cars per day—and urged us to build cars faster.

The World's Record
Among Class Cars

That is the record demand for a quality car.

The HUDSON Six-40 now outsells any car in the world with a price above $1,200.

HUDSON sales today are *five times* larger than last year at this time. Yet the HUDSON has long been a leading car. Such an increase as that—five-fold in one year—was never before made on a well-known car.

We trebled our output in July, when this 1915 model came out. But in 30 days we had 4,000 unfilled orders. Thousands of men—with other cars plentiful—waited weeks for this HUDSON Six-40. No other car would do.

The Magic Model

You should see at once the new car which has wrought this magic. It has upset all the old ideals, and changed all former standards.

It is 1,000 pounds lighter than former cars of this size, yet never was a car more sturdy. A new-type motor saves about 30 per cent on fuel.

It brings out countless new attractions in beauty, comfort and convenience. And it costs you less than a class car ever before has cost.

The cars you know will seem crude in comparison. Go see the refinements which men so welcome in this new-day type of car.

Due to Howard E. Coffin

This new-model car is due to Howard E. Coffin, the famous HUDSON designer. He has always led in advances. In this HUDSON Six-40 he reaches his climax—his finished ideal of a car.

He has worked for four years to perfect it. All the 47 other HUDSON engineers have worked with him. Now every part and detail show their final touch. You will never want a finer, lighter, handsomer car than this.

Go see it. If it suits you, get your new car now. The 1915 models are out now, so you know what's coming. And this is touring time. You have leisure now, and the coming months are perfect. Don't miss them. Your dealer will get you prompt delivery, even if the car has to come by express. To make prompt deliveries we have already shipped almost 1,000 cars by express—an unprecedented thing.

Hudson dealers are everywhere.
Name of nearest on request.

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York
HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.01, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates, 75 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. We use every possible precaution and admit the advertising of reliable houses only. But to make doubly sure, we will make good any loss to paid subscribers sustained by trusting any deliberate swindler, irresponsible advertisers or misleading advertisements in our columns, and any such swindler will be publicly exposed. We are also often called upon to adjust differences or mistakes between our subscribers and honest, responsible houses, whether advertisers or not. We willingly use our good offices to this end, but such cases should not be confused with dishonest transactions. We protect subscribers against rogues, but we will not be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and to identify it, you should mention THE RURAL NEW-YORKER when writing the advertiser.

NEXT WEEK we shall begin the publication of a series of articles on "Farm Stock Breeding." They will run for a number of weeks, and will, we think, prove thoroughly useful to all our people who are interested in the breeding of farm animals. Much of the excellent work done by the scientific men along this line has never been popularized and brought down to the clear understanding of the majority of the stockmen. The articles which we shall print are standard and give in clear, forcible manner the principles of the science of breeding and practical application for the farmer. Readers who are interested in live stock should plan to keep these articles on file.

*

JERSEY CITY seems to be the first community to try THE R. N.-Y.'s suggestion of using an auto-truck to collect produce for the public market. City Commissioner George F. Brensinger has been very active in trying to make this market successful. He went out himself with a big truck and collected a load; then helped sell it at retail. It will pay to organize a regular trucking service of this sort in order to supply these new markets. Tons of produce will be wasted unless some arrangement of this sort can be made for transporting it. Every farmer within hauling distance of New York raises more than he can carry. Bring that surplus in and all will benefit.

*

THE apple situation in New York State this year is peculiar. The crop is only a little above that of last year, yet from almost all sections of the State we hear that buyers are scarce. Two reasons are given for this, the uncertainty as to the export trade, and the tightness of money, as banks are less ready than usual to make advances on storage certificates. The home market will be looked after much more closely than usual, by advertising in local papers, canvass of the grocery trade, etc., and the *net* returns from such sales will frequently be found better than where the fruit is shipped or sold to travelling buyers. In several cases reported to us farmers have organized, bunched their crops, packed under the New York law and advertised in the trade papers. If this is kept up the present trouble will develop into a future blessing.

*

WE learn new things about our old friend, Luther Burbank from an interview in the Worcester (Mass.) *Post*. Mr. Burbank was visiting his cousin, W. D. Ross.

"Say, Cousin Luther," said Mr. Ross to a quiet, common-looking man in rather ill-fitting hand-me-downs—a man whom you would never take for one of the world's greatest scientists—"say, if we'd had you here for the fair and advertised that you'd talk just 10 minutes about your work, it would have meant about $10,000 to us."

Quite likely Mr. Ross is the author of some of those eloquent appeals for $151 sent out by the Luther Burbank Society. Mr. Burbank quietly disposed of the statement by saying: "I'm not much on talking." The reporter adds that Burbank's pictures make him look like an orator, "but they do him great wrong." Like all the rest of us, Mr. Burbank is interested in the European war. The *Post* reports him as follows:

Germany will have to depend more on the potato than ever before in this war—and it will be the Burbank potato.

Russia can raise in Siberia enough wheat to feed all the armies of the world. I am experimenting on a wheat which will help her do it.

My spineless cactus, used as a fodder, could feed the cavalries of every European army.

Germany is a wonderful nation, and we are bound to have great respect for Mr. Burbank's opinion, but we doubt if she will thunder very loud at the gates of Paris with men fed on potatoes and horses fed on spineless cactus. Mr. Burbank believes that in 20 years Siberia, with proper development, will be able to produce wheat for the entire world. He says he has a new wheat with heads three times as large as ordinary varieties. We think Mr. Burbank is right in thinking that the present war is to shake up the nations like chemicals in a bottle. The social explosion resulting from this will blow down old customs and ideas which many of us have considered fixed for centuries to come. The world is to find in Russia a wonderful producer and exporter of food.

*

WHAT Prof. Massey says on page 1209 about plowing under rye is further proof that no general rule can be given for farm operations. The farmer must think out his own plan. No doubt Prof. Massey is referring to the light open soils of the Delaware peninsula, where disking young rye would probably be the best policy. On most of our own farm and on most of the soil in our section it would be impossible to use the disk effectively on knee-high rye. The soil is hard and wet, and the seasons are backward. One reason for sowing rye on our own lower ground is to let this crop dry out the soil in Spring. Even if the disk would work on this wet soil it would leave it in bad shape for fitting. We are convinced that it pays us better to let the rye grow larger, then plow it under, pack down and use lime. The soil is very deficient in humus and we need all we can get. At least this system has paid us well and we conclude it is best fitted to our conditions. The danger comes in letting the rye grow too large in a dry season and in not packing it down hard. The rye is such a strong feeder and drinker that it will dry out a soil if left too long. If you leave the green mass loose in the soil you will have more trouble. By plowing under in time, packing down hard and using lime annually we have been able to start the rye into quick decay. On most of our Eastern farms and particularly where little live stock is kept, this cover crop matter is very important. There ought to be the fullest discussion of it because great judgment is required to handle it right.

*

THERE is one probable outcome of the European War which food producers should consider That is the discovery of new chemical methods of preparing food. As we know, the shortage of food during the siege of Paris, more than 40 years ago, led to the "invention" of oleomargarine. Chemists learned how to blend cheap fats into an imitation of pure butter. We all know what a remarkable effect this discovery has had upon the dairy business. It is not at all unlikely that the necessities of the present war may drive the chemists to new discoveries which will enable them to produce substances capable of sustaining life without going through the slow processes of animal or vegetable growth. The Germans are a strong, capable and determined people. We hear it said that this nation may be "starved out," yet it has been nearly self-sustaining in its food production, and its chemists are probably most capable of making the laboratory substitute for the farm in producing food and fibre. While America must now be considered the great food-producing nation for the next 20 years, we must all be prepared for new chemical foods which may affect our business as oleo has changed dairying, and the same necessities will drive our chemists to the discovery of new methods of producing the chemicals needed in manufacturing. Already it is said that Mr. Edison has discovered a new plan of preparing carbolic acid. We think both farming and manufacturing will be greatly changed by this war

*

WHILE we are discussing the trouble about buying potash this year let us remember that large quantities of this element are wasted on most farms. Now or never should be the time to save it. Ashes from wood, tan bark or similar fuel, contain potash. Save every pound of it under cover. Coal ashes have very little value as plant food, but may help a sandy or a heavy clay soil. The liquid manures carry most of the potash in animal excrements. Except in the case of pigs, the liquids contain five or more times as much potash as the solids. With cattle 85 per cent. of the potash is found in the liquids. For every 1,000 pounds of cattle there will pass each year in the liquids about as much potash as we buy in 225 pounds of muriate. This year therefore we have a stronger argument than ever before for concrete floors, full bedding and anything that will save the liquids. Remember, too, that in our grains most of the potash is found in the straw and stalk rather than in the seeds. All straw and cornstalks should be used as bedding or in the manure pile. We hear of the great sums of money which have been spent for commercial potash. It has mostly been well spent, but the sum could be multiplied by 10 and then fall short of the sum we have thrown away through a failure to save the liquid manures. You may have a chance to buy tobacco stems, ashes, tan bark or straw. These are the things most likely to contain potash. Such substances as fish, bone, tankage or meat have practically no potash, but do supply nitrogen and phosphoric acid. But in any event save the wood ashes and the liquids.

*

ON page 1086 we told how the Gainesville Board of Trade has gone out after the land sharks and "home seeker" rascals who have so long cursed Florida like a horde of human malarial mosquitoes. These Gainesville people are doing fine work. We try to lash the frauds, and we are glad to help the fraud killers. Mr. Runnels, the secretary of the Board of Trade, says he has received letters all the way from Massachusetts to Washington.

In some instances they have proved my contention that these people are laboring under mistaken notions. For instance, one middle-aged woman residing in the New England States, with only a limited amount of money, writes me that she was on the eve of purchasing 1¼ acre of ground on which she is to build a house and grow fruit and vegetables sufficient to maintain her. Now, what do you think of that? An inexperienced woman taking wild land and expecting, without previous experience, to make a comfortable living, paying for this land at the rate of $100 per acre!

What do we think of that? Nothing new. We have known of such things for years. We rejoice to think that Florida people are at last waking up to realize what this rascality means to the State. They are not all awake yet. It seems that Mr. Runnels has been criticized by another "Board of Trade" for telling the truth about these frauds. We like the way he comes back:

As long as I am in Florida, whenever an opportunity comes up to establish the good name of our State, I am going to land on these fellows every time I get the chance. They have done more to injure Florida, they have robbed more thousands of people using Florida as their jimmy, and have caused more people to curse the State than all the legitimate advertising and legitimate salesmen has been able to overcome.

We have heard people offer a good argument to show that Esau was justified in selling his birthright for a mess of pottage, but nothing can justify the people of Florida or any other section, for giving the land sharks and "home" baiters a white card to rob the confiding poor.

BREVITIES.

CALIFORNIA farmers have combined to fight the eight-hour law.

GET the stoves or heaters going early enough this year. It may save a cold that will last all Winter.

A LOT of these big stories which we are to take with a grain of salt seem to be salted down so that they keep forever.

WE believe that more grape juice will be preserved by private families this year than ever before. A good thing, too.

I CAN put a dollar bill on the wall within 10 feet of you. Then I can put a copper cent in front of your eye so that you cannot possibly see the dollar!!

"ALL the eggs in one basket." The old advice about this is good, but the trouble is that most farmers will not have any eggs at all—basket or no basket—until next Spring.

NOW comes the old question about the superiority of nursery trees grown in one section over that grown in another. It makes little difference to us provided the trees are vigorous and the wood well ripened.

NO question about the growing demand for nuts. This is a product well suited to a parcel post trade and for advertising. Anyone with good nuts for sale ought to let the public know where he lives.

THE Indiana Experiment Station has worked out a new method of killing wild onions—that pest of the pasture. It means spraying with road oil and is best done in the Spring. We shall tell all about it in time for use.

IN reply to many questions we consider good corn fodder—dry and sweet—worth about half as much as hay. Silage is worth about 30 per cent. of hay prices, and green corn, standing in the field, about $1.50 per ton.

THE very first principle in using hen manure as a fertilizer is to crush and sift it as fine as possible. All fertilizers should be spread evenly and freely to obtain best results. A "chunk" is nowhere near as effective as a handful of dust.

SOME of the farm writers advise burning all squash and melon vines. This is to destroy borers and other insects or diseases. Anyone with an apple orchard should hesitate to burn up any organic matter. We haul the potato or squash vines and pile them around trees where these crops are never grown.

MANY poultrymen use mercurial ointment for destroying vermin on poultry. It makes a very good lice killer. The war has about doubled the price, as most of this material is produced in Germany. If the war conditions continue the material may be practically out of the market, or out of the reach of practical people.

THE Nebraska Experiment Station advises the adding of water to the corn while it is yet on the wagon, rather than pumping water into the silage. The water and silage must be thoroughly mixed to prevent it from molding. It is the opinion of the station that it does very little good to put water on silage after it has been filled. Dry, semi-dry or frosted corn should always be dampened as it enters the silo. Ordinarily it requires from one to three tons of water for each ton of such corn. It is always better to get too much rather than not enough.

THE LAND BANK.

SOME of the politicians who would like to be Governor of New York, and some political papers which favor their ambitions, seem to think that it is necessary to oppose and discredit the Land Bank system, now being organized to finance farm and home mortgages in the State, because Governor Glynn was instrumental in securing the passage of the Land Bank law, and has encouraged the organization of it. Mr. John A. Hennessy, an aspirant for the nomination for Governor, and the *Knickerbocker Press*, of Albany, have been particularly hysterical in their attacks. Mr. Hennessy tells farmers that saving and loan associations cannot loan money on farm mortgages. He accuses everyone who disagrees with him as ignorant of the law. We can tell him that these institutions have had the authority to loan money on farm mortgages for more than 20 years, and have done so in a limited way. The Land Bank is intended to enable them to finance every farm and home mortgage in the State. Mr. Hennessy says instead of saving money for the farmer the Land Bank would rob him, and challenges anyone to meet him on the platform and discuss it before an audience. That challenge is here and now accepted. We are not candidates for office. We are not campaigners or orators. Mr. Hennessy seems to be all three. But we have confidence enough in the horse sense of the American people to believe that they are not going to be fooled with oratory and buncombe, and that they can grasp the principles of a business proposition and pass intelligently on its merits when it is presented to them in plain, unvarnished English. We had something to do with the preparation and passage of the Land Bank act, and we are prepared to defend it. Since Mr. Hennessy and the papers that support him are challenging debate, they now have their opportunity. The best farmers throughout the State exercised their influence for the passage of this law, and without regard to their personal political preferences, co-operated with Governor Glynn and its other sponsors in securing an appropriation and an organization for putting the system in working order. It is no less than an insult to their intelligence to be told now that the measure they adopted for their own benefit, will be an instrument to rob them.

In the meantime the Land Bank is well under way for organization. About 50 associations have subscribed for Land Bank stock. More than $70,000 is already subscribed; and new subscriptions are coming as fast as the associations can get the proper authorizations of their members. The charter is being prepared. The by-laws are about ready, and the Land Bank will soon be a reality, with $100,000 all ready to loan on farm and home mortgages in the State of New York, and with authority to secure $2,000,000 on its bond issues to loan for the same purpose. When this is exhausted these sums may be duplicated indefinitely. There are mortgages on farms of this State that have been in existence for 70 years. Four or five times the original mortgage has been paid in interest, and the original amount is yet due and must be paid in bulk. The farm mortgage indebtedness of the State is about $100,000,000. Much of this pays six per cent. interest; and if we count the expense of renewals the total cost would probably exceed six per cent. on the whole per annum. No man can say definitely just what this saving will be. No one attempts to say that; but if these mortgages can be amortized on the basis of the German and French loans, then the direct saving to the farmers of New York State would be in excess of $24,000,000 in 10 years. The saving would be proportionately greater on a longer period. There is no good reason why we could not equal the success of the European farmers in financing farm credit, and while we may not reach the full results at once, we believe that in a short time we can exceed their results.

The indirect result of this system to the farmer and home builder exceeds the direct saving. The money now saved by farmers and wage earners, and deposited in banks, or used to pay insurance premiums, goes out of their reach and influence to finance railroads, or other large speculative enterprises. The savings banks, the trust companies, the national banks, and the insurance companies do not to any extent invest in mortgages on farms or small homes. This is intended as no criticism of them. They have their own uses and their own functions. They handle large sums. They could hardly afford to bother with small problems. The point is that whatever money the farmer entrusts to them goes to build up other industries and not back to help other farmers. This Land Bank system keeps every dollar saved in the place where it is accumulated, and in the hands of the persons who saved it and own it. Not only this, but it gives them the power to borrow still larger amounts at low interest rates from sources outside their own circle. So that instead of sending their savings out of their own reach to build up other sections and industries, they use it at home to attract more capital to themselves from the outside to build up their own section and their own industries. They gain experience and courage and skill in the management of affairs from the experience of doing things for themselves. We would like to have Mr. Hennessy and his political editors tell us how this is to work a robbery of the man or the community that makes use of its possibilities.

THE R. N.-Y. has no concern in the political aspirations of the gentlemen who have sought to promote their fortunes in an attack on the Land Bank, in an apparent effort to detract from the measure of credit due Governor Glynn for his part in it; but we will not silently permit them to malign the Land Bank system which is now being organized in this State, and which is attracting the attention of farmers and Grangers in every other State in the Union. If their other protestations are founded on no better information or no more sincere convictions than their criticisms of the Land Bank, then we do not hesitate to say that they are mighty poor leaders for farmers to follow. J. J. D.

WESTERN APPLE GROWERS' PROBLEMS.

THE apple growers on the Pacific Coast find their business severely injured by the European war. A good proportion of their fruit has, in former years, been sent to Germany and Great Britain, where it found profitable sale. Europe has little time to eat apples at present, and less money to pay for them, and thus the great output of fruit from the Pacific Coast must find a new market, and go out for it in the face of serious competition from a large crop in the Eastern States. It is a serious problem for these Western people, but it must be said that they are meeting it in the best possible way. They are already organizing an immense "by-product club," and they are ready to spend their last dollar in advertising their fruit and organizing new methods for its distribution. Thousands of dollars will be offered for prizes both for fruit exhibited at the shows and also for orchards. Large prizes are to be given to the men who can show the greatest profit from 100 fruit trees, and all sorts of schemes are being developed for putting this Western fruit before the people in tempting array. Among other things proposed is to take the fruit which wins prizes at the great shows and distribute it to Senators and Representatives at Washington, judges, and all prominent men. If the Western people have their way the men who make public opinion will go about this Winter with their pockets stuffed with fine apples. Instead of smoking a cigar or taking a drink, it will be popular to eat an apple, and these Western people are apparently ready to give up half their crop this year in this plan of encouraging apple-eating. These men are up against the real thing in trouble, and the distribution of their crop has become a big problem. It must be said that they are meeting it in just the right way. This country can take care of three times as much fruit as is now consumed, if the growers can only make the consumers understand the profit and pleasure of apple consumption. The Western men understand this, and they are going after the trade. Our Eastern fruit growers will have to meet them in a liberal and enterprising way, if they expect to hold their own in the market. This year of large crop and curtailed market can be made the most profitable season our fruit growers have ever known if they will follow their Western brothers and put their fruit on the market at a low figure, and spend a fair share of their income in advertising their goods.

PRICES AT PUBLIC MARKETS

THE work of educating city people in buying food to advantage goes on. Thus far this is the best that has come from the free public markets in New York. The following lists of comparative prices at stores and at public markets were compiled by the Fifth Avenue Coach Co. for its employees. Labor unions and other organizations are now working for improved free markets and an extension of the service:

Market Price.	Store Price.
Potatoes, 8 lbs., 10c.	15 lbs., 25c.
Onions, 2c. per lb.	4c. per lb.
Carrots, 3 bunches, 5c.	2 bunches, 5c.
Bananas, 8 for 5c.	1c. each.
Tomatoes, 10 for 5c.	1c. each.
Peaches, 10c, per doz.	15c. per doz.
Grapes (green), 6c. lb.	8c. per lb.
Grapes (black), 5c. lb.	7c. per lb.
Celery, 5c. bunch	7c. bunch.
Cabbage, 3c. and 5c. head	6c. and 9c. head.
Beets, 4 bunches, 5c.	2 bunches, 5c.
Green peppers, 6 for 5c.	3 for 5c.
Red peppers, 6 for 5c.	3 for 5c.
Cantaloupe, 3c. and 4c.	5 and 8c. each.
Corn, 10c. and 15c. doz.	18c. and 22c. doz.
Cucumbers, 1c. each	3 for 5c.
Seckel pears, 2c. doz.	5c. per doz.
Apples, 6 lbs., 10c.	6 lbs. for 18c.
Lemons, 7 for 5c.	3 for 5c.
Catsup, 9c. bottle	10c. bottle.
Plums, 4c. doz.	7c. doz.
Fresh eggs, 11 for 25c.	9 for 25c.
Sweet potatoes, 4 lbs. 10c.	5 lbs. for 15c.
Porterhouse steak, 18c. lb.	26c. and 28c. lb.
Sirloin steak, 18c. lb.	26c. and 28c. lb.
Prime ribs beef, 16c. lb.	22c. per lb.
Leg mutton, 12½c. lb.	16½c. per lb.
Porgies, 5c. lb.	3 lbs. for 25c.
Flounders, 5c. lb.	3 lbs. for 25c.
White fish, 5c. lb.	3 lbs. for 25c.
Weak fish, 5c. lb.	3 lbs. for 25c.
Chuck steak, 14c. lb.	16c. per lb.
Pears, 10c. doz.	18c. per doz.
Lima beans, 5c. quart	7c. per quart.

Average saving, 38 per cent.

This means a saving of from 12½ to 60 per cent. in price through trading at the free markets. The system has only been started, and is but a very small thing thus far, because the supply of food which can be hauled into New York will always be small. The principle of the free market is correct, and the system must be extended. There should be convenient terminals in New York for receiving farm produce, and an organization here for distributing it. This must come in time. The thing to do now is to keep at the people until they realize that direct buying is their best economy.

ONE of the imaginations of Fall is the idea that forest leaves are very valuable as manure. They have some value, but they are so light and bulky that it will hardly pay at present labor prices to gather them. If you do get them use as bedding and mix with manure.

HEARD AT NEW YORK FREE MARKETS.

"THERE are only three or four of us patronizing this market on 130th Street, New York," said John Hirsch, of Rockland Co., N. Y. "There are two things which we farmers need to make success of this marketing idea; we need auto trucks, and we need market stalls. I could not be here were it not for my truck. I live out 30 miles. I can't drive fast, and it takes me about three hours to come in, cross the ferry and be on the ground ready to sell. I tried to shorten my time; had a load of peaches, and when I got here I would have sworn they were not my goods. They were badly shaken and bruised. Where the idea of having a stall will help me, is that I have to spend pretty near all night getting here, and then a good part of the day in selling out. You might say that each trip costs me a night and a day. My auto truck here is idle while I am selling from it. With the market stall I could rent quarters, install a 'phone, and when I would run low, could call up the farm; they could hustle in needed supplies, and I would not be overstocked nor sold short. The boys right next me employ this system with horse. One remains here and the other makes trips to and from the farm. It is about 20 miles to their place. If there should be a permanent market, they would be benefited by the telephone, by a definite location, and would not need a wagon tied up continually.

"Here again the competition of the hucksters is a stimulant rather than injury. They all seem to do business squarely. They specialize. Some sell oranges, some bananas, some have a load of corn, while we farmers have a diversified load. We have to load up with a variety which we can sell in a day and get back home. Those fellows, like the one over there, with a load of sweet corn, can be right here to-day, and to-morrow, until he gets sold out. He gets his rest besides. This fellow over to my left is a fair example of the farmer with some one thing. This farmer came this morning (Wednesday). He has eight barrels of pears. They are suitable only for canning. His receipts will be small, and he says he will probably be compelled to remain until Saturday night. It will not pay him. He would better allow a commission merchant a dollar on a barrel, or sell to some huckster, than spend his time and be at the expense of selling his fruit. Here is where the stall would benefit this man. He and three or four of his neighbors could co-operate. They could use wagon or truck, keep in touch with their quarters daily, and keep one person there. A woman, a young man, or a girl, could do nicely selling, and they could take turns selling and supplying the location, and in this way the proposition would pay them. It is not a case of competition, for the more good fresh fruits and vegetables come from the farm, the better and higher will be the class of our patronage, and this means more money for us." W. J.

JERSEY CITY MARKET.

JERSEY CITY has established a public market on Railroad Avenue, near the Grove Street tube station. This is where the Pennsylvania Railroad elevated its tracks several years ago, and is a sheltered place, with plenty of room for farmers' wagons. The market, though established late in the season, was a success from the start, and promises to be of great importance to the food trade of Jersey City. It is accessible to a large number of New Jersey farmers, and all who have attended thus far appear to be satisfied with the results. The market is open to both wholesale and retail trade, and is an especial convenience to the grocers and peddlers, many of whom have previously had to cross the ferries to New York for supplies. This wholesale trade begins early, usually before daylight, so that farmers who close out their stock in this way are able to make an early start for home. Others who wait for the housewives' trade do a brisk business until about 9 A. M., when practically everything is sold.

The goods available at present are: Peaches, pears, tomatoes, muskmelons, beans, kale and other greens, peppers, eggplant, corn, etc. Some of the prices were: Corn, $1.75 per hundred, 30 cents per dozen; eggplants, $1.50 per barrel, five to 10 cents each; tomatoes, 40 to 60 cents per half-bushel basket; string beans, $1.25 per bushel, two quarts for 15 cents.

Along Railroad Avenue are several vacant buildings, and it seems probable that some of these will be rented for produce stores, where foods not handled by local farmers will be sold. This would widen the field of the business and draw additional trade to the market. Altogether the prospect is favorable for a permanent market on the healthy basis of profit to the farmer and convenience and profit to the buyer.

GOVERNMENT CROP AND WEATHER NOTES

OVER the principal corn growing States the crop has matured without injury from frost, cutting is progressing rapidly, and much of it is now in shock, with prospects of a fair yield.

In the Winter wheat growing States the weather has continued favorable, the soil remains in good condition, except in portions of the Atlantic States, and seeding is progressing satisfactorily, except that it is being delayed to some extent to avoid damage from fly. Tobacco has improved greatly and much is now being housed. Pastures are reported in excellent condition in most districts and feed of all kinds is plentiful.

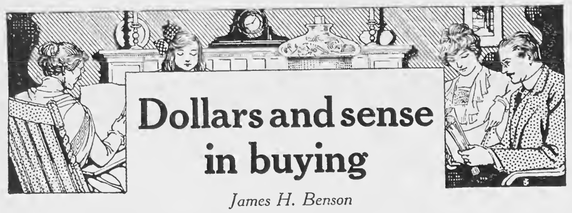
In the Spring wheat States the weather was favorable for all farm work, and most crops are now safely housed. In the cotton region some damage occurred from wind and heavy rains, and picking was slightly delayed, but on the whole the weather was favorable for picking and for the development of late cotton and the top crop, although these are reported as being injured in some districts by insects.

Over the Atlantic States, from Virginia northward, severe drouth continues over much of Pennsylvania and New Jersey, and plowing and seeding are delayed. In other portions of this district the weather was more favorable, and the ripening and gathering of crops and preparations for seeding were continued without interruption.

Over the range country of the Southwest grass is maturing under favorable conditions, and stock is reported ready for market.

Over the northern portions of the mountain and plateau districts favorable weather for Fall work continued, except that the ground is too dry for seeding in some localities.

In the fruit growing regions of the far Northwest apples are being picked, the hop harvest has been completed and other farm work progressed satisfactorily. In California damp weather caused some injury to raisins, but the gathering, drying and shipping of other fruit crops continued without interruption.



Dollars and sense in buying

James H. Benson

NOTE: Making two blades grow where only one grew before, is the new note in modern farming. Making one dollar do the work of two, is the new note in modern buying. The art of saving money is just as important as the art of making money. If you believe in the old adage, "A penny saved is a penny earned", you will profit by reading this article. Even if you are now buying your needs by mail, this article will open your eyes to the TRUEST economy in mail order buying—will show you how to make your money buy more. If you buy in your local town or in some larger town nearby, this article will tell how to shop in New York, the World's Greatest Commercial Center, with greater convenience, greater economy and greater satisfaction. Dollars and Sense in Buying is a mighty big subject, worthy of your most careful consideration. Read every word of this article carefully and you will know the reason for the tremendous growth of the Charles William Stores.

ALERT, progressive farmers everywhere know that the Mail Order way is the most economical and most satisfactory way of purchasing merchandise of every kind. They know that the big Mail Order houses offer the lowest prices, the most complete selections, and the strongest guarantee of satisfaction.

Dealing with almost any Mail Order Company is far more economical and assures you of greater satisfaction than going to the local town or to some nearby larger town for purchases of importance. But, as in *every* line of commercial endeavor, you will find many advantages in dealing with one company in preference to others.

New York Public Library at 42nd Street and Fifth Ave., near New York Central Terminal. Largest public library in the United States.

In buying by mail, there are five things to consider carefully before sending your order. They are:

1. Price.
2. Quality.
3. Quick Service.
4. Transportation Charges.
5. Guarantee and Reliability.

It is our purpose to show you why you may expect these advantages in a *greater* measure from The Charles William Stores than from *any other buying source anywhere.*

A pleasant surprise for farmers

Sixty per cent. of all merchandise sold in America originally comes from New York. The Charles William Stores are located in the *heart* of New York. We buy from first hands. Our buyers do not take annual trips to New York because they are always here—always on the ground to watch for buying opportunities. Think of it!—243 out-of-town buyers *registered* their arrival *in one day* in the New York Times. It is safe to say that not one in ten visiting buyers registers. From Pittsburg, Philadelphia, Chicago, St. Louis, and even as far west as San Francisco, they come once or twice a year to buy at *headquarters!* But *The Charles William Stores'* buyers are *always* on the ground, ready to snap up exceptional values at a moment's notice, ready to get the newest merchandise.

Because of our remarkably low prices we have found it necessary to add a six story building, another five story warehouse and eight floors in still another building to our already large quarters. Nearly a million new customers joined The Charles William Stores during the past year! Why? Primarily because our prices save them money over the prices quoted by others. Nobody buys on sympathy or sentiment. It's a cold, hard, *business* proposition with our customers—a *dollars and cents* affair that we must make good on. If we don't save *you* money, *you* won't buy from us. We ask you to compare prices—then decide for yourself.

The question of quality

For example, in the matter of fashions. Everybody knows that New York is the style center of America. Every woman wants the styles that will be worn in New York. Located as we are, in the heart of New York, we are in a position to know far in advance, just what styles will be wanted by women everywhere. There's *quality* in every style, *quality* in every inch of the fabric, *quality* in every stitch, *quality* in every curve of the garment you buy from The Charles William Stores—yet the prices are exceedingly low. And this spirit of high quality extends to *everything* described in "Your Bargain Book". You'll find it in *Jewelry, Dry Goods, Toys, Toilet Articles.* You'll find it in *Furniture, Carpets, Rugs, Musical Instruments, Chinaware.* You'll find it in *Sporting Goods, Bicycles, Auto Supplies, Paints, Hardware, Farm Implements, Engines, Separators, Harness, Vehicles. Quality first* is The Charles William Stores watchword.

24-hour delivery service

So important do we feel it to please you on quick shipments as well as on the merchandise, that this is what we do to enable us to ship orders *the day they are received:*

automobiles are at the Post Office to bring the mail to us to save *half an hour.* As each order is opened, the time is stamped upon it and *the time for shipment, just exactly 24 hours* from the time it is received.

If for any reason the articles in your order cannot be shipped that day or by the following morning, a postal will be mailed to you, telling you why. Delays happen sometimes, of course. It is impossible for them not to, among the thousands of orders received, but the exceptions are rare.

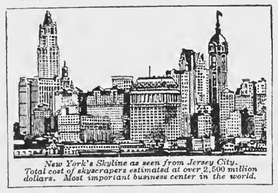
To figure when you will receive the things you order, allow for the time it will take your letter to reach New York and for the goods to reach you from us; *add one day*, and unless you are notified to the contrary, you will have your things. Our customers appreciate this extra speed in filling and shipping orders. They have grown tired of waiting, waiting, waiting for their goods to arrive, worrying and fretting for fear something has gone wrong. Now all that is past. *The Charles William Stores'* way of doing things suits them to perfection. They want their goods quick *and they get them* quick. No delays—no unnecessary correspondence.

Times Square, between 42nd and 47th Streets," 40 theatres and 75 large hotels and restaurants are within a radius of 400 yards.

The Charles William Stores is but six city blocks from the Post Office, but we do not wait for the letter carriers to deliver our mail. Before our Stores themselves are opened, our

Nothing to pay when the goods arrive

Wherever you live we pay transportation charges on everything in the first 342 pages of Your Bargain Book. On all other merchandise we pay freight on shipments of 100 pounds or more, to the States of Maine, New Hampshire, Vermont, Massachusetts, Connecticut, Rhode Island, New York, New Jersey, Pennsylvania, Ohio, Virginia, West Virginia, Maryland and Delaware. If you live beyond, we pay a good part of the freight on all shipments of 100 pounds or more. Remember, we pay transportation charges on everything shown on the first 342 pages of Your Bargain Book, *wherever you live. Nothing for you to pay when the goods arrive.* No other Mail Order house treats you as liberally as The Charles William Stores. You know exactly what your purchase amounts to, without wondering what the freight charges will be! Think what a great advantage that is, especially if you have been buying from some *distant* Mail Order house.



New York's Skyline as seen from Jersey City. Total cost of skyscrapers estimated at over 2,500 million dollars. Most important business center in the world.

Does it pay?

Thousands can answer that question for you—people who are now purchasing goods from us regularly. Your money will buy more—comparison of prices and quality will prove that to you. You can *depend* on us—that you will learn by your first purchase. You will be glad of our freight prepaid offers, wherever you live. You will appreciate receiving new, fresh goods. You will like our 8-hour service, which prevents delays in sending your order. And you will appreciate the kindness and consideration with which we treat our customers.

Complaints are welcomed because they give us an opportunity of correcting errors and increasing our efficiency. We want no silent grievances. We would much prefer to accept a total loss of a suit, or a plow, or *anything* purchased from us, if you are the least bit displeased with it, or if you have changed your mind, than to have you keep the goods.

It has been our experience that customers are fair. When they return merchandise or make complaints there are reasons. In all cases, reasons or no reasons, we treat our customers exactly as *we* would want to be treated. We return the full purchase price immediately upon request. There are no questions, no quibbling, no correspondence, no printed excuses, no "red tape." And it makes no difference whether you return a packet of pins or a $500.00 gasoline engine. That is The Charles William Stores way of doing business. Everybody likes it, judging by the generous measure of orders we are receiving.

Your Bargain Book

Our new Fall and Winter Catalog is ready. If you haven't received a copy, send us the coupon at the top of the next page—or just a postal card. Judge our book by any other—Judge our prices, our service, *everything.* You and your family are the ones to say whether or not The Charles William Stores meet your demands of what *your* Mail Order Company should be.

Statue of Liberty, N.Y. Harbor

Your money buys more, *we pay delivery* charges, *you get quicker service* and fresh, new merchandise—and you are always treated with respect and courtesy under every condition—when you deal with The Charles William Stores.

Mail coupon or postal for Your Bargain Book, 1186 pages, fall and winter edition Now Ready

Let us mail you a copy of "Your Bargain Book". The fall and winter edition is now ready. Our customers say it offers greater advantages than any other big mail order catalog published. We would like to know *your* opinion of it. Mail us the coupon, or just a postal card, and your copy of "Your Bargain Book" will be sent to you at once, free and prepaid.

When "Your Bargain Book" arrives, look through it—see how easy it is to shop in *New York* without leaving your home—see how much *less money* it takes to supply your wants—see how *it makes every day a red letter bargain day*—see how much money you save because *we pay* transportation charges.

If you send us an order—even a *small* order—you'll understand what we mean by *24 hour service*—you'll know what we mean when we promise you clean, fresh, new goods—you'll notice the respect and courtesy with which we treat every customer under *all conditions*—you'll know why *nearly a million people* have found, in the last 12 months, The Charles William Stores an ideal place to make their purchases.

We want you to have "Your Bargain Book". You are urged to send for it *today.* Use the coupon printed at the top of this page—or just a postal card—but please do it now—before you forget. We are sure you will be *glad* you wrote for it.

207 STORES BLDG., 115 EAST 23rd STREET, NEW YORK

Woman and the Home

From Day to Day

TO THE FRINGED GENTIAN.

Thou blossom bright with Autumn dew,
And colored with the heaven's own blue,
That openest when the quiet light
Succeeds the keen and frosty night.

Thou comest not when violets lean
O'er wandering brooks and Springs unseen,
Or columbines in purple dressed,
Nod o'er the ground-bird's hidden nest.

Thou waitest late and com'st alone,
When woods are bare and birds are flown,
And frosts and shortening days portend
The aged year is near its end.

Then doth thy sweet and quiet eye
Look through its fringes to the sky,
Blue—blue, as if that sky let fall
A flower from its cerulean wall.

I would that thus, when I shall see
The hour of death draw near to me,
Hope blossoming within my heart,
May look to heaven as I depart.

—William Cullen Bryant.

*

AS we walked down one of the crowded streets near THE R. N.-Y. office recently we met with a member of the Apple Consumers' League in deep distress. She was a little girl of seven or eight, neatly dressed, though her little gingham frock was faded and not over clean, and her thin little braids tied with scraps of ribbon that looked like cigar bands. She walked up to a woman passing by, and remarked:

"Say, Missus, do you see them two boys what's eatin' an apple?"

The person interrogated nodded, noticing the two boys, who were rather larger than the little girl. They sat on the edge of the curb, sharing an apple and playing a game of chance.

"Well," continued the little girl, "that apple they're eatin's my apple—they took it off of me. My mother give me a penny to buy an apple, and I don't often get one, because my mother she says it's hard to get enough to feed the hull lot of us, and then when I got it they took it off of me before I got a taste of it."

The little girl did not cry or whine; she spoke with indignation, but with the reserve of one whose feelings were held in check. The woman addressed voiced her indignation, then suggested it would be a pleasure to supply means for replacing the apple. The little girl remarked, with dignity, that she wasn't asking for anything, but she agreed to take the offering remarking with some pride:

"Anyway, it took the two of them to take that apple off of me!" and darted across the street, almost under an auto truck, to chaffer with the Greek who keeps a fruit stand and, we hope, to secure a quiet place where she could enjoy her apple without fear of boy bandits.

*

THERE is no household where it is more necessary to study methods of saving labor than on the farm. It is not, in this case, a matter of cutting out senseless elaboration, but of reducing absolutely needful work to the minimum. Yet, whenever saving labor is contemplated, we are likely to find that some, at least, of the trouble cannot be eradicated without structural changes in building. For example, in an old house, there may be the nuisance of nailed-down carpets, unwholesome dust-catchers, a standing invitation to buffalo moths, and a back-breaking part of every sweeping day. Yet the floors may be so old and warped that they cannot be left bare, and the housekeeper must endure the trouble until new floors can be laid. Even then in the cold North bare floors are not comfortable where stoves supply the heat; one needs a cellar heating plant. So, to simplify labor, one needs, first of all, a cellar heating plant, which will keep the house at even temperature and do away with incessant dragging about of fuel and ashes. Steam or hot water heating pre-supposes a good water supply, piped in, not only to the kitchen, but upstairs also. The water supply naturally includes a bathroom and a laundry with set tubs, separate from the kitchen.

Are we suggesting luxuries in these things? No; we are suggesting necessities for comfortable living, that are everyday affairs to hosts of hardworking people. Nor are they comforts only; they are aids to one's self-respect. We believe that many young people who are sent to a town school, and come back dissatisfied with farm life, really feel the lack of these modern conveniences even more than the isolation or hard work.

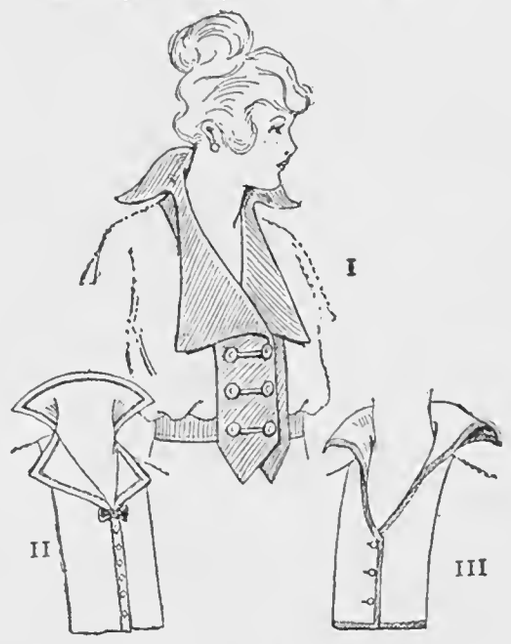
Labor saving appliances are plentiful; vacuum cleaners, fireless cookers, washing machines, etc., are all helpful. But heating, water and the disposal of household wastes are the three things not only fundamental in comfort and health, but on them depends the extent to which labor can be saved in other departments. Every farm woman knows this, and it will be brought before the family more and more, with the extension of knowledge in home economics.

What is the use of stating conditions we all know, when the one cause of narrow living, scanty comforts and overwork is ignored? There you touch on the great cause of unrest in every branch of labor—the need of a living wage. But before you can get what you want, you must want what you aim to get, and the farm woman, as well as the farm man, must formulate her needs, and the rewards she deserves.

The Rural Patterns.

When ordering patterns give number of pattern and size desired. Price of each pattern, 10 cents.

The three styles of collars shown will be found very attractive. Each requires such a small amount of material that, when home-made, the cost is trifling. To give a very dainty touch the collar and



fronts of number three could be embroidered by hand in some simple floral design. To make Number one will be required ⅞ yard of material 27, 36 or 44 inches wide; to make Number two, ⅝ yard any width; and to make Number three, ½ yard of any width with 2¼ yards of braid for binding.

8392, Gathered basque. Cut in sizes 34 to 42 bust measure. Size 38 requires 2⅝ yards of 36 inch material with ¼ yard 21 for collar and cuffs. 8420, Tucked blouse. Cut in sizes 34 to 42

bust measure. Size 38 requires 3 yards of 36 inch material with ⅞ yard 27 inches wide for collar and cuffs. 8344a, Basque with tunic. Cut in sizes 34 to 42 bust measure. Size 38 requires 4¾ yards of 36 inch material and ⅜ yard 27 for collar and cuffs. 8174, Seven-gored skirt. Cut in sizes 26 to 36 waist measure. Size 32 requires 3¼ yards of 36 inch, plain material. 8382, Three-piece skirt with long tunic. Cut in sizes 24 to 32 waist measure. Size 28 requires 2½ yards of 36 or 44 inch material for skirt and 2¼ yards for tunic.

Necessary Solitude.

I WAS married after a long girlhood, in other words, in the late 30's. In my old home, I had a large chamber, comfortably furnished, where I always could be by myself if I chose, and where all my personal belongings were together. As the years went by, it became to me a home within a home, holding my favorite books, pictures, souvenirs of happy trips, and all such precious things. Here on my writing table lay my diary, my Bible, and my stationery. Everything could be dropped at once, if I was called, with confidence that it would be undisturbed until my return. From the windows of this room could be seen orchards and grasslands sloping gently to a little lake.

Upon my marriage into a kindly and affectionate family, I still had pleasant rooms, but alas! no room where I could be sure to be undisturbed. If I sat down, with the wish for the quiet of former days, some kind soul was pretty sure to want to be with me, and how could I be ungracious? Yet the lack of occasional solitude wore upon me, and as time went on, my nerves wearied of the constant companionship even of those I respected and loved, and ungracious words and acts did often escape me. For years I longed for privacy, and tried various methods to obtain it, yet usually failed. All of the house was mine, yet none of it was mine exclusively.

At length a plan worked out in my brain. In the back of the house was a great pantry, all out of proportion in size to the needs of the family. It had two windows, one of which was in a "jog" in the room, that was about six feet square. I moved things out of this jog, and had a carpenter fit a partition of sheathing across it, including a door. This left one window for a pantry of much better size, and gave me a tiny room, with a window that looked out upon a beautiful range of hills beyond a river.

In one corner of this little den is fitted a set of shelves for my favorite books, a drawer for my papers, and below that, more shelves for the books of my church offices, for club books, etc. A table of generous size stands before the window, and one chair. Above, and at one side of the table, hangs a pretty cast-off dye case from the druggists, which with a part of the partitions removed, provides a set of shelves and pigeon-holes for letters and conveniences. My dictionary lies on a stand at the other side of the table. On the walls of this tiny room are clock, calendar, letter scales, and the interesting things that everyone likes to keep, with the wise or cheerful sayings of favorite authors. On the table are my Bible, papers, and materials for writing.

It is such a cubby hole that many would despise it. The only expense was about eight dollars for carpentering. It is so secluded that some would fly from it, but to me it is a place to work happily, a refuge—a sanctuary. Life is much less tense, nerves are quieter, and family life is happier because the mother has a place where she may "find herself."

MRS. E. FLAVEL.

MANNERS have an enormous commercial value in life. No one can have lived as long as I have without noticing the weight and value of manners in the ordinary transactions of life, in public life, and having seen men by appearance and manners get such a start of very much abler fellows that they have been able by appearance and manners to keep their place much higher in public life than their own abilities or service would entitle them to.—Lord Rosebery.

Write for Free Catalog today.

The United Pump & Power Co. 473 Dickey Bldg., Chicago

Seen in New York Shops.

A PRETTY little hat of a narrow-brimmed shape with sloping crown was of midnight blue velvet, having around the base of the crown a band, of blue moire piped with silver. The ends of the band were crossed in the back, and also crossed in front, with a small cluster of silver flowers. A good many hats show some metallic trimming, silver, gold or bronze, but such garniture must be used with good taste, or it has a "would-be" stylish effect.

Rainproof gloves of tan capeskin are new, and they may be washed with cold water and soap. They have stylish stitching of tan or black; $1.50 pair.

Burnt ostrich feathers are among millinery novelties. They are thin plumes that look as though all the fluff had been singed off, and are made up in clusters and "fancies." They are not very beautiful, as a rule, for a good many of them suggest discarded trimmings, but for the moment they are very fashionable.

Plain walking hats are described as "trotteur" hats, just as the plain tailored suits are "trotteur" suits. Among young girls' black velvet hats a favorite model is the "beret," which, as its name implies, suggests a priest's biretta. It is rather flat, loosely draped with velvet drawn towards the center in folds like the sections of a biretta, and simply finished with grosgrain ribbon. Such a hat is offered for $3.50. Black velvet trotteur hats for women, in sailor, tricorne and turban styles, trimmed with fur, metal galon or silk, are offered in great variety for $5, while tailored velour hats, in black and colors, trimmed with ribbon bands, cost from $2.95 up. Then there are plain sailor hats of silk velvet and hatters' plush, with no trimming except moire bows, that are priced at $14, but they are copies of new French models made up in high-grade materials.

Monkeyskin trimming is sold by the yard at 45 cents to $1 a yard for single edge, used as a border, and $2 a yard for the double edge used for cuffs and collars and bandeaux on hats.

Many of the leading shops now make a specialty of American-made silks, and announce the fact quite as proudly as they formerly called attention to imported goods. Many of these are 36, 40 and 42 inches wide. Among them are satin charmeuse, crinkle crape, crepe meteore, faille souple, etc., at from $1.95 to $2.85 or over a yard. It must be remembered that these silks are so wide that they cut to great advantage, unlike the old 18 and 22-inch silks that used to be made up into wide skirts.

Very practical coats for young girls are made of Scotch tweed, dull mixed colors with gray, green or brown predominating. A favorite style has raglan sleeves, a wide flaring collar, deep cuffs and a wide low-placed belt fastened with large buttons. These coats, in very good tweed, cost about $12 to $15.

Smart new veils have a filet mesh. This square mesh is becoming, and is not so trying to the eyes as a fancy mesh. Some of the veils are plain, others dotted or figured; many are bordered. In addition to black, white and flesh, these veils come in mousse (moss green), aubergine (eggplant) rhubarb pink, ambroisie, which is a soft red, and paon or peacock. Lace veils come in black, white, blue and the dark brown called tete de negre. Washing veils of white lace in shadow weaves are very popular.

Tested Grape Juice.

J. M. R. asks how to make grape juice; this is my way: 10 pounds grapes, stemmed and washed, two quarts water. Boil 10 minutes, strain without squeezing, add two pounds sugar, bring to boil, bottle. This makes four measured quarts, and is very sweet and rich, so we get just equal to 10 of the 25-cent size grape juice bottles ($2.50) for the two pounds of sugar, and this is double the strength of any I ever bought. Some, I put in any shaped bottles with new corks. Then I fill the heated bottles overflowing and pour back one inch of juice into kettle, quickly cork, taking corks from pan of boiling water, press in all the way. When cool, seal over with paraffin. Other times I use pint or even quart jars, but when opened it cannot be kept more than a day or two without souring a little. If ever any has worked in the bottle, as has occasionally happened, boiling up again seems to restore sweetness. In serving it we fill tumbler one-third full of juice and fill with cold water. In sickness we sip it only slightly diluted; often use it, too, in lemonade—or with a beaten egg. My way of squeezing the grapes now, is to put the jelly bag in the lard press and press only slightly, not enough to cloud the juice. The residue makes fine jam.

E. A. L.

Educating Children at Home.

I HAVE two children, age three and five, and would like them to enjoy some kindergarten work. We are too far away from a school to send them so early, so I should like to get kindergarten ideas into their heads instead of mischief. I have read a little about the Montessori method. Could you tell me some book concerning this method? Would it be practical for a busy housewife to attempt such a method? Can you give me some information on home education?

MRS. M. J.

This letter touches a subject of importance to many mothers. Isolated farm homes, even in the Eastern and Middle States, often hamper the parents in providing systematic education, while this becomes a far more serious problem in sparsely settled localities in the West or Southwest. The National Bureau of Education has received so many appeals from parents in lonely districts that they have now established a Division of Home Education, which coöperates with the National Congress of Mothers. A series of bulletins on home educational problems has been prepared, so Mrs. M. J. is advised, first of all, to write to the Division of Home Education, U. S. Bureau of Education, Washington, D. C., stating her problems, and asking for any bulletins bearing upon them. She will receive expert advice adapted to her special needs.

A most interesting book on the Montessori system is "A Montessori Mother," by Dorothy Canfield Fisher, and this will be found very helpful. It will suggest ideas and methods that may be used by a busy mother, even though she may not feel able to carry out its teachings in full. Another useful book is "Educating the Child at Home," by Ella Frances Lynch, which suggests simple and effective methods of utilizing the child's natural curiosity in imparting instruction.

This subject of home education should be utilized in bringing rural women together for club or society work. A woman who tries to teach children at home soon learns that any normal child can ask more questions in a day than she can answer in a month, and she is thus led towards new lines of study herself. The most common defect in home teaching is a tendency to omit subjects that either mother or child is not interested in, especially such essentials as arithmetic and grammar in its drier forms. But these are touched but lightly in kindergarten and primary classes; if the mother forms habits of intelligent reasoning, fixes the attention and gives a respect for discipline, her little pupils will not be found deficient when they enter higher classes.

NATIONAL CLOAK & SUIT CO. 273 West 24th St., New York City.

A DRESSMAKING LESSON.

Making the New Basque.

THE basque is among the most popular new models, and a little instruction regarding it may be helpful. The lining consists of two pieces, front and back, shown in the diagram laid out on

THE GATHERED BASQUE 8338A.

material 36 inches wide. Whether this material shall be silk or mercerized cotton must depend entirely upon the material from which the gown is to be made. The basque itself can be of any material soft enough to be made full. In the diagram, the basque is shown laid on such material 44 inches wide. The dotted lines that indicate the second collar and second cuffs are to show where the lining can be cut.

Pin the various pieces carefully into place and mark all around the outside edges of the pattern with tailor's chalk, marking all the perforations and notches. Cut as far beyond the edge for seams as the material requires. For the satin, one-half inch will be sufficient. Take up the deep darts that extend from the lower edges of the lining fronts and the darts from the shoulders of the basque by bringing the corresponding lines of perforations together, baste and stitch on the right side. Split the darts at the folded edges and press open. Join the lining backs on the marked outline and press the seams open. Then gather both the fronts and the back on the under-arm and front edges between the double crosses and arrange each portion of the basque over the corresponding portion of the lining with the shoulder edges exactly meeting. Baste on the marked outline and try the garment on the wearer. It should not be tight, nevertheless one figure may require the under-arm seams to be taken up a little more than another and it is just at this point that any necessary changes must be made. When the basque is adjusted, stitch the seams.

Next slash each under-arm seam three-quarters of an inch above and three-quarters of an inch below the waistline to allow spring for the figure, and curve the edges of these slashes. Bind each edge of the seams separately wtih a thin silk binding, taking in the material of the basque and the material of the lining in each case. Press the seams open and flat.

To finish the front and back edges with cords, as illustrated, cut bias strips of material one inch in width and fold at the center over a cord, basting the two edges together within the cord; then baste over the edges of the basque with the folded edges of the silk meeting the edges of the basque. Cut straight underfacings one inch in width and the length of the basque and arrange one of these over each front. Baste and stitch together close to the cord. Turn the facing under the basque, and fell the edges to the lining only.

Stitch the lining and the outside of the collar together with the right sides meeting, turn on the seam, baste and press. Arrange over the basque with the right side uppermost, the center back exactly meeting the center back of the basque; roll the collar down and stitch the lining to the edge of the back on the marked outline. Fell the edge of the collar over the seam; then roll the collar back on the perforations. Close the seams of the sleeves. Join the ends of the cuffs and line them. Arrange over the sleeves with the large perforations at the seams and the notches meeting. Cut bias strips one inch in width and under-face. Place the sleeves in the armholes with the notches exactly meeting and the single large perforations at the shoulder seams of the basque. Baste carefully and stitch, using the marked outline as a guide.

Close either with buttons and buttonholes or with buttons used for ornament only and snap fastenings. For the complete garment will be needed 1⅝ yards of material 44 inches wide and 1⅝ yards of lining 36 inches wide.

To Make Money.

IF you want to save money, why put it away,
And let it lie still till a rainy day,
Then if you would double it, take out a bill,
And fold it across, any way that you will.
You will find for your trouble
Your money is double,
And all men can see without banks or leases.
Your money thus doubled, is always in creases.

The above isn't written from memory, although the idea was instilled many years ago, in an old scrap of a poem, the writer of which I cannot tell. I hope, however, to give a method of increasing money a little more satisfactory than that above.

There are very few women who haven't some ability a little more in evidence than other abilities. A woman on a farm who had been practically shelved, from ordinary work, began showing young people how to do certain things. For instance, the woman had learned to make tatting years ago, and an old tatting shuttle had lain around for many years. This was brought forth and she picked up the old work. The revival of this art led others to want to learn it, so she decided that she would open a class in tatting. The young girls around came in and at 10 cents an hour for the lessons, felt little drain on their purses, and yet the little received helped the woman considerably, more in fact, from the consciousness that she was not wholly useless and helpless than in a financial way, but the little work begun broadened out in other ways. Some were slow in learning to tat, and yet persistent, and one young girl, who spent a dollar in learning the mere stitch felt highly satisfied. She declared that while she had spent a dollar in learning the stitch, she should save many dollars by making her own trimming, which is a very sensible way of looking at the matter. Another young girl who learned the tatting, has made over fifteen dollars in tatting this Summer. She makes a common, plain tatting for 15 cents a yard, and she has made yards and yards of it. Others finding that she does the work reasonably, have had her make some especial kinds for which she gets from 15 cents up for her work. She made one baby bonnet for which she gets five dollars. The woman who taught the art, frequently has this girl as a pupil for an hour or so, as the teacher is ingenious and inventive she thinks up new ways and combinations, and these she teaches at the regular rate, and she can teach a good-sized class at once, especially if all are learning the same pattern, althongh she can handle several different methods at once. It is astonishing the furore for tatting. This woman makes medallions of various sorts for insets in waists, etc. For one woman, she made a triangle of wheels, and three small wheels; these were used as insets on a vest front to a dress. After these were made it was decided that an edge was wanted, and the woman offered some clover-leaf tatting she had made, and it was accepted. The medallions sell from 15 cents each up, according to the style and work employed. A lot of jabots of tated wheels were made to sell at 50 cents each, that is for the two wheels joined.

Having had good success teaching tatting she took up crocheting, beginning with the simplest forms, for the ends of bath towels, and going on to more intricate things. Her charges are so very reasonable for teaching that even real young girls avail themselves of her lessons; she has the faculty to teach, which helps much. These lessons she does not hold more than an hour, or at the most two hours at a time, as she has not been fit to do more than that, but she has earned a little money for her own use, and has helped to keep her heart and mind interested, besides getting in touch with the girls of the neighborhood, which has meant much to her.

Once beginning she has forged ahead, slowly, and a little at a time, she had made sales for her work, although she has not advertised it, nor has she preyed upon the good nature of her friends, in fact she has never solicited work, but it has slowly come to her. She was lucky enough to find a woman's exchange which had just started, and which wanted work for sale, and the work was accepted with no entrance fee, but a charge of 10 per cent. commission was allowed for the selling. It is a wonder that more women who have ability to do work of this kind don't try the exchanges, for nearly everything can be displayed there, and in time be sold.

A carpet warp bedspread was made, using filet crochet patterns for the work, the pattern being extremely original, having initials crocheted in and at the top of th spread the words, "Peace to Thy Slumbers," all done in crochet. This spread the invalid made at odd times, and it is not for sale, but it will be shown at fairs and probably she will get premiums on it, for its very originality. Moreover, girls who could not pay her money, for learning the work, often paid her by work, which she could not do herself, and so a sort of neighborhood coöperation was begun.

One might put her tatting and crochet work in stores to sell, but she gets a better price if it is sold to individuals. With an eager interest in some thing one will find time to do it, and it is astonishing the number of yards of tatting which can be done at odd moments. The girl who sold her tatting for 15 cents a yard, learned that it was hardly enough, as the thread used was the best made for such work, and the cost of the thread took off the profits, so that now she lets the buyer of the tatting buy the thread, and the price is just for the work alone.

DIAGRAM OF BASQUE LINING.

Making Sauerkraut.

WOULD you give a good reliable recipe for sauerkraut. Your Rural Cook Book is in constant use in our family, but find no kraut recipe.

MRS. L. K. M.

Will you tell me how to make sauerkraut by the barrel, and also in what different ways it is prepared for the table?

C. L. M.

The preparing of plain sauerkraut is very simple. Select sound hard cabbage, remove and discard the loose outer green leaves. Quarter the heads, cut out the cores and the bases of the large outer mid-ribs. Then slice with a sharp knife, cutting into fine strips lengthwise. Sauerkraut cutters are made for both hand and machine power, and ar very convenient, as a sharp knife is needed, and a careless person may easily cut himself with an ordinary large knife. Weigh the sliced cabbage, and for each pound of sliced cabbage allow one-half ounce of table salt. Dust salt in the bottom of a clean keg or earthen jar and put the cabbage in it in layers, dusting each layer with salt. On top of the last layer add more salt in the proportion of one pound of salt to each 100 pounds of cabbage. The cabbage should be pressed down firmly; some housekeepers pound it down with a wooden pestle. Sometimes juniper berries are added to the top layer of salt, a handful to each 100 pounds of cabbage, but this is a matter of taste. A loose cover is then put on, with a heavy stone on top to weigh it down, so as to keep the cabbage under the brine that is formed. Keep it in a cool dark cellar, and skim off any scum that forms as it ferments. If the brine lessens much as the sauerkraut is used, add enough brine to cover it completely, and always keep the cover with weight on top. Experienced housekeepers rarely weigh their materials in making sauerkraut, as their rule-of-thumb knowledge is sufficient.

When preparing for the table, take out the required amount, rinse in cold water, drain, and boil like cabbage. Salt pork, ham or corned beef may be boiled with it if desired; sparerib or sausage are also desirable accompaniments. After boiling it is often warmed over in the frying pan with bacon drippings or other fat, and many consider it more savory in this form than boiled. This sauerkraut sauté, if we may be allowed, at the present time, to combine a French adjective with a standard German dish, is desirable with Hamburg roast—that is, savory chopped beef baked in a roll. Some boil the sauerkraut a long time, until it becomes quite dark colored, but it is usually only boiled until tender and white. It becomes dark when warmed over in the pan. Another savory dish is sparerib stuffed with sauerkraut; the boiled kraut is laid on the hollow side of the sparerib, which is folded over it, and then cooked in the oven.

Sauerkraut is sometimes made from red cabbage, while a Thuringian recipe calls for caraway seed, the same amount by measure, not weight, as of salt, and some sliced tart apples.

BAKED EGGS WITH HAM.—Mix a cupful of finely chopped ham, half a cup of bread crumbs, one teaspoon of chopped parsley, one teaspoon of butter, quarter teaspoon of made mustard and enough hot milk to make a smooth, soft paste; spread this in buttered scallop shells, break an egg into each shell and sprinkle with buttered crumbs. Bake in a quick oven until the crumbs are brown and the whites of the egg firm.

WAFFLES.—Do you make waffles? If not, why not? Try this, following directions carefully, and you will be pleased with the result: Two cups of sifted flour, one cup of buttermilk, one tablespoon of melted butter, one teaspoon of baking powder, one-half teaspoon each of salt and soda, two or three eggs, beaten separately. Sift the flour, salt and baking powder five or six times. Beat the yolks of the eggs and stir into the buttermilk, sift the flour in a little at a time, beating the mass smooth between times, add the melted butter and beat till perfectly smooth; beat hard and long, for your success depends upon it. Add the soda dissolved in a tablespoonful of warm water, beat some more, then fold in the beaten whites of the eggs. Grease the waffle irons well before you bake the first waffle, and they will not need it again. Have the irons good and hot. Serve each waffle on a warm plate, fresh from the irons, crisp, feathery, melting, and your family will be sure to pronounce them the "best ever."

Aunt Abby's Outdoor School Room.

AUNT ABBY had been taking a regular course in the city school rooms, accompanied by the children's mother, who had taken much pains to point out all the new and wonderful methods of teaching and training the different grades and who emphasized the improvements at every turn, until in duty bound she had to turn homeward. The first school visited was the high school, where Niece Isabel was in the graduating class. The course consisted of a wonderful medley of Latin and Greek, political economy, English literature, etc., but the prevailing at all times, appeared to be graduating topic of conversation among the students dresses, graduating gifts, class pins and photographs, until Aunt Abby wondered where the real study came in.

The next school was Tom's; he attended the grammar grade. Here the common studies had more show, but according to Tom's own version the gymnasium and football were the principal and most attractive features. Tom's light did not shine particularly bright in the class room, but he was quite a hero at sports. Tom's father consoled himself by saying that the boy was building up a good, strong body anyway, and he might get a job as a coal-heaver if his mind failed altogether.

Marjorie, who attended the public school, a tall, delicate girl quite the reverse of Tom, was being pushed and crowded along so fast that she broke down at the end of every school year, while Doris and Stanley, the two youngest, were just ready to leave the kindergarten. Their mother told wonderful tales of their progress, and when Aunt Abby proposed that the three youngest children should go home with her, she at first refused, for fear they would fall behind their class, etc. But their father set up his authority. He agreed with Aunt Abby that Marjorie was in need of a long holiday. It would be the best thing for her to be turned wild out of doors for a whole season, if not a year, and the two younger children could learn all about the country; their Aunt Abby could teach them common sense anyway, "class or no class." So one bright day in May he slipped a well-filled purse into Aunt Abby's hand, kissed the children good-bye, and hurried them off to the train, saying, "I'll give these babies a chance to grow anyway, if they never graduate."

How happy they all were! Even tired, listless Marjorie woke up and laughed and talked as she had not for many a day, while Doris and Stanley were fairly rapturous. Of course, the reaction came to Marjorie the next day; but she seemed quite content to be out in the hammock among the green trees, as Stanley said like a sick bird in its nest, but Aunt Abby knew the nest would not hold her long. As soon as her wings were strong she would want to fly.

The two younger children were allowed to run wild for a week; then Aunt Abby proposed that they open a country school. Marjorie might come or not, as she chose. The children did not favor the plan at first, but it proved so delightful that there was no question about Marjorie's joining. The first lesson was learned out in the old apple orchard under the beautiful canopy of fragrant, blooming trees. They first read and then recited the beautiful poem entitled, "Planting the Apple Tree," by William Cullen Bryant. Then Aunt Abby told them something of the history of the apple trees, gleaned from her scrap-book. "The first fruit trees were brought from England about 1639. These were all planted on Governor's Island, in Boston Harbor, where there were a few pippins. The Mayflower is supposed to have found room in her cargo for nursery plants as well as tables and chests. There is a tradition that when John Winthrop began the settlement of Pequot (New London), in 1646, he distributed a large number of fruit trees to the young planters, while Governor Endicott's orchard at Salem, Mass., is mentioned as early as 1644. By 1650 Mr. Henry Wolcott's apple orchard, in Windsor, Conn., one of the first and largest in the Connecticut Valley, was in bearing, and for 20 years after, he supplied young trees to his neighbors, and made "syder" by the hogshead, which he sold to neighboring towns and colonies for 10 shillings a hoghead. Five hundred hogsheads were made in one year. Pippin and Pearmain apples seemed to be the favorite varieties.

"William Blackstone, the first permanent white settler in Rhode Island, who built his cabin in the Blackstone Valley in what is now the town of Lincoln, set up his library there, and called the place Study Hill. The name clung to it until 1885, when the hill was removed to make way for a cotton mill. On this hill Blackstone planted an orchard, and the trees bore the first sweet apples that ever were in the new world. According to history, Blackstone, riding on a bull, went to Providence occasionally to preach, and often carried a sack of these sweet apples to distribute to the members of his congregation. There is no doubt that these sweet apples were produced on other stock by grafting, and that the apples increased and spread throughout the State of Rhode Island, and into adjoining States."

Of course this history led naturally to a host of questions from the children about the early history of the colonies and the first settlers, while Stanley clamored for Indian stories until Aunt Abby had to start both him and Doris on a journey around the orchard to count the number of trees in a row, the number of rows, etc., and they had an exercise in arithmetic, both mental and physical, which lasted until the tea-bell rang. They all agreed that Aunt Abby's school room was the most delightful one they had ever entered. They had never learned so much about everything at one session, and "I can remember it all without trying," exclaimed Stanley. "The best of it is we have not exhausted the old orchard yet," replied Marjorie. "And that is only a tiny bit of even our own little world," echoed Aunt Abby.

ALICE E. PINNEY.

Starch Beads and Damp.

ON page 1088 A. G. W. has stated her trouble with starch beads and the editor asks for others' experience. I made some beads according to rules that you had published and they appeared hard, pretty and quite a success, until worn during our damp weather of the Massachusetts coast, and then, alas, they were anything but successful. I know of nothing to harden them against the damp weather. They may be satisfactory inland where the air is more dry, but sealing wax or glass will have to be used by people who live near the coast, unless I am mistaken. I should be interested to see what is said on the subject.

H. R. K.

I make starch beads for sale, and have never had trouble with their softening. I have even washed them without trouble. Take one tablespoon of starch, 1½ tablespoons of salt, four tablespoons of water. Boil hard till stiff. Then take one tablespoon of the mixture and roll out in a little salt. Cut even strips with a knife or large needle and form into beads and string. In about one day they will be ready to string if made right. I have made them for a long while and sell them, getting 30 cents for 75 blue, 30 cents for 75 black and 35 cents for 75 pink ones. I don't furnish the small beads to go in between.

E. J.

Pork Spice Cake.—One cup cracklings, ground; one cup molasses; one cup brown sugar; one cup fruit; one-half cup citron; all kinds of spice, ground; one teaspoon soda; one cup boiling water; flavor to taste.

MRS. A. D. H.

Potato Pie.—One cup potatoes mashed fine, one cup sweet milk, one-half cup sugar, two eggs well beaten, butter the size of a walnut. Flavor with nutmeg. Put all through a colander and put in a pie tin which has been lined with a good pie paste and bake. This makes one pie.

MRS. ELLEN KYLE.

Carrot Pudding.—Two cups flour; one cup raisins; one cup grated carrots; two eggs; one cup chopped suet; one cup milk; one teaspoon salt; two teaspoons baking powder; cup sugar; vanilla; boil or steam. Carrots used in the same way as pumpkins for pies are fine.

Live Stock and Dairy

CONCERNING HEAVES OF HORSES.

FARMERS often are at a loss to understand why one horse out of a number fed in exactly the same way contracts heaves (broken wind). If the disease is due to feeding dusty hay one should suppose that all horses so fed would become heavey; but this is not the case. Certain horses evidently are particularly susceptible to heaves. That assuredly is true of the horse with the gluttonous appetite. Think the matter over and it will be conceded that practically all heavey horses have gluttonous appetites and such horses, before the disease attacks them, are the best workers. They come in from work ravenously hungry, gobble up their grain and then stow away all of the hay in sight, and commonly there is far more hay available than any horse should have. Before there is time for sufficient rest, or the partial digestion of feed, the horse is returned to work. His stomach is greatly distended and presses injuriously upon the diaphragm, a muscular tissue separating the lung cavity from the abdominal cavity. The lungs in this way are impeded in their action while the digestive organs are burdened by an oversupply of feed which is not properly digested. Under these circumstances the horse soon contracts chronic indigestion which always is present in heaves and explains the formation of gas, the frequent passage of which, during a coughing spell, is one of the most annoying symptoms of the disease. In a confirmed case it will be noticed that the horse has a coarse, harsh, staring coat of hair and is pot-bellied, hidebound and weak, but retains appetite. We must conclude that the tendency to heaves is hereditary. Gluttonous appetite is temperamental and temperament is hereditary. The horse should not be blamed, however, if heaves is contracted. It may be expected to come on if a horse that has a gluttonous appetite is allowed to stuff himself with coarse, bulky, dusty Timothy or clover hay three times a day and then is made to work when over-distended with such feed. The horse that is a big eater will prove the best worker and most enduring animal if judiciously fed. Allow him not over 1¼ pounds of the best of hay per hundred pounds of body weight as a day's ration and dampen it with water at feeding time. At times when he has to work extra hard do not feed any hay at noon. Give most of the hay at night. If a horse comes in hot and tired and is to be allowed a considerable rest at noon, give him a sip of cold water, then one to two pounds of hay to eat while cooling off, then his drinking water and then his grain feed. So fed a horse will not be likely to contract heaves, and the chance will be less still if he is allowed plenty of time to rest and digest feed at noon and never is made to work when his stomach is distended with feed.

Many experienced horsemen do not regard heaves as being hereditary, but we do not belong to that group, for we have seen many cases where the progeny of heavey mares proved heavey when mature and many cases have been reported of "wind-broken" stallions begetting colts which in time became heavey. These cases may have been merely incidental, but they certainly are so suspicious that one had better avoid breeding from heavey sires and dams. In many States stallions afflicted with pulmonary emphysema (heaves) are not granted licenses for public service.

If a horse is seen to be coming down with heaves hay should be withheld. Feed grass alone in Summer and in Winter prefer wet oat straw to hay. Well-made clover hay is good feed for any horse so long as it is not too freely fed, and it should be wetted at feeding time. Second growth clover hay, or that which has been thrashed, seldom is fit fodder for a horse. Prefer limewater for the wetting of feed for a heavey horse. Do not feed any bulky feed at noon and do not work him soon after a meal. The bowels should be kept active at all times and for that purpose a heavey horse may have as often as necessary, two or three ounces of raw linseed oil in a bran mash. Carrots and parsnips also are good Winter feed for such a horse and many farmers are now successfully feeding silage as a part ration. Moldy or excessively acid silage is absolutely unfit and highly dangerous as a feed for horses.

Fowler's solution of arsenic is the popular remedy for heaves, the dose being one tablespoonful (half an ounce) night and morning. Arsenic is especially beneficial in diseases of the breathing apparatus and for chronic diseases of the skin. It also is much used as a tonic for plumping up a thin horse. When it has done its work it should be very gradually discontinued. If suddenly withheld the horse may "go to pieces," like any drug fiend suddenly deprived of his "dope." Home remedies are many. One of them is to give drinking water made quite blue with washing indigo. Another is to allow the horse to inhale the fumes from a pailful of crude petroleum (Beaumont oil) placed in the manger. There are many more or less effective commercial heave remedies on the market, and they probably contain lobelia leaves and arsenic in combination. The disease when confirmed is incurable, but fed and managed in the way suggested here a heavey horse may be enabled to do enough work to at least pay for his feed.

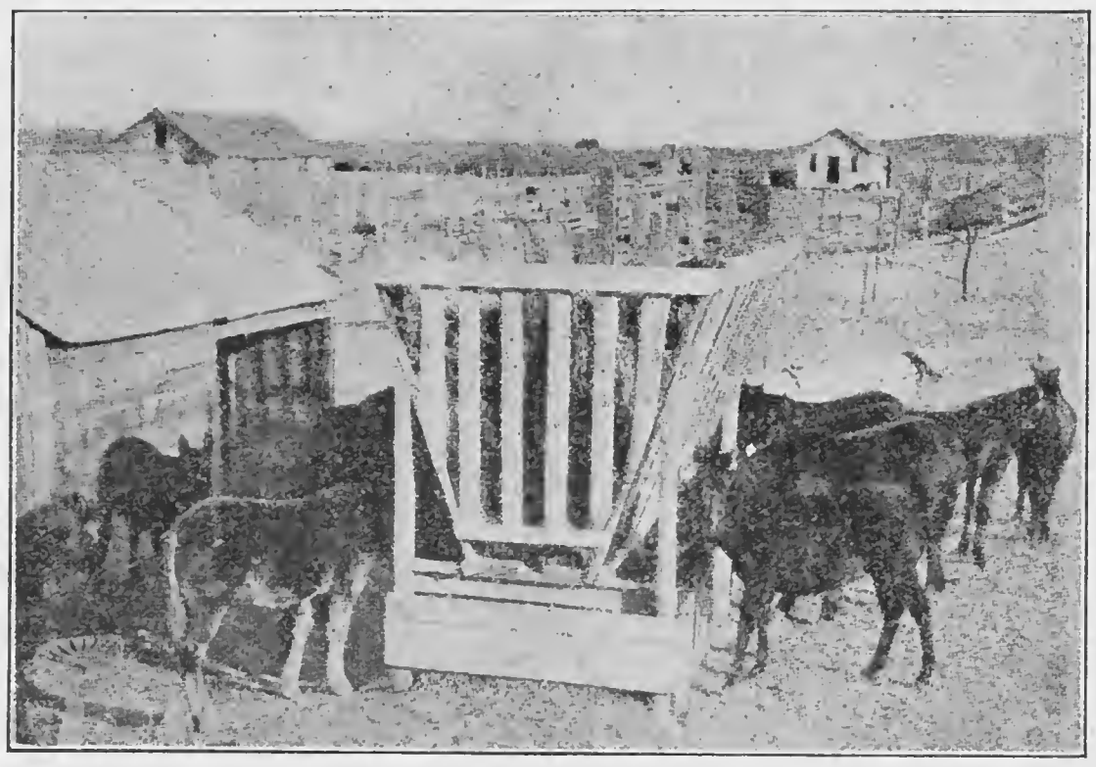
We find that the disease is most likely to attack horses in States where clover thrives luxuriously. It would also seem that it is most common in damp, muggy climates. We have not heard that it is prevalent in mountain States.

A. S. ALEXANDER, M. D. C.

Alfalfa Hay for Horses.

HORSES are maintained more economically, are supplied a balanced ration without bran, suffer no bloating, growing draft colts have seldom been injured by eating too much Alfalfa and oats, and as horse feed good well-colored Alfalfa is equal in value to wheat bran in the horse ration. This is the opinion of the Nebraska Experiment Station which has investigated Alfalfa and other hay for horses. In the experiment six animals did heavy work seven or eight hours daily, and mules consumed half as much Alfalfa as the horses. The mules, working one hour less the day, held their own with the horses, and the cost of feed was two-thirds as much for the mules as for the horses. With Alfalfa, to obtain the best results in pasturing, it is advised that horses should be turned out at night. Six work horses with rations of corn and oats, and a feed of Alfalfa hay at noon, it was observed, stood work equally well with dry-fed horses on adjoining farms. A mixture of eight pounds of Alfalfa and 12 pounds of Brome grass makes a safe pasture for horses and other stock.

For fattening horses, one feeder secured four pounds gain daily on horses by feeding 21 pounds coarse ground corn and 14 pounds Alfalfa daily. Alfalfa meal is being used as a partial substitute for oats in a grain ration, as corn alone is apt to produce digestive troubles. Alfalfa meal adds bulk to this corn, and forms a cheaper feed than bran or other commercial by-products. A charge of $3 the ton for preparing the meal is added to the hay cost, which was $10.50 the ton. One breeder stated that he finds 10 pounds of Alfalfa hay in the dry lot with a little corn fodder or wheat straw makes a splendid feed, and colts do better than when fed the same weight of prairie hay and 10 pounds of corn or oats. It is advised that one pound of Alfalfa or other hay and 1¾ pounds of grain per day for each 100 pounds of the horse's weight makes a good ration for the work animal. Horses like the stems, and refuse from the cattle racks is very acceptable to the horses. Because of the ease with which it can be grown it should form a part of the horse's ration. Bran at $1 per cwt. is not practicable as regular feed with corn at 45 cents and oats at 33⅓ cents. Oats and corn are about equal value for horses, pound for pound. These facts are taken from a recent bulletin issued by the Nebraska Station. The picture given below shows a rack for feeding Alfalfa hay to mules and colts in the yard.



ALFALFA FEEDING RACK USED IN NEBRASKA.

The Brown Swiss Cattle.

CAN you give me any information pertaining to the Brown Swiss and French-Canadian breeds of cattle? Are they essentially dairy breeds, and what are their points of excellence? If there is an association of breeders for each in this country, can you give the addresses?

R. F.

The Brown Swiss Breeders' Association is located at Groton, Conn.; Mr. N. S. Fish is secretary. The Brown Swiss as a breed are plain, substantial, although rather fleshy, and give one the appearance of being somewhat coarse in bone and general make-up. The head and neck especially are large and plain contrasted with the English breeds of cattle. The hind quarters are full and round. The cows have large, well-shaped udders and uniform teats. The cows average about 1,200 pounds in weight, and the bulls 1,600 to 2,000 pounds. The color is brown or mouse-colored. The brown varies from a very light to almost black. The nose, switch, tongue and horn tips are always black. The nose is surrounded by a mealy ring and a light stripe is always found along the top-line. In disposition the breed is especially quiet and docile and easily handled. The breed is slow maturing; cows usually calving at about three years of age. They are noted for continuing to be sure breeders to an advanced age. While in Switzerland the breed is considered dual-purpose, in America the Brown Swiss breeders are developing their breeds strictly as a dairy breed. The majority of the cows can be counted on to average about 6,000 to 7,000 pounds of 4 per cent. milk. No system of advanced registration has been adopted in this country as yet.

The French-Canadian breed is very closely related to the Guernseys and Jerseys. They have become adapted to severe climates and are noted for their vigor and ability to withstand the cold Winters of the North. In size and conformation they are much like the Jerseys; cows averaging about 700 to 900 pounds in weight. They are active and adapted to hilly and rough pasture. In color they are black with an orange stripe down the back, and along the muzzle. In quantity of milk they can be compared favorably with the Jerseys, and the fat content averages 4 per cent. to 5 per cent. The French-Canadian Herd Book was established in Canada in 1886. There is no breeders' organization in the United States.

THE BEST LINIMENT
OR PAIN KILLER FOR THE HUMAN BODY
Gombault's
Caustic Balsam
IT HAS NO EQUAL
For the Human Body — It is penetrating, soothing and healing, and for all Old Sores, Bruises, or Wounds, Felons, Exterior Cancers, Boils Corns and Bunions. CAUSTIC BALSAM has no equal as a Liniment.
We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.
A Perfectly Safe and Reliable Remedy for
Sore Throat
Chest Cold
Backache
Neuralgia
Sprains
Strains
Lumbago
Diphtheria
Sore Lungs
Rheumatism and all Stiff Joints
REMOVES THE SORENESS--STRENGTHENS MUSCLES
Cornhill, Tex.—"One bottle Caustic Balsam did my rheumatism more good than $120.00 paid in doctor's bills." OTTO A. BEYER.
Price $1.50 per bottle. Sold by druggists, or sent by us express prepaid. Write for Booklet R.

Selecting a Flock Breeder.

FIRST I am going to address the man who wishes to buy a good ram to use on grade ewes to produce lambs for market. He wants a ram that will, when mated to his ewes, give him the quickest-growing heaviest lamb of the most quality that his ewes are capable of producing. I say heaviest lamb advisedly, for I have proved to my own satisfaction that pounds pay provided you have quality. Buyers do not discriminate against lambs usually on score of weight unless over 90 to 100 pounds, and lambs capable of greater weights make 90-100 pounds quickest. Thus when you select a ram be sure to buy a lamb if you can. Some may think this queer advice but if "like produces like" then a lamb ought to foretell what sort of lambs he will sire. If you think necessary keep him for a year before you use him, but buy him as a lamb. When you select him look for masculinity as portrayed in the broad nose, the strong sturdy neck, the flashing eye and the desire to hit you a rap. Look for a straight back and broad loins, a good fleece and plenty of bone. Never if you can help it buy a ram that is at all feminine in characteristics. He will be unsatisfactory as a sire. Learn to tell a good lamb in the rough. A fat lamb costs more, and fat hides many defects. Last but not least, do not expect to buy a good sire for less than $12 to $15, as a lamb, and do not expect a show lamb at that price. You will never get it. If you must buy your ram by mail buy from a reliable breeder and tell him what sort of ewes you have, and he will treat you right.

Now for the breeder of purebreds. He already has a high-class flock, but he wishes to raise his standard. He must know just how high his own flock stands, and then buy the very best his pocketbook will allow. He must remember when buying to pick not only for all that the breeder of grades wants, but he must have breed type, pedigree, clean fleece and all the things which it is so hard to find in one sheep. He should, if possible, see the sire and dam of the sheep he buys, and this breeder, like the other, should buy a lamb. Almost everyone wants a yearling, and yet invariably the lambs we sell are the most satisfactory and the most profitable for all concerned. I believe that the purebred man and the grade breeder are in essentials looking for the same thing, but the purebred man has some finer points that are like putting the polish on the rough diamond. Sheep are the most profitable stock on the farm today, and becoming more so, and it behooves the flock owners to buy good rams. H. B.

A. R. O. Record.

WHAT is the meaning of A. R. O. Record of cows, and how should I handle cow to make same? 2. I wish to cut a boar, weight abont 300 pounds. Can it be done and is it risky? New Jersey. J. A. B.

1. The terms "Advanced Register Official" is oftentimes abbreviated "A. R. O.," and signifies that a certain named cow has been put under official test for a stipulated period, and that the record established has been authenticated or made under the supervision of the representative of an experiment station, who is the authorized agent of the Record association that tabulates and recognizes performance achievements. With the Holstein breed they have what is known as the "Seven Day" and the "Thirty Day," as well as the semi-official yearly record. They require a cow to produce a given amount of butterfat or its equivalent in butter, and provided she meet such requirements she is given what is known as an "A. R. O." number. First of all she must be purebred and registered with the Holstein-Friesian Association, and, second, she must produce at least the minimum requirements of the Association as far as milk and butterfat is concerned before she can be admitted. Furthermore, the test must be supervised by an authorized representative of the Breed Association. Some of the seven day or thirty day records have been made where the cows in question have gone dry for a considerable length of time, previous to freshening, and at calving time in very high condition, in fact, notably fat. Of course, they should be given plenty of feed and every other condition for comfort and contentment must be provided. The placing of a cow in the advanced registry is a good means of advertising, for it not only shows performance on the part of the cow herself, but oftentimes, evidences the qualities of a good feeder on the part of the man.

2. A male hog may be emasculated without great risk at this season of the year. The most convenient plan, perhaps, consists in tying the animal firmly by means of a rope aronnd his upper jaw, behind the tusks, fasten this firmly to a post along the side of a fence, and then by means of a gate hold him in a standing position. The operation can be performed while the animal is standing, providing, he is tied in such a way as will prevent his lying down or squatting. A 5% solution of creolin should be used in thoroughly cleansing the wound, which should be low enough and large enough to permit complete drainage.

Purebred Registered **HOLSTEIN CATTLE**

A man in New York State owns two ten-year-old purebred registered Holstein cows that have recently made fine records. In seven days one gave 571 pounds of milk (average fat test of 4.44 per cent.), making 31.6 pounds of butter; in thirty days she gave 2,460.4 pounds of milk (average test 4.21 per cent. fat) making 129.46 pounds of butter. The other made over 29 pounds of butter in seven days and 117.17 pounds in thirty days.

Holstein-Friesian Cows milk earlier, longer, more per year and more per life than any other breed.

Day after Day, Year after Year, **PRODUCTION COUNTS**

It is not what a cow can produce in 7, 14, or 30 days, even in a year that determines her value to the farmer. It is what she can do in a lifetime.

Brown Swiss Cows rank high in average production and are regular and persistent breeders and producers. Year in, year out, they make good records and raise good calves without any coaxing or pampering. If interested, we will send you an illustrated booklet.

The Brown Swiss Cattle Association

IRA INMAN, Secretary BELOIT, WISCONSIN

FEEDING PROBLEMS.

Sorghum as Fodder.

IS sorghum injurious as a feed for horses? Is it likely to cause abortion in cows? What is the feeding value; as compared with corn fodder?

Yates Co., N. Y. J. F. W.

Sweet sorghum is not injurious as a feed for horses in case it is properly cured and fed while in good condition. It very easily deteriorates in feed value, and it is difficult to store the material without danger from mold or decay. It is the moldy and decayed sorghum that is especially injurious as a feed, in fact it is dangerous under certain conditions of storage. It is sorghum that is in a bad condition that may cause abortion when fed to breeding cows, but there would be no danger in feeding it to dairy animals, provided it is well cured and not damaged in any way from storage. As far as its feeding value is concerned it is superior to corn forage for horses and the analysis shows the following content:

Feeding Stuffs.	Water.	Ash.	Carbohydrates.			
			Crude Protein.	Fiber	N-free extract.	Fat
Fresh Green Corn Forage.						
Fodder corn	79.3	1.2	1.8	5.0	12.2	0.5
Sorghum	79.4	1.1	1.3	6.1	11.6	0.5
Dent varieties	79.0	1.2	1.8	5.0	12.0	0.5
Dent, kernels glazed	73.4	1.5	2.0	6.7	15.5	0.9
Flint varieties	79.8	1.1	2.0	4.3	12.1	4.7
Flint, kernels glazed	77.1	1.1	2.7	4.3	14.6	0.8
Sweet varieties	79.1	1.3	1.9	4.4	12.8	0.5
Sweet corn	80.0	1.2	1.4	4.9	12.0	0.5
Corn leaves with husks	66.2	2.9	2.1	8.7	19.0	1.1
Stripped corn stalks	76.1	0.7	0.5	7.3	14.9	0.5
Field Cured Corn Forage.						
Corn stover ears removed	40.5	3.4	3.8	19.7	31.5	1.1
Amber cane forage	41.7	3.0	3.2	17.0	32.2	2.9

F. C. MINKLER.

Cull Apples for Hogs.

I SHALL have several hundred barrels of Baldwin and Greening apples that were damaged by hail and are not marketable. Would it be profitable to put them in the cellar and pay $5 for shotes to feed them to? Cornmeal is worth $1.95; middlings $1.85; dressed hogs 12 cents per pound. How many apples would it do to feed? S.

Maine.

The feeding value of apples is not very high, and the expense of harvesting and storing the apples would have to be taken into consideration. If you can take care of the apples without very great expense, and can provide comfortable quarters for the hogs, it would seem to me that good thrifty shotes at $5 apiece ought to turn a profit. Give them all the apples they will eat, but also give them a slop of equal parts cornmeal and middlings twice a day, what they will eat with a good appetite, but not enough so that they will not eat a good quantity of apples. The pigs will not need much drink aside from the liquid furnished by the apples, just enough to make the meal and middlings palatable. Provide a box of salt and ashes where the pigs can help themselves and if practicable let them run out of doors except in severe weather.

C. L. M.

Grain for Dry Cow.

I HAVE a cow that is due to freshen the middle of October. I stopped milking her two weeks ago and continued to give her the same feed as when I milk her, which was three quarts mixed wheat feed and one quart of cornmeal. Her milk seemed to keep up, and I was told not to feed her any grain, only plenty of grass. I stopped giving her grain for a few days but she seemed always hungry, so I gave her a quart of mixed wheat feed. Pasture is not very good now. Is new hay good for her? G. M.

Rhode Island.

A moderate amount of grain will certainly be beneficial to your cow. However, it is not best to give cornmeal. I would suggest three parts by weight of wheat bran and two of ground wheat feed. A week or 10 days after she freshens add two parts cottonseed meal or oil meal to the mixture. Newly cut hay is not at all injurious to cows. C. L. M.

Balancing Rations.

WILL you give me a balanced ration when cows are on pasture and fed corn from field; stabled and fed Timothy hay, with the following feeds: Corn and oats on the farm to be fed up; beet pulp $32; hominy $32; gluten $33; cottonseed $36; wheat feed $26; middlings $28. G. S. B.

New York.

When cows are on pasture, cottonseed meal two pounds, ground corn and oats two pounds, middlings one pound. This ration will be equally good when cows are being fed green corn fodder. When the cows are stabled, with Timothy hay for roughage, a good grain ration would be cottonseed meal three pounds, beet pulp two pounds, ground corn and oats three pounds, gluten feed one pound, wheat feed one pound. C. L. M.

Comparison of Food Value.

WILL you give a comparison of standard wheat middlings and a stock feed containing cornmeal, hominy, dried brewers' grains, wheat bran, oat hulls, oat middlings, oat shorts, and salt, analyzing protein 10 per cent., fat five per cent., fiber 16 per cent., to be used as a feed for heavy work horses? The stock feed costs $1 per ton more than the middlings. J. H. D.

Rennselaer Co., N. Y.

While the middlings contain more nutrients than the stock feed, they would not make a suitable grain ration for work horses. The stock feed will make the better feed for work horses if either is to be fed alone. A mixture of equal parts middlings and stock feed would be better than either one alone. C. L. M.

LIVE STOCK NOTES.

Cows and Hogs on Same Pasture.

"I HAVE my sows farrow in August and September," says Harry Kuns of Ashtabula County, Ohio. "I have a large farm and considerable pasture. My pasture is fenced hogtight, and I allow my hogs to run in the pasture with my dairy. This can be successfully done, and where there is water one need not give much attention to the pigs, provided woods are in the field. One bunch of little fellows, numbering 15, were sold last Fall for $35. I had not seen them until they were two weeks old. Pigs feed on roots and they work in the low places where the cows seldom visit. Of course I would advise rape, clover, and the cheapest gain I ever put on Spring pigs was by hogging down corn. There are many farms on which brood sows and pigs may be maintained in the same pasture with the cows." W. J.

Salting Silage.

ON page 1046, in H. U. W.'s article, on coöperative silo filling I read: "To prevent the surface of the silage from decaying I soak the corn with a solution of common salt and water almost concentrated. Following this method there is almost no decay." What does he mean by "almost concentrated?" Can you give me the right proportion of each and the amount to be spread over a 12-foot silo? We had two feet of our good feed spoil last year, which we would like to prevent this year. H. A. E.

Fond du Lac, Wis.

What I meant in my recent article by "almost concentrated," is that the liquid used in preserving the surface of the silage is so heavily impregnated with salt that not more than half of it is dissolved. That is, much more salt is used than the water can take up. This is put over the silage until the undissolved portion of the salt is about a third of an inch deep over the surface. W. H. U.

The Brighton cow market near Boston takes place every Wednesday and almost every dairyman buys his cows there; the prices range from $60 to $120 for cows fresh in milk. The market is well supplied every week, but is considered even by shrewd buyers a renewal of a lottery, as the cows are all well bagged up and it is hard to tell what one has bought until the cows have been milked about one week after market day. Of course like everywhere else, the price of grain is getting so high that it will be still harder to make a profit in the dairy business. I am glad to state that this Fall a great many silos are being built, and this will help to solve the question of cheaper milk. At the Fairoaks farm we retail our milk at 10 cents a quart the year around, and we received 60 cents a quart for cream.

Providence, R. I. A. P.

Sept. 21. Milk retails at five and six cents a quart; butter 30 to 40; cattle, about 10, calves 10. Peaches 25 to 60 16-quart basket; onions 40 to 60; melons 25 to 40. Horses high. Hay $22; new hay $12. Potatoes $1.60 barrel, Giants; round stock $2 per barrel. Eggs 33. Severe drought now, grass suffering very much. Corn, 100 pounds $2; wheat $2.20; oats $1.50 per 75 pounds.

Adelphia, N. J. F. L. H.

Sept. 13. This is a dairy section; we have one of the largest coöperative creameries in the State, doing a business of between $200,000 and $300,000 yearly. No market for garden truck nearer than La Crosse—13 miles—so very little truck is raised here. Cattle and hogs are raised very extensively. Few of the cattle are finished for beef here, most of them are sold as feeders. Following were prices Sept. 10: Wheat 90; rye 85; oats 40; corn 60; barley 55 to 60; hogs 8¼ to 8½ cents per pound, live weight; cows 4½; heifers five cents; steers five to seven cents; hay $8 per ton. Butter, creamery, 31; potatoes 60; strawberries in season, $1.25 to $1.50 per 16-quart case; raspberries $2 to $2.25 per 24-quart case; blackberries $1.75 per 24-quart case; currants $1.35 per 16-quart case. Other fruits are raised very sparingly. Apples are very scarce (home-grown). J. B. N.

West Salem, Wis.

BEEKEEPING NOTES.

PREPARING BEES FOR WINTER.—On the proper condition of the bees in the Fall and correct care in preparing them to Winter well, depends the following season's success. Every care should be taken to have the bees in the best possible condition. Bees should have sufficient honey in the Fall to last the colony until honey commences to come in the Spring. Colonies which do not have honey in abundance in the Fall curtail the brood rearing and colonies go into Winter quarters with old bees, which die during the Winter, and leave the colony in a very weak condition. These weak colonies are subject to "Spring dwindling," which soon kills the colony. Bees deficient in stores should be fed early, although it is possible to do this in Winter. Hives having supers on them should have them removed. Colonies are inspected to see if they have a young queen and numerous young bees. If either are lacking the colony should be united with a good colony. Each hive should have 25 to 40 pounds of honey, according to the size of the colony. In some cases this will be a hard thing to determine without going into the hive for an examination. By lifting a few hives, then examining them, a close guess can be made on the quantity of honey in the remaining hives by simply lifting them. This should not be taken as an inflexible rule, as size of hive and strength of the colony will have a bearing on the weight. Hives may be lifted and all those that seem sure of having enough stores need not be examined, but all those that are light and suspiciously light should be examined and amount of stores necessary marked on the hive.

PROVIDING STORES.—The most common and also the best way to furnish stores is to feed sugar syrup. Some bee keepers have extra frames, filled with honey during the honey flow, and these are put in light hives, after removing the empty frames from that hive. This is a good and easy method, but combs given should be of good grade of honey. No dark Fall honey or honey-dew should be given. Sugar syrup is a better food for wintering bees than most honey. Nothing but the best grade of granulated honey should be used. Homemade feeders will answer the purpose. These need be nothing more than pans put inside of an empty super which has been set on top of the hive, to be fed. A large pan is advisable, as the giving of a small amount of feed daily until the deficiency of stores is made up, induces the bees to rear brood and excites them, thus wasting their energy. Chips, shavings or excelsior are put in the pan to prevent bees from drowning. If feeding is done in cold weather the syrup should be made of five pounds of granulated sugar to one quart of water. A teaspoonful of tartaric acid is added to every 20 pounds of sugar which has previously been dissolved. Without the acid the syrup is liable to granulate in the combs. When feeding the shrinkage of the syrup which is 10 to 25 per cent. should be taken into consideration. Feeding is done at sunset and as much is given as the colony will take up in 24 hours. Weak colonies take up the syrup much slower than strong ones. The feeding of the first batch of feed warm and much sweeter is advisable, as it gets the bees started easier and quicker. Feed is more quickly taken up if given warm, as the heat of the syrup warming up the hive arouses the bees from their semi-dormant condition.

MARKETING OF COMB HONEY.—Comb honey at the time it enters the home of the consumer is generally vastly different in appearance from the neat article which left the apiary. The soiled dauby untidy condition in which it arrives at the consumer's table does not induce people to buy freely and often. The grocer dislikes handling it. A better prepared article finds favor with the grocer as well as the consumer, and produces a lively demand at higher prices. There is too large a supply of the commonly prepared honey on the market. Prepare yours for the fancy trade and realize a fancy price for it. The expense is small per pound, and by so doing you may obtain five cents per pound more for your honey. A steady demand can be created by putting up a good article.

METHODS OF PACKING.—Take your nice comb honey and put it up in fancy packages. Wrap your plain or no bee-way sections in a parchment paper that will show off its contents. In the wrapping fold ends of paper to top and bottom of the section and fasten with a label to keep paper in place. This method does not work well with scalloped or bee-way sections. These may be put up in cartons. Cheap or very elaborate cartons may be obtained at bee-supply firms. Some of these cartons have a circular hole in the front to show the honey. Others have a celluloid covering for this hole to keep insects and soil from coming in contact with comb, and still allow the comb to show. These are good, but a neat plain carton is very satisfactory. Your name and address on the carton will help your future sales. Labels used should contain your name and address.

THE SHIPPING CASE.—To deliver to the purchaser use a shipping case. No glass front case is needed. The grocer can put this honey on his counter or showcase without fear that flies, insects or soil will spoil the ready sale of it or that counter or case will be smeary with honey when display is removed. It will make a pretty article to display, and so will not be kept in a case in some out-of-sight place back of the counter. Grocers do not have to wrap it up in selling it. There are no leaky combs or smearing of cases. Honey will present an appetizing appearance and will promote other sales. Most grocers are also pleased with prepared cases in which the combs weigh exactly alike. This can be easily done by weighing each comb on a small scale and packing all 13, 14, 15, 16 and 17-ounce combs in separate cases. Grocers can then quote sections at a definite price, knowing that they all weigh alike. Bee-keepers can sell such cases to grocers as 24-section case of 14 ounce-sections for such a price as he sets on it. No weighing for the grocer, either at the time of buying or that of selling. Honey reaches the consumer in a neat, pleasing package.

AILING ANIMALS.

Balky Horse.

WILL you give some suggestions as to the best management of horse inclined to be balky? W. E. P.

Pennsylvania.

There is no specific cure for a balky horse, and yet there are numbers of popular remedies. If your horse is not a confirmed balker the best treatment would be to work him every day with a quiet well-broken mare or horse. If balking continues better sell the horse to some dealer or breaker who makes a specialty of training such animals. Time on the farm is too precious to waste on such a horse. One good plan when a horse balks is to throw him with side lines, "hog tie" him and let him lie there for a while. A few experiences of that sort may sicken him of balking. Another plan is to pull the head around to the side and the tail around to meet it, then tie the halter rope in a bow knot to the tail. Then drive the horse in a V-circle until he is ready to drop. Many other plans might be mentioned, but they no doubt are well known to you or your neighbors.

A. S. A.

Summer Sore on Colt.

COLT has raw fleshy growth on the inside of the leg. Will you prescribe?

Ohio. W. L. J.

This probably is a "Summer sore," and if so will be found very difficult to remedy. The tendency is for such sores to dry up in Winter, but return the following Summer. A qualified veterinarian would treat it with strong, sloughing caustics, the actual cautery (firing iron) or would cut it out and treat as a common wound. You might try the effects of an application once daily of a solution of half an ounce of picric acid in eight ounces of alcohol. After each application dust the sore with iodoform and cover with absorbent cotton and a bandage.

A. S. A.

Fistulous Sore.

I BOUGHT a horse five weeks ago, shipped here from Kansas. He had a lump about six inches above his nose right in front on his face with a small opening at the side of the lump, which no doubt he got from shipping. When I first had him the opening was running freely. At the present time it is still running, but not quite as freely as at first. I am of the opinion that there is a splinter in it, or else the bone is bruised, as the swelling is larger than it had been. It does not seem to pain him as I can press out the matter and he does not seem to mind it. Would you let me know how to treat it? J. A. W.

Pennsylvania.

We suspect that a tooth has been removed by trephining and that the hole therefore was made by the trephining instrument. In that event it will probably be necessary to trephine again for removal of diseased bone and trephining may be necessary if it was not done before but an accident shattered the bones, or a sliver penetrated them caused disease. All foreign bodies, including the sliver or snag, must come away before healing will take place. Meanwhile syringe out the opening night and morning with a pint or more of solution of one ounce of bicarbonate of soda to the gallon of warm water. A. S. A.

Tumor

I HAVE a mare 14 years old. Last Winter there came a lump on the cord on the side of the neck, close to the shoulder, so that the collar wears against it. It never seemed to bother her until lately the lump has got as big as a teacup, is very hard, but can move it by hand. I thought the cause was due to the stable blanket binding around her neck last Winter. Do you think I can do anything to remove it or stop its growth? I have painted it with iodine.

New Jersey. A. H.

You should have the tumor removed by dissection, and then treat the wound with antiseptics until healed. A skilled surgeon should be employed, as the growth is close to the jugular vein and other important vessels. We do not believe that treatment other than this will do any good. A. S. A.

Sweeny.

I HAVE a horse that has sweeny; have tried different remedies without any good results. Can you give any remedy? Horse is 12 years old and valuable.

Lewis, N. Y. L. R.

Sweeny is an accidental condition and not hereditary. Clip off the hair and massage the wasted parts three times a day, pulling the skin away from the bones each time, so far as that is possible. At night, or in the morning rub the wasted parts with a liniment composed of one ounce each of turpentine and aqua ammonia and six ounces of raw linseed oil. Discontinue the liniment for a few days each time the skin becomes severely irritated. A. S. A.

LIVE STOCK NOTES.

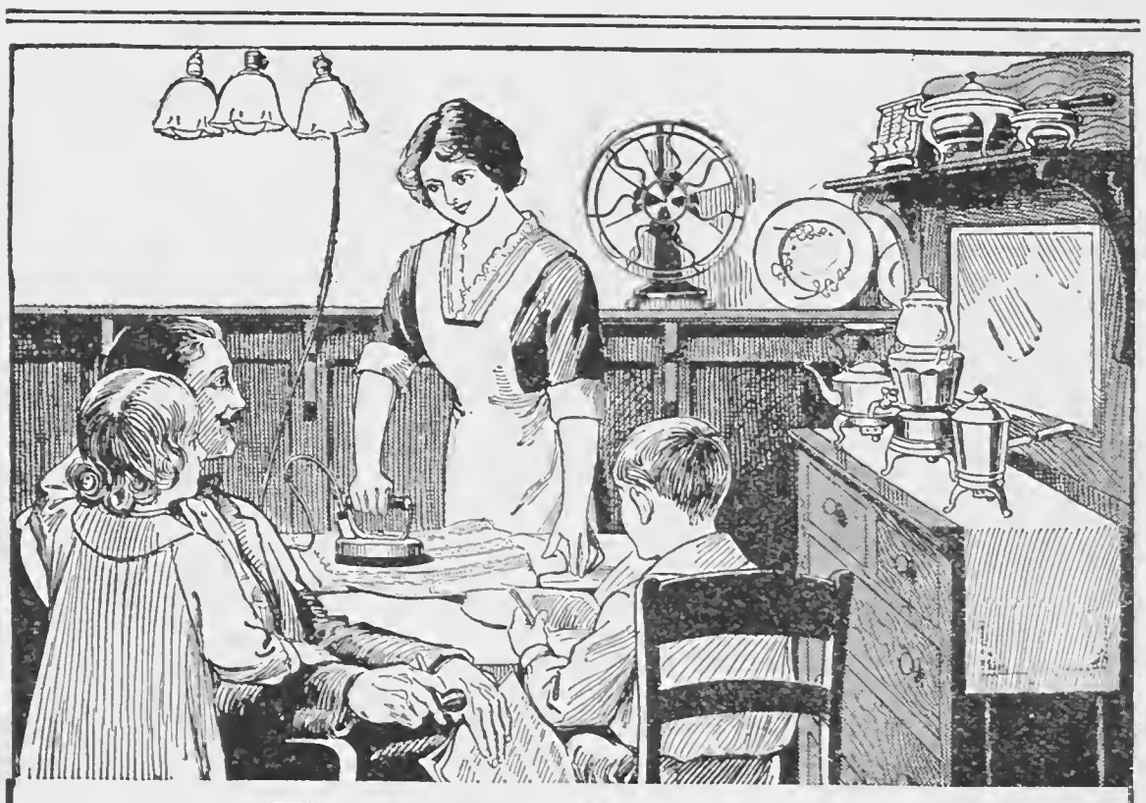
One main thing that stands in the way of profitable sheep raising in New York, New England and other States is the sheep killing dog. In Virginia a recent enactment makes it a misdemeanor punishable with a maximum fine of $50 for an owner to allow dogs to run at large in the country.

Two hundred horses daily were purchased in Kansas City for the allied armies in Europe, according to the Drover's Telegram of that city. They were from 14.3 to 15.3 hands high and weigh from 900 to 1,100 pounds. They must be between five and eight years of age and all colors are accepted except light grays, spotted and dun-colored animals. Better prices were paid than for this class animal last year.

Texas corn should not contain over 10% of moisture, and if it contains as much as 14% it will surely spoil during the Winter. Much of the imported corn has higher moisture content and it spoils unless immediately fed or dried. The station advises careful drying of corn in that State.

"The silo and the smoke house will make Texas prosper," is the suggestion going the rounds in the Lone Star State. The destruction of the cotton market shows the Texas farmer it doesn't pay to put his eggs in one basket. Under the Smith-Lever bill, the Texas College work will be much broader. Visitation, bulletins and correspondence are the avenues through which dairying, live stock raising, coöperation, road construction and home economics will be taught.

An excellent and not expensive fly repellent recommended several years ago in the South follows: One pound common laundry soap, one gallon crude petroleum, four gallons water, and four ounces powdered napthalin. Cut the soap in thin shavings and dissolve it in the water by the aid of heat. Dissolve the napthalin in the crude oil, then mix the two solutions thoroughly, agitating them for fifteen minutes. The mixture should be used once or twice a week, stirred well before using, and applied with a brush.



The Modern Farm-House is a Hive of Industry

And there are countless things to do there that electricity can do best.

It furnishes the ideal light from the standpoint of brilliancy, health, convenience and low cost. Reduces fire dangers.

It saves woman's drudgery by operating her household appliances.

It takes the place of one or more hired men in supplying motive power to farm utensils. **Let it be your one best Christmas gift to the entire family, this year.**

Edison STORAGE Battery

ELECTRIC LIGHT PLANT

The most practical system for supplying electricity for the farm or country home. The Edison battery makes it simple, durable, reliable and economical.

It is the only nickel-iron-alkaline battery without acid or lead plates. Guaranteed to give full rated capacity for four years—and will greatly outlast its guarantee.

Absolutely no battery troubles. Cheap to install and maintain. Needs no looking after.

The Cost of a Heifer.

IT has been figured that the average net cost of raising a yearling dairy heifer on a Wisconsin farm is $39.52. A two-year-old heifer costs $61.41. These figures are probably fair, as they represent the average of 117 calves. Probably these figures will apply to most other dairy districts in the North and East. There are in the United States today over 21,000,000 dairy cows, or about one for each five human beings and this of course shows what an immense sum is required each year to keep up the size of this national herd. The figures for the one year old heifer are given by the Department of Agriculture as follows:—

Feed	$24.67
Labor	4.45
Other costs	6.36
Initial value of calf estimated at	7.04
Total cost at end of one year	$42.52

A credit of $3. is allowed for the manure, which gives the net cost as stated above. For the two year old heifer the following figures are given:—

Initial values	$7.04
Feed	40.83
Labor	7.81
Other costs	13.73
Total	$69.41
Credit for manure	8.00
	$61.41

The most expensive period in the life of the calf is the first four weeks, because during that period, the calves must live almost entirely upon whole milk. One-half of the feed cost for the first year and one-third for the full two years is for whole or skim-milk. The manual labor required in raising a heifer is about 40 hours during the first year and 23 hours for the second year. The total cost of man and horse labor in caring and providing food for the two years is close to $8. The item of other costs would include interest, rent of building and equipment, bedding and a fair share of the expense of the farm business. We believe these figures are substantially correct as given by the Department. It costs about as much to raise a scrub heifer as one that contains a good share of pure blood. A scrub heifer would rarely sell for more than $40, a clear loss of $20 or more. In fact, a heifer has to be good enough to bring $60 when two years of age in order to give an even return for what she has cost. It is true that on some cheap farms, or where there is an abundance of silage, or Alfalfa hay the heifer may be grown for a little less than these figures, but there is no business that could prosper in producing a thing for just about what it cost, and if you produce a heifer at all, and pay out $60 in labor and feed, you ought to produce a good one rather than a scrub.

Composition of a Cow's Cud.

WHAT is the composition of a cow's cud? I know that the pellets formed in the first stomach of the cow tribe, which are afterwards raised and chewed again, are passed into the third stomach to be completely digested in the fourth stomach, but this does not explain *what the composition of a cow's cud is* B. H.

Alabama.

The cow's cud consists of a food partially masticated which has been through the pouch and returned for more thorough mastication, and the only change the food has undergone is that a part of the insoluble starch has been changed to a sugar called maltose. When the food first enters the mouth of the animal it is ground by the teeth, and at the same time moistened with the alkaline saliva. In this condition the food is more easily swallowed. The most important property of the saliva is due to the enzyme petuialin, which it contains. This first enzyme of the digestion converts the insoluble starches of the food into a sugar called maltose. The protein and fat of the food are not changed by the action of the saliva. The food remains in the mouth for a comparatively short time when it is passed on to the stomach. In ruminants or animals which chew the cud, the stomach has expanded into three compartments called the pouch, the honeycomb and the manyplies before the true stomach is reached. They serve him merely for a pouch chest for the storage of food and for better preparing it for digestion. In ruminants the food is swallowed after partial mastication, and passes into the pouch from which it can be returned to the mouth in small portions to be again chewed when it passes on to the true stomach and digestion proper begins.

F. C. M.

Delaware County Conditions.

DELAWARE County farmers are justly indignant regarding articles appearing libelling the county. The dairymen loudly protest against reports branding them as filthy, their barns dark and unsanitary and stating that butter and cheese factories are encouraging these conditions that they may control the milk supply. These facts are not true, and if dairymen anywhere deserve commendation for clean well-lighted, well-ventilated barns, the farmers of Delaware County deserve praise. The Delaware County farmer admits that there are slovenly dairymen here, but there are fewer slovenly dairymen in this county, the number of dairy farmers considered, than in many dairy sections elsewhere. A writer recently declared, "There is a curse on Delaware County," and the farmers insist the author of the article is the curse, and his story is entirely false.

Delaware farmers state that of 90 creameries in operation there is not one which receives milk which would not be accepted in New York city. The butter and cheese produced in the county, the present writer is informed, are from dairies which have passed rigid inspection by competent and sensible men. Two of the large milk concerns, Borden's and Sheffield's, employing a skilled veterinarian, and demanding the most rigid inspection, are operating in the county, and they find the dairymen willing to measure up to their demands in barn equipment, sanitation and maintenance of healthy herds.

One concern which had not been under the direct supervision of the State, owing to sales outside the Empire State, recently came under New York health authorities' supervision in view of shipping milk to the city. The 370 tributary dairies to this concern were inspected, and it was found necessary to make recommendations to but 25 dairymen, and then not for filth, but for insufficient light and air requirements. The demands of the department were satisfied in each instance.

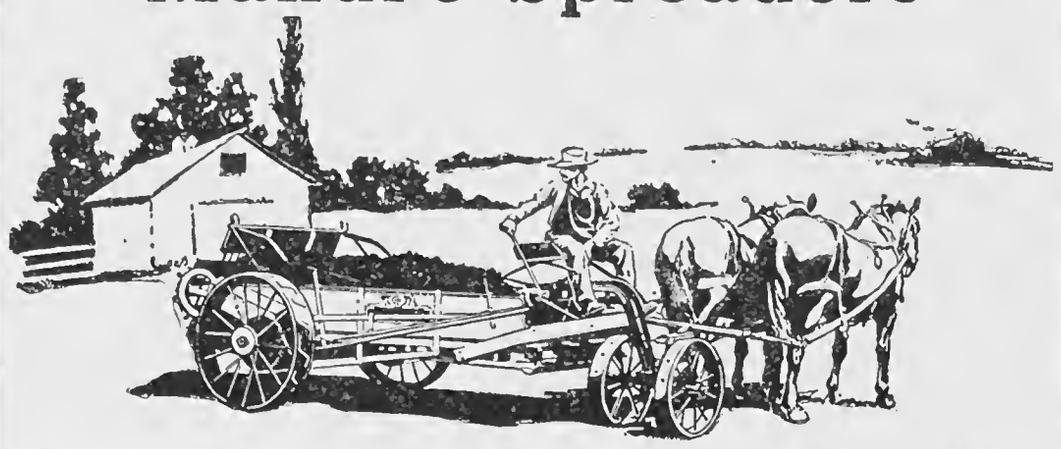
One of the leading dairy papers also takes a gloomy view of the county, and this has aroused protest in the minds of the farmers in Delaware County. The farmers admit there are dairymen who are in the rear of the procession. There are many silos, and there are being more established each year. It is a good hay county; many of the farmers have a large acreage of hay. Where hay has grown as well as in Delaware County, farmers have been slower in establishing silos. Farmers in this county are buying gasoline engines, many own their silo-filling outfits, many automobiles, mechanical milkers and the interest is keen in purebred stock. Jerseys predominate in the county, Holsteins next and there are many Guernseys and Ayrshires. The farmers are forming a breeders' association, open to all, and there is an active Holstein-Friesian breeders' association. The purebred Holstein population is between 3,500 and 4,000 head, and is increasing rapidly. As good dairy blood is to be found in this county as elsewhere, and among the Jerseys there is one farm, the Merridale farm, which has 400 head of purebreds, both excellent imported and American blood. There are many excellent herds of from 50 cows to more than 100. The farmers are learning the value of the purebred sire, and are heading their grades with good blood. Those who have been keeping grades are introducing purebreds in their herds.

Farmers agree there is too much swapping of milk checks for feed bills. This situation cannot be remedied at once, but it is the policy of some farmers to raise as much grain as they can, oats and buckwheat being their principal grain crops. The oat crop was very good this year, many pieces going better than 50 bushels. Buckwheat, some farmers declare, is not as well filled as it might be but quite good. The season has been a little wet. Silo filling was well completed September 20.

There is perhaps only one per cent. of the sheep raised there were a half century ago. A number of farmers are raising hogs; the white breed seems the favorite, the O. I. C. the Chester Whites being the more common.

One farmer stated the price they are receiving is $1.65 for 4.5% milk, and three cents better the point up to 5.3%, and three cents off for every point below that figure, 10 cents better for barn score. There were 16 farmers who recently had bacterial count made of their milk, and it was below the minimum limit prescribed. The farmers have high labor expense, great expense for feed, and the margin to the man who relies on milk production alone is small. The farmer is justified in criticising prices in view of his high cost of production and interest on investment, and his interest in purebred stock is one of the various evidences that he wants to make dairying pay a profit in Delaware County. For July the Bovina Center Coöperative Creamery Co. paid 37½ cents a pound for butterfat; the Andes Creamery Co. paid 34 cents, and the Andes Coöperative Dairy Co. 32½ cents a pound. W. J.

International Harvester Manure Spreaders



WHY are International Harvester manure spreaders so popular? Because:

An I H C spreader is low enough for easy loading, yet it has plenty of clearance underneath. The rear axle is well under the load. Rear wheels have wide rims and Z-shaped lugs, insuring good traction under all conditions. Frame, wheels, and all driving parts are of steel. Apron tension is adjusted by a simple device. Winding of the beater is prevented by large diameter, and beater teeth are strong, square and chisel-pointed.

International manure spreaders are built in several styles and sizes, low or high, endless or return apron, for small farms and large. Repairs, when needed, may always be had promptly of the local dealer.

Examine International spreaders at the dealer's. Write us and we will tell you who sells them, and we will send you interesting catalogues.

AMERICAN STEEL FENCE POST
Made by American Steel & Wire Company
High-class steel, heavily coated with zinc. Strong enough to hold up any wire fence and furnish all necessary resistance. End and corner posts so strong that they will maintain any wire fence made.
Cheaper than Wood and More Durable
Adapted to all conditions and absolutely satisfactory, no matter how heavy the fence nor how hard the usage after the fence is erected. Give better service than wood post, and you get the benefit of every post in the fence from year to year, while wood posts burn, rot and decay from the start. Have been in service since 1898, in every section of the United States, and the oldest posts now as good as when set. Adapted to all fences. Increases the life of a fence. A wire fence on wooden posts is like building a brick house on a wood foundation. For sale by dealers everywhere. Big picture catalog FREE.
American Steel & Wire Co., Chicago, New York
41052

Save Fence Money
Know how to judge a wire fence for yourself. Our book tells you how to do it. Learn why the
No. 9 Empire and Empire, Jr.
are the least expensive fences to buy in the long run. Empire fence is made of *open hearth steel*, big wires, galvanized as a wire fence should be galvanized. Will outlast *any* soft Bessemer steel fence ever made.

FARM NEWS.

ENGLAND, as a hop market, appears good, and a British opinion declares: "Now is the time to capture the American market. It is safe to say that imports from Belgium, Germany and Austria will be non-existent."

Here is a good idea, a farmer in the Middle West suggests. When you do thrash buckwheat build a frame with sides like the sides of a low barn and with an A-shaped roof. Have the building run north and south, and leave the south end open. Direct the blower or stacker on the roof of the straw shed, have as many men as necessary get up and fork the straw this way and that. This makes a very good temporary shed for young stock. A good firm roof and sides and well topped out makes the shed wind-proof and rain-proof.

Hogging down corn is gaining ground everywhere. The system is the short cut from field to feeding pen and no labor between. Less corn is wasted in dry than wet seasons, and but very small percentage in any season. Rye and rape between the rows increase the efficiency of the corn lot.

Movies for the Wisconsin schools will not only visualize history, art, bird lore, and industrial activity, but it will also mean a light in the schoolhouse for the patrons. Over 400,000 slides have been subscribed for by the Wisconsin schools. The slides and films are gratuitous, receiver paying the express one way. He is allowed to keep them three days.

Fifteen hundred farmers are coöperating in Wisconsin in establishing and maintaining a packing plant. In view of the farmer plant being agitated, the commercial one preferred joining forces. The new organization was incorporated for $250,000 and nearly all stock has been placed.

Out in California the university suggests farm advisers, not because they can give advice which has been preached repeatedly by the agricultural press, but that farmers must see, and seeing is believing.

In Oregon the railroads are reported advising against planting apples, regardless of the market which may be developed, since it is said the railroads cannot handle half of them.

Plow the long way, and make your fields longer is pretty sensible advice. Out in Colorado it is figured that 30 seconds are required for turning. Supposing a field is 40x80 rods, and a 12-inch two-way plow is used. The number of furrows lengthwise will be 660, while the number crosswise will be 1,320. There will be twice the number of turnings plowing crosswise than lengthwise. In turning by plowing across the short way 11 hours will be consumed, while plowing the long way only five and one half hours. Figure that in dollars and cents, by plowing the long way, over half a day with man and team is saved.

The Connecticut Agricultural College opened Sept. 22 with its largest enrollment, numbering 232 students. There are 18 enrollments in the home economics department. The college has obtained funds for a farm mechanics building which will enable the department to give a thorough course in this line.

According to the Connecticut Agricultural College, where succession of crops permits Fall plowing, it will be advantageous, as it will destroy many harmful insects. Cutworms, corn ear-worms, May beetles, click beetles (the adults of the wireworms) grasshoppers and army worms will be greatly reduced in numbers by Fall plowing. This operation breaks open the cells in which these insects are transforming, and exposes them to frost and rains. Late Fall plowing is best, but early Fall plowing followed by thorough harrowing is helpful. The practice is recommended particularly this year in view of the number of white grubs, and the fact that the army worm had been very numerous during the past season.

A new department has been organized at the Ohio State University to be known as the Department of Agricultural Engineering. The work given is not altogether new, as it has been presented from another department for some years. The course will be extensive, and treat of agricultural architecture, farm power, drainage and machinery.

The short courses in agriculture offered with the New Jersey Agricultural College at New Brunswick will open November 16, lasting 12 weeks. Courses are dairying and general agriculture, poultry husbandry, fruit growing, and domestic science and art. Tuition is free to residents of the State, and for this course no entrance examination is required.

There are many simple ways of applying the litmus paper to test soil for acidity. The Ohio State University suggests scraping away the soil with a shovel or hoe, then press a sheet of blue litmus paper firmly against the moist earth with shovel, knife or piece of glass. If the soil needs liming it will turn from blue to red in from 10 to 20 minutes. Care should be given the paper when handling it. There is even acid in the skin which will change the paper from blue to red, and this will be noticed where the fingers touch the corners of the paper. Litmus paper may be secured from any drug store, or possibly the local physician has some of it.

DISCUSSING THE MILK SITUATION.

MILK prices seem to be the important topic just now in all parts of the country. In Chicago a low price will prevail if reports are true of $1.78 per hundred pounds. This price, which means 3.8 cents per quart, is worse than Boston milk prices, which we know are bad enough; in fact so bad few, if any, of us can show any profit on cost of production, and unless conditions are much more favorable there in cost of feed, grain, etc., and board of health rules and regulations are more favorable to producers, I do not see how they can produce milk at the price. The directors of the N. E. M. P. A. are united in asking an advance of four cents per can above last Winter's price, and this is certainly none too much to ask, and will not be thought enough by many producers who do not understand the situation and average circumstances of the many consumers who should buy our product, but as many of these are out of work and other necessities of life are high on account of conditions across the water, I believe it is well to be as reasonable as possible in our requests for an advance, and at a more favorable time make our demands and stand by to obtain them. The H. P. Hood Co. have opened their registers on the following prices and conditions, which are a slight advance above last Winter's price, a fraction of a cent I believe per can, and will average 39¼ cents per can for the six months. The price is graded as follows: October, 38; November, 38; December, 41; January, 38; February, 36; March, 34. This price is subject to the producer's living up to the four conditions imposed by the Hood Co., and refer to milk cooling, milk room, stable and ventilation and air space therein, all of which are reasonable and will no doubt be lived up to by nearly all producers selling to this company. The other companies are holding back and playing their usual waiting game, as they have nothing to lose and everything to gain by this policy. Other cities and towns in Massachusetts pay the producers more and sell to the consumer for less than Boston. The only reason I know for this is that the Boston milk companies have a great many salaried officials in their offices, and these have to be paid by the producers and consumers. Yet the milk companies would not admit it, but are always speaking of the heavy expense they are under and not being able to do business and show a profit under any smaller margin.

The tendency of the most successful milk producers of Massachusetts, in most cases is either to retail or wholesale their milk direct to local or city customers, restaurants, hotels and small peddlers, at a good price compared with what the large Boston contractors pay. They work into Guernsey purebreds or grades as fancy or pocketbook will allow, and the exhibit of those cattle at the Framingham cattle show the other day showed how popular and profitable this breed is with Massachusetts farmers. The exhibit of these cattle there, in fact it is a Guernsey show in the main and conducted as such, was the largest and best of any show in the eastern United States and certainly was worth going to see. The combined value of these cattle was supposed to be upwards of $75,000 and consisted of local herds, herds from other parts of this State, and also herds from outside the State as far distant as Pennsylvania. Most of the prizes, and there were many, went to Massachusetts' exhibitors, yet F. G. Thompson of Pennsylvania took away two firsts, one third, one fourth and one trophy. To show that all had mighty good stock, no one exhibitor got any exclusive share of prizes, but nearly or all herds there got several; in fact they seemed to be well divided up, and no one could cry for getting left. But the main lesson learned from the Guernsey exhibit is this: The public who buy milk and pay a good fair price for same want milk as the rule of good quality and color and rich in cream or butterfat. Guernsey milk will meet these requirements and as these cows are large producers if fed well are a profitable herd to keep, and please all concerned, producer and buyer. The leading Massachusetts producers either know or are learning these facts, and intend to follow these lines to profit and success. A. E. P.

BUFFALO MARKETS.

HOME-GROWN white and blue grapes 40 to 45 cents per 20-pound basket, wholesale, with prospect of a big yield if frost does not interfere. Potatoes 65 cents a bushel and "easy" at that. Apples are colored high and so plenty, that there is really no price for them. Farmers are selling a few Greenings at $1 a barrel and paying 40 cents for the barrel, besides cost of picking and marketing, not to mention meeting the demands of the onerous State packing law. At this rate many of the best apples will not be picked. Fall apples are retailing as low as 50 cents a bushel. The canning factories and evaporators in some sections are offering only 12 cents a hundred for windfalls. Peaches are not high, spite of the failure of the local crop, retailing at 65 to 85 cents a third-bushel basket and of good quality. Prunes 25 to 35 cents per basket. Pears are in small supply. Bartletts being quoted at not above $2 per bushel. Clapp and Duchess $4 per barrel. Watermelons were scarce awhile, but are again on sale at usual Summer prices, 40 to 50 cents each by the hundred. Muskmelons are cheap, not over $1 per bushel; the quality is much better than average. The bean crop is light and prices are high, running from $3 for pea to $4.25 for marrow. The supply of green beans is large, prices from 50 cents to $1 a bushel. Other vegetables are in large supply, cabbage, $2 to $2.50 per hundred; celery, 30 to 35 cents per dozen; cucumbers, 50 to 75 cents per bushel; pickles, 15 to 20 cents per 100; egg plant, 60 to 75 cents per bushel; peppers, 90 to $1.10 per bushel; tomatoes, 18 to 22 cents per 18-pound basket; lettuce, 20 to 30 cents per dozen; cauliflower, 50 to 75 cents per basket. Onions are again cheap, being 75 cents per bushel for good home grown. There is not much change in butter, eggs and cheese; butter is not quoted above 33 cents a pound, the retail price being 33 to 36 cents for very best. Cheese is firm at 17 cents wholesale and eggs 35 cents for fancy, wholesale. There has been little recent change in the prices of poultry. Supply is light and market dull. J. W. C.

Disease of Hogs.

I HAVE a large drove of hogs, mostly Yorkshires, have about 75 young pigs from two months to three months old. I have lost several from disease. Some go blind, will eat a little if held at trough, but if left alone can only locate it by sound of other pigs feeding. Some of the last ones taken I gave a dose of tapeworm medicine as soon as I saw they were sick; three of them are improving. These pigs have been fed on ground feed, oats and wheat mixed, wetted with clean creek water; had a clean dry pen and seemed healthy until suddenly stricken. Can you give me any information? E.

Montana.

The disease may be cholera and you should have a graduate veterinarian make an examination and immunize the balance of the herd with serum if cholera is found present. Meanwhile keep the pigs away from the creek and do not use creek water. Such water often carries cholera contagion. While indigestion no doubt is present one worm noted in the intestines would not be a likely cause. Thorn-headed worms (echinorynchus gigas) no doubt are present. They may be killed by giving eight grains of santonin and five grains of calomel, for each hundred pounds of body weight of hog, after starving the animal for at least 12 hours. Give the medicine in a little slop. Divide the pigs into lots of five for treatment. Care must be taken not to exceed the doses prescribed.

NISCO—

"The TROUBLE-PROOF SPREADER"

is the choice of the business farmer who values spreader perfection. It positively will do more and better work in less time than any other machine. It took us 15 years to perfect this mechanical masterpiece which we know to be

100% EFFICIENT

Thoroughly pulverizes the manure, spreads it wider and more evenly than any other spreader. Easy to load, since sides are only 41 inches above ground. Bed is from 3 to 5 inches deeper than any other so-called "low down" spreader. Built for thorough work and lasting service.

FREE Circular in Colors and Descriptive Catalog

Gives reasons why "Nisco" and "New Idea" are the "Best Spreaders on Wheels." Shows why our machines are practically trouble-proof. Settle the spreader question for all times by writing us Today.

New Idea Spreader Co., Box 17 Coldwater, O.

CRUMB'S IMPROVED WARRINER STANCHION

"My barn that was BURNED was fitted with Crumb's Warriner Stanchions. If it had not been for the ease with which these fasteners were opened I should have lost my cows," writes Mr. Everett Gains, Bernardstown, Mass. Booklet Free.

Studebaker

WAGONS BUGGIES HARNESS

Bought his Studebaker when Grant was president

RIGHT after General Grant had been elected, Mr. Thomas North, of Andover, Ohio bought a Studebaker Farm Wagon. He has been using it ever since and this is what he writes to Studebaker:

"I think I have the oldest Studebaker Farm Wagon in this part of Ohio. It was bought in the Spring of 1872 from Mr. Sed Wade, then your agent for Andover.

"For several years it was used on heavy loads and has been in constant use on a farm of 140 acres ever since.

"In the past month I have loaded with coal up to 30 hundred, hauling the same three miles over bad roads.

"My Studebaker has never been to the shop for repairs, and it is good for years yet."

41 YEARS OF SERVICE

—and faithful service too, for you will notice that Mr. North's Studebaker Wagon has never been to the shop for repairs.

It is the way Studebaker Wagons are built that makes them last. Air dried timber and tested iron go into Studebakers and skilled workmen see that they go in right.

We build wagons today just as strong as we built them sixty years ago. And the wagon that lasts longest is the cheapest wagon in the end.

Studebaker Buggies and Harness are also made to last.

Fancy vs. Utility Poultry.

AT the recent meeting of the Connecticut State Poultry Association Judge F. M. Peasley made a strong and sensible speech at the dedication of the new poultry building. The following extract is interesting right now:

"If we judge by the recent past, we can look forward in the development of the poultry industry to a rivalry between two classes of breeding now known as the fancy and the utility. That there is such a rivalry, and that in some quarters it is an unfriendly and bitter rivalry, is to be regretted. From the standpoint of the so-called utility breeder, I can see much of good that has been accomplished by the fancy breeder and more to be accomplished. I seriously doubt if we would have our pure breeds today, if it had not been for the persistent and painstaking, skillful work of the fancy breeder. His work has in the past and will in the future, be the cornerstone for the utility breeder to build upon. The time has come, or is near at hand, when the progressive fancy breeder may be required to resort to the trap-nest to add another quality, that of inherited capacity for egg production, to the other qualities sought to be produced. While I believe that such a quality can be added to a strain or bred into it, or developed out of it, I am not wholly satisfied that such is the case, and that an excess of strength and vitality is not the explanation of the greater egg records made by some of the pens in the different contests; but when this claimed fact of inheritance once becomes permanently established as a fact, if ever it does you will see the names of the country's greatest breeders in the lists of laying contests, where they are now so conspicuous by their absence.

"Nor can the fancy breeders be blamed for not rushing into the laying contests till they have had a reasonable time to try out the question of whether or not the hen can be as truly bred for production as the cow is bred. If the time comes for them to produce by their skillful breeding hens that can lay eggs as well as carry a certain shape and sport fine feathers, I believe that they will produce beauty and utility so combined that the fascination for poultry husbandry will be upon a surer and safer foundation than at the present time. When these fanciers produce the hen of combined beauty and utility, they will offer no excuse that the trapnest produces green shanks or lavender ear lobes or the shape of a duck.

"I believe that there is no reasonable ground for the differences that appear to exist between these two classes of breeders and hope that the time may come when all lines of difference will be eliminated and every breeder will be both a utility and fancy breeder and that these adjectives may be dropped; that the breeder who wins the ribbons for form and feathers will, with birds of the same breeding, be found among the leaders in the egg laying contest."

Persistent Roup.

THREE years ago I bought some young chickens, and turned them loose with my home flock. Before many days I noticed that the new chickens were not looking well and examination showed that they were running at the nostrils and laboring for breath. It soon spread to all my fowls, and I never had such a time. I tried everything imaginable—all kinds of advertised remedies. Nothing ever did any good. Only the younger chickens were attacked, grown fowls never take it. The sick chickens finally recovered after several had died and I thought I was through with the matter. But the next Spring my little chickens had not reached the age of two weeks when I saw that they had it and they nearly all died. Those that finally recovered were always weak and undersized. The next year I moved to another part of town and was careful not to move a coop, box or anything that had been used near my chickens; I took only grown hens, and they showed no signs of the disease. In the Spring I hatched out a lot of chickens and they grew off nicely at first, but I have discovered several half-grown chickens showing the same old trouble in very pronounced type. The nostrils are running a whitish watery fluid, and some in the eyes and mouth, with labored breathing and a general droopy sick appearance. It is not a cold and no use to recommend permanganate of potash for I have almost used it by the pound. If it is roup why do the old birds escape? H. D. L.

Your description of the disease certainly indicates roup, of a particularly persistent type. The immunity of the older fowls may be due to their greater resistance, owing to maturity. The infection of this disease is easily carried from one place and from one flock to another and is frequently very difficult to eradicate. Complete removal of all sources of infection, including fowls that harbor the disease, and thorough disinfection of the premises offer the only hope of stamping out the trouble. In the case of a flock of only ordinary value it would probably be best to dispose of the entire flock and to replace it with fowls from a source known to be free from the disease. No healthy fowls should be placed in quarters formerly occupied by roupy ones, however, until they have been thoroughly disinfected and all utensils used have been sterilized by heat or chemical disinfectants. Cleaned floors, whitewashed walls, utensils cleansed with *boiling* water or a five per cent. solution of carbolic acid and an ample supply of fresh air and sunlight in the buildings together with prompt disposal of all birds that are harboring the germs of the disease offer the only hope of eradicating the trouble when once it has become well seated. M. B. D.

Managing Breeders.

I HAVE 260 White Leghorn yearlings which I intend to use for breeders next Spring. I have 30 cockerels which I intend to mate, changing them twice a week. Would it be advisable to leave the cockerels not in use in same house caged up? Would you leave all stock out all Winter? At present the egg production has dropped off. Would you advise feeding mash now and how long to keep it up? Can permanganate of potash be used in galvanized iron or tin fountains? How often would you give same and how much? F. J. E.
New Jersey.

If your purpose in managing these hens is to fit them for breeders next Spring rather than to force them for the highest egg production previous to that time, they should be given all the range possible and would better not be confined even through the cold weather and the deep snows. I should keep a dry mash constantly before them in hoppers and would feed whole grains in addition, feeding no moist mashes but giving skim-milk if I had it. The rations need not differ from those ordinarily fed to laying hens though meat food of any kind should be fed more sparingly until the hens begin to lay in Winter; the object being not to force early laying but to keep the fowls in first class condition and cause them to begin their second laying season with an abundance of vitality. They are not apt to begin laying any too early, even with the best of feed and care. Ten cockerels would be sufficient for that number of hens and eight would probably do as well. If the flock has their liberty it will be fully as well to allow all the cockerels used to run with the hens all the time, though if closely confined this sometimes results in too much fighting.

Permanganate of potash should be given in earthenware or wooden vessels. It need not be used at all unless the fowls show signs of colds when it is well to add it to their drinking water in the proportion of about one teaspoonful to the quart. Plan to do your hatching before the middle of May; late hatched chicks are pretty sure to start life with deficient vitality and succumb easily to prevailing infections. M. B. D.

Hens With Conjunctivitis.

WHAT causes the red around hens' eyes to enlarge until nearly or quite as wide again as is natural? Sometimes the eyes swell shut, others only enlarge and look inflamed. They seem well, eat well and lay well. H. A. E.
New York.

Hens are subject to inflammation of the lining membrane of the eyes, or conjunctivitis, and this may result from exposure to dampness and cold, to irritating dust or vapors, or to contagion. It would be best to remove affected hens from the flock that it might not spread to others through contact and if it is desired to treat the hens they may have a few drops of the following solution placed in each eye once or twice daily. Boric acid, ten grains; sulphate of zinc, one half grain; water, one ounce. This is conveniently used from an ordinary eye dropper. A mild attack of this trouble would not render the fowls unfit for food, as it is a local inflammation. M. B. D.

AILING ANIMALS.

Slobbering.

WHAT may be done for a horse that slobbers all the time? His teeth and grinders are all right; it is a weakness of the glands, but I don't know what to do for him. He is 12 years old and has been in that condition for three months. E. F. C.
New York.

See that the feed is sound. Molds or irritants in the feed sometimes cause such salivation. Usually, however, a 12-year-old horse affected with the trouble has something the matter with its molar teeth, and if a veterinarian has not made an examination he should do so at once. He may also find the stones (salivary calculi) are present in the salivary duct (Steno's) which discharges into the mouth. On general principles swab out the mouth twice daily with a solution of half an ounce of powdered alum in a quart of soft water. A. S. A.

Cow With Boils.

I HAVE a cow with hard bunches along her hind leg, between her ankle and hock. These bunches suppurate occasionally, but do not disappear. They are as large as hen's eggs, and smaller. What are these bunches, their cause and their cure? M. C.
New York.

Such small abscesses or boils come from infection of a scratch or slight wound, the infection running in the connective tissues under the skin. Swab them with tincture of iodine once daily and open freely when they soften; then continue using the tincture until they heal. In some instances rubbing with citrine ointment daily gives better results with boils that are indolent and obstinate. Keep the cow from wading in filth or standing in stagnant water. A. S. A.

Itching Skin.

SEVERAL months ago I noticed that one of my horses, which is six years old, would bite at himself and try to rub against his stall. This symptom has continued and now the hair has fallen off in spots on his front shoulders and a slight scab rises on the bare spots. The area affected also seems to be spreading backward. The horse is in good condition otherwise, has good appetite and seems to be in good spirits. Until hot weather came on he was fed three quarts of whole corn with his oats each day, but for the last two months has had simply nine quarts of oats a day and hay. What can I do to relieve the trouble? A. D. K.
New York.

Make sure that chicken lice are not causing the irritation. Stop feeding oats for the present and feed lightly on bran and hay. Work or exercise the horse every day. In the feed twice daily mix half an ounce of granular hyposulphite of soda. If the itchiness continues have the horse clipped; then wash itching parts with a 1-100 solution of coal tar dip as often as found necessary. A. S. A

Thriftless Pigs.

WE have two pigs four months old, weighed 20 pounds at six weeks; seem well, eat well, but they do not grow as fast as they should. I feed them red dog meal, about six quarts a day. When they find a bone they chew on it for a long time. We fed the same meal other years and the pigs did well. What is the trouble? J. J. V.

Feed a thick slop of middlings, cornmeal, ground oats (screened) and 10 per cent. of digester tankage. Make it up fresh each time with hot water. Quit tankage if milk is used. Add one ounce of limewater to each quart of slop. The pigs should be allowed free range on grass. It is quite likely that the pigs are infested with worms, so it would be well to dose them for worms, on general principles. After starving the pigs for at least 12 hours divide them into lots of five and in a little slop mix eight grains of santonin and five grains of calomel for each 100 pounds of body weight. Great care must be taken to prevent pigs from taking more than the doses here prescribed. As they eat bones it would be well to allow free access to slaked lime, wood ashes and charcoal. A. S. A.

Garget.

I HAVE a cow that got her teat caught in a barbed wire and made a bad wound. Wound is getting all right, but she held milk so it is caked. What would you advise doing for it?
New Jersey. E. V. B.

Milk that quarter four times a day, massaging the part each time and at night rub in a mixture of one part of mercurial ointment and two parts of lanolin or lard. It may not be possible to save the quarter now, but the treatment here advised succeeds when the case has not gone too far. A. S. A.

Lameness.

A FEW weeks since I purchased a horse, age about 12 years, weight about 1100 pounds, a very good roadster and a good pulling horse, bought for "sound, except might interfere a little behind and take a few lame steps when first starting." I find the horse does not interfere, but has a weakness in right hind ankle, which does not swell at all even when standing several days in stall, nor does he favor it any when walking or pulling. When he first starts to trot he will favor that right hind ankle considerably for one-half or three-quarter mile, and then he will go sound for remainder of the distance. I am told, on good authority, no spavin exists. I think no doubt it is in the ankle and is a strain or wrench. I do not wish to blister the ankle if I can help it, but would like to know if you can tell me some potent liniment I can make to cure that weakness in that ankle, or in the cords of the ankle? G. H. W.
Maine.

The symptoms point to the hock joint as the seat of lameness, and if so a spavin no doubt is present. It may be a hidden (occult) spavin, among the small bones of the joint. To determine whether the hock of the leg is the seat of the lameness have the horse led out to halter and tell the attendant to trot him instantly when you give the word of command. Pick up the foot of the lame leg and hold it as close to the abdomen of the horse as possible, so as to close the hock joint tightly. Hold it that way for two minutes or so; then drop it and have the horse trotted. If it is hock lameness he will go excessively lame for a few yards; much lamer than before. If it is a spavin we should advise having the joint fired and blistered by a qualified veterinarian, when the weather becomes cool, the horse to be tied up short in his stall for six weeks after the operation. Liniment will do no good. A. S. A.

TOM BARRON AND THE WAR

I am still shipping weekly my Champion Layers—White Leghorns and White Wyandottes, Guaranteed Sisters and Brothers to the pens that are leading the competitions of the world. These birds have 20 years of breeding behind them of the heaviest-laying poultry the world has ever known. Every male has a 200-egg pedigree for many generations. I consider the right male bird increases the egg-laying of the progeny by 50%. Avoid the rough Atlantic weather. Order now. Pay by draft or postal money order on London, England.

PRICES—Carriage and insurance paid, coop and food free, to New York. Trio—$30; 6 birds, $55; 12 birds, $90; 24 birds, $168. Larger numbers at special reduced rates. My White Wyandottes in the competitions for sale. Write now to

THE EGG-LAYING CONTEST.

THERE was a loss of 70 eggs in the total production in this, the forty-seventh week, as compared with the previous week. Molting is in full progress; 180 are marked "M" on this week's report, which signifies that that bird is molting. A larger proportion of the White Leghorns are molting than of the other breeds. Of the 40 Barred Rocks not one is molting, and of the 70 White P. Rocks only two are marked as molting. In the 33 pens of White Leghorns, not a single pen but shows one or more birds molting. The highest number laid this week is 45, by Frank L. Tuttle's pen of Barred Rocks. A. B. Brundage's S. C. Reds keep up their good work and stand second for the week with a score of 41. Tom Barron's White Leghorns tie with his White Wyandottes, and with Fred H. Benton's White P. Rocks, for third place, each pen laying 39. In the totals Francis F. Lincoln's White Leghorns lead the next highest pen by 16 eggs; they laid 34 this week and the prospect is good for the Yankee pen to win. Their total is 1977, the "sour milk pen of Leghorns from Storrs Agricultural Station has laid 1961, and Tom Barron's White Wyandottes 1929. Barron's White Leghorns got too far behind on the start to catch up now; their total is 1895. The only pen in the contest which did not lay an egg was the Heneta Bone Co.'s pen of White Leghorns. This is an experimental pen which has been fed Heneta Mash and Sueculenta tablets; no green food or grain. Their total output is 551 eggs to date. Cutting out this pen, the other 32 pens of White Leghorns have averaged almost 1500 eggs per pen; 1499.78 to be exact. The week's record follows:

	Week	Total

GEO. A. COSGROVE.

Chicks Not True to Type.

LAST June I sent to a well-known breeder and bought a setting of eggs which hatched out four chickens which looked and feathered out just like a White Rock or Wyandotte, but are supposed to be purebred White Leghorns. What is the cause of this? Would you advise breeding from these or not? Should I be liable to a fine for selling these for purebred stock? F. W.
New York.

You will probably be able to tell with certainty after a few weeks more whether these chicks are Leghorns or not. If they prove to be anything else, it will be evident that some one has made a mistake, as Leghorn eggs can hatch only Leghorn chicks. There is a possibility, of course, of an accidental cross with some other breed, but if this has been made it will be evident when your chicks get a little older. The breeder of whom you purchased the eggs should make good any mistake on his part and if your chicks prove to be anything but purebred you cannot, of course, sell their eggs as those of purebred stock. Whether you should use these chicks for breeders or not will depend upon what they prove to be and whether you wish to raise only purebreds; purebreds can come only from purebreds.
M. B. D.

Aspergillosis.

A COCK past one year old for some time seemed to be ailing. At times there was a rattling sound in his throat. Sometimes he seemed to choke and gasp for breath. He became weak and lost flesh. I had him killed. An examination revealed the fact that he had lice in great numbers. The internal organs seemed to be normal except one lung. Over and about this was a substance in color like fat but in consistency more like hard boiled yolk of egg. What was the matter and would it be harmful for chickens to eat the meat of such a fowl either raw or cooked? B. M.
New York.

Certain molds, or fungi, sometimes found upon musty straw or grain may find their way into the air passages of fowls and developing there cause obstruction to breathing and, finally, lead to emaciation and death. After death yellowish tubercles, or masses, may be found in the internal organs where these fungi have lodged and developed. These fungi belong to the genus Aspergillus and the disease caused by them is known as aspergillosis. It seems to attack only certain fowls, probably only those that are in some way unable to resist the infection and there is no satisfactory treatment when the disese has become established. Cooking would destroy these fungi and make the flesh of their hosts harmless as food. M. B. D.

Guinea Hen Not Laying.

CAN any one tell me why my Guinea hen does not lay any eggs this Summer? She has just laid one egg this season. She seems healthy, eats well. I keep them with my hens and they have a run about 50x50 feet and only about 40 hens in it, but I have not let them outside of it this year. Last year they ran all over the farm. Do you think keeping them yarded up would make any difference with their laying? They eat with the hens. Is there any other breed of Guineas except the Pearl and White or African? I have some I bought last year that I should call Pearl Guineas; they are gray, a little the color of a Plymouth Rock hen. I read in a farm paper of a breed called Gray Guineas and did not know but mine might be that breed instead of the Pearl. Mine are just like those one usually sees on a farm where they keep a pair or so and don't make a business of selling them. I. E. B.
Cattaraugus Co., N. Y.

The confinement to a yard is probably the cause of failure to lay, although I have known Guinea hens to lay as well in a small yard as outside. They are not very far removed from the wild birds and like to wander. There are three varieties of Guinea fowl in the country outside of parks and collections of wild birds: the Pearl, the most common, with bluish gray plumage covered with numerous round, white spots; the Lavender, with very pale plumage and similar spots; and the White. They are all native to Africa and are probably only varieties of one species. If your birds are the common kind there would be no indiscretion in advertising them as Pearl Guineas. I have never heard of Grey Guineas. They are probably the Pearl. W. H. H.

Bumblefoot.

I HAVE a strange malady among my fowls; the rooster was affected first, then two hens. There is a swelling on the foot at the junction of the toes; it seems to pain them some, and they walk lame. It looks like bumblefoot. How should it be treated? E. T.
Connecticut.

This is bumblefoot, or inflammation of the deeper structures of the foot accompanied in severe cases with pus formation. It is caused by infection through some break in the skin of the foot such as is easily made by the vigorous scratching of the fowls or by jumping from a considerable height to hard floors. The fowls should be placed on soft clean litter or upon the ground and if the swelling does not subside but becomes soft, showing the presence of pus, it may be freely opened with a sharp blade and the wound syringed out with peroxide of hydrogen; after which it may be dressed with carbolized vaseline and allowed to heal.
M. B. D.

Ailing Fowls.

SOME of my young White Leghorns have been affected with warts around the mouth and eyes, some have one wart only, while others have two. They usually last from two weeks to a month. When they break, some matter appears. If this is the chickenpox, is it contagious to humans? I have not been able to isolate the affected ones; is it necessary? A couple of others are suffering with breathing trouble; these I have isolated for fear it might be the gapes, told me to be very contagious. Their breathing is very noisy, and their combs are turning blue, indicating pressure in their heads. Do you think there might be danger of tubereular affection, if this is the gapes? The fowls are coughing and gasping for breath. H. P.
Florida.

This eruption is very likely that of chickenpox and is not dangerous to humans; the affected fowls should be isolated, however, as the disease is very contagious in the flock and in severe forms is frequently fatal. The sores may be painted with tincture of iodine and the quarters of the fowls disinfected by whitewashing while utensils are cleaned with boiling water. In some cases this eruption may appear in the mouth and nostrils and by the inflammation caused affect the breathing. The noisy breathing of the other fowls may also be caused by catarrhal inflammation of the membranes lining the respiratory organs. Such "colds" are common in the damp weather of Fall and Winter. There is no indication in these symptoms of tubercular infection. M. B. D.

A GREAT TURKEY.—I have a Bronze turkey that laid during the year 1913 141 eggs in one nest. She commenced in March and wanted to sit in September. In 1914 she has laid 104 eggs. She has laid in three nests this year, and wanted to sit twice. As it is only the 10th of August she still has time to beat her record of last year.
Oregon. S. M. KELSO.

Toulouse and African Geese—HUSE FARM Manchester, N. H.

SINGLE COMB WHITE LEGHORN COCKERELS AND YEARLING HENS. Heaviest laying. Blue ribbon stock at reduced prices. JAMES H. OWEN, R.F.D. No. 4, Newburgh, New York

WANTED—100 Pullets—Will take in lots of 10 up. E. M. WILSON, 380 May St., Worcester, Mass.

TOM BARRON'S MAY HATCHED
Single Comb White Leghorn Cockerels
from 220 trap-nested Hens. All birds guaranteed. Price, $1.50 each; 2 for $2.50. Address, W. Oney, Folsom, N.J.

Pedigreed Barron COCKERELS
Sire's mother laid 258 Eggs; Grandsire's mother, 248. Raised nearly 600 chix from this male this season. $2 and $3. H. B. COOK, Orange, Conn.

DUCK DOLLARS Tiffany's Superior Mammoth Pekin and Giant Rouen
Ducks are bred to lay, weigh and win. Stock for sale. Write for prices. F. A. TIFFANY, R. 3, Phoenixville, Pa.

INDIAN RUNNER DRAKES FOR SALE—Valentine strain, April hatched. Price, for one, $1.50; two, $2.75; three, $4; four, $5.25. ROBERT TWEDDLE, Montgomery, N.Y.

Indian Bead Work

NOTHING is more fascinating or more in vogue at this time than **Indian Bead Work articles.** We have procured an outfit for making these articles, which will be sent, delivery charges prepaid, for

ONE NEW YEARLY SUBSCRIPTION
OR
THREE YEARLY RENEWAL SUBSCRIPTIONS
(One of these may be the renewal of your own subscription for one year.)

This outfit consists of a Patented Loom for making articles, an instruction and design book, a spool of cotton, twelve H. Milward Sons' needles, seven bottles of colored beads—dark blue, green, light blue, black, red, yellow and white—a complete outfit to start the work.

Every woman knows and appreciates the value of these home-made articles.

Your neighbor needs *The Rural New-Yorker.* If he is not a reader get his subscription. If he is a subscriber get his renewal.

These articles will not be given with subscriptions—they are sent as rewards only (in place of cash) to our subscribers and friends who, acting as agents, send us subscriptions as indicated.

THE RURAL NEW-YORKER, 333 W. 30th St., NEW YORK CITY

PUBLISHER'S DESK

I would like to become a member of Dr. Ulman's Anti-Fake Club. I think I have enough of contempt for the fraudulent advertiser to keep him out of my home, and enough of business judgment to know that the paper that carries such advertisements cannot thrive in the future as in the past. I believe the people of this country are beginning to learn.

Pennsylvania. J. D. M.

You might write for a week and fill a volume on the subject; and yet say no more than is expressed in the above few lines. This spirit and purpose is broader and bigger than any club can be. The club can only crystallize the spirit; and lead the way that 95 per cent. of the people of this country wish to go. It is not so much to protect oneself individually as to protect the people collectively. Neither is it for our generation alone, but to make dishonesty and deceit unpopular for the benefit of generations to follow us. It is not alone to drive out falsehood and to confuse rogues; but to magnify truth, and to increase our appreciation of the dignity and nobility of honest men.

In THE R. N.-Y.'s article on the "Land Bank of the State of New York," you write "Mortgage banks to be controlled by bankers and capitalists have been proposed to finance farm mortgages. We bid farmers to have a warning of them. If organized at all such banks will exist for the purpose of making dividends." Will you permit me to express my hearty approval of these words and your sound "economy." Over in England my brother-in-law is a director in several land companies, having a pseudo-philanthropic interest in the laying out and erection of workingmen's dwellings on the rent of which these *gentlemen* encompanied are careful to levy their little perquisite for dividends. It will take a long time yet for the average man to learn that it is foolish to pay another person to do what one can and ought to do for one's self.

Massachusetts. F. W. B.

It is encouraging to know that a citizen of Massachusetts appreciates the provisions of the New York State system for financing farm mortgages. This correspondent has the key to the situation. Do not pay another to do for you what you can do for yourself. In this reference it means do not pay a banker, broker, agent, lawyer, or money lender a fat fee, commission or profit to secure a mortgage for your property. It is true that heretofore farmers had to do this because they needed the money. In some cases they had to have it; and there was no other way to get it. Now there is a way. Every community in the State ought to have a Local Land Bank or what is the same thing, a saving and loan association. Other States are trying to adopt mortgage credit systems. So far all of them have proceeded on the capitalistic plan. Through the sympathetic interest of Governor Glynn, New York State has been able to overcome the scruples of capitalists and has secured the only purely coöperative system in the States. In it the capitalist may buy the securities on the same terms as the poorest investor; but he has no opportunity to manipulate them. The management is reserved to the members. No outsider can demand a tribute. There is no other system yet devised by which the borrower may sell his credit on an open market at rates solely dependent on the current rate for many and the merit of the risk.

In a recent issue you had a reference to the case of True S. James against D. B. Cornell, the real estate agent, which may leave a false impression of the true situation in this case. The facts are that Mr. James alleges that Cornell secured a five hundred dollar mortgage on his farm through fraud. Mr. James refused to pay interest on the mortgage, and Cornell thereupon assigned it to a third party, one of his own agents, and proceeded to foreclose. Up to this point Mr. James was willing to leave the decision to the civil courts, but this subterfuge led to the arrest of Cornell. Before the hearing Mr. Cornell agreed to drop the foreclosure proceeding and with this stipulation Mr. James was willing to drop the criminal proceeding, being entirely confident of his facts in the civil courts when tried on their merits between himself and Cornell, without the intervention of a supposedly innocent third party.

New York. FARMER.

It seems that this case was not decided as we supposed on the theory that it belonged to the civil courts; but by an agreement between counsels on both sides that both proceedings be withdrawn, until the superior court pass on the civil case before it. This case before the superior court is an appeal from a decision in the local courts, which was decided against Cornell. Mr. James in this case is doing a service to the farmers of the whole country. It is well to have some one contest in the courts the legality of methods pursued by some real estate agents in the sale of farm properties.

The Amalgamated Oil Company of Oklahoma City, Okla., is franker than some of the promoters with similar schemes. They want to sell stock at one cent a share; but when asked for a statement of assets, reply that t is not necessary for a company to have any assets to sell stock. They say they sold stock even before they had so much as a lease, but say when the stock is sold it becomes an asset to the company. That is news to us. We have always thought that stock is a liability of a company. They claim that they have sold as much as 273,800 shares in a day. That would mean an income for that day of $2,738. We do not much doubt the statement. People do part with their money easily when some promoter promises big profits, but if this promoter keeps on writing letters, it is hard to believe that anyone with ordinary human intelligence will give him even a penny for shares in a company that has no tangible assets.

I never have to hunt all through the pages of modern publications to find the address of the publisher that I do not curse the modern publisher for not putting it on the outside cover, as though he had some intelligence. He is like the veterinarian; never can learn modern ways of doing things. J. G.

Pennsylvania.

This critic cannot mean to include THE R. N.-Y. in his criticism, because the name and address are both on the first page of the paper. But no one need lose time or patience looking for the address of THE R. N.-Y. If you write the name of the paper on the envelope and mail it under a two-cent stamp anywhere in the States, and I venture to say, anywhere in the world, it will find its way to us. As a matter of fact this has already happened.

I am a subscriber and need a little information. Can you help me locate a person named Morris Garfinkel, whose address was 821 E. 161 Street, New York. He comes up to Centreville each Summer and peddles souvenirs, and has been buying some from me each year. He came this Summer as usual and bought something over $75 worth and has failed to pay me. Can you help me?

New York. F. W.

We could not locate Mr. Garfinkel and our attorney was equally unsuccessful. These itinerant peddlers are peripatetic in their nature, and it is unwise to allow them credit to any extent. We print this record as a warning.

Inclosed find some "dope" sent me without solicitation. It does not look good to me. If they do not catch a sucker with one trick, they would catch him with two.

READER.

The literature comes from the International Liberty Union of the World, Covington, Ky. It includes agency for stockings, cheap clothes, portraits, hair restorers, tobacco habit cure and patent medicines, together with subscription to a journal, insurance, a free watch and compass, and dear knows what else, all for 10 cents. No wonder our correspondent calls it "dope." It is about the hottest specimen of hot air that has wafted our way for some time. We recommend the literature as a first aid to fire making.

J. J. D.

WHEN you write advertisers mention THE R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page.

Why We Buy "4130"

To be successful we retailers must above all else consider *your needs*, *your taste*, the *real value* that you get from what you buy of us.

No argument, no tempting profits could induce us to buy clothing unless we felt sure it would satisfy you in fabric, style, fit, comfort and long wear.

It is easier for us to know this about No. 4130 Clothcraft Blue Serge Special than almost anything else you will see in the store.

"4130" is guaranteed pure wool—we know it has the stuff in it to make it keep its shape and outwear two suits of cheaper fabric (often at higher price).

Then, too, it's made in the Clothcraft Shops where every little operation has been studied and improved, where thousands of dollars are saved, and put back into better design, better fabrics, better workmanship. But it costs you only $18.50.

Drop in at the Clothcraft Store. Whether you buy or not we'll be glad to see you and show you not only "4130" but many other pleasing Clothcraft Suits and Overcoats from $10 to $22.

We also carry a Spring weight Clothcraft Blue Serge Special at $15, known as No. 5130.

The Clothcraft Store

(in your town)

Write to The Joseph & Feiss Co., 635 St. Clair Ave., Cleveland, Ohio, for their new Style Book, a sample of the all-wool fabric used in Clothcraft "4130" and a personal note of introduction to the Clothcraft Store nearest you.

February	1.95
March	1.90

Wholesale prices paid by New York dealers are running $1.81 and $1.61 for B and C. Hotels and restaurants using two to three cans per day are paying five to 5½ cents per quart, single quart prices from bakeries and grocery stores, six to seven cents; delivered milk, nine to 10 cents.

BUTTER.

The market is decidedly dull, as receipts are in excess of present needs, and buyers not stocking up. No change in price is noted except on some medium and under grades. The N. Y. Mercantile Exchange has adopted new butter rules in effect October 1. The classification will be: Creamery; Process, made by melting, clarifying, churning again, etc.; Ladles, butter that is collected and worked over by dealer or shipper; Packing Stock, butter as originally made at the farm in rolls, lumps, etc.; Grease Butter, which speaks for itself without description. The grades of Creamery, Process and Ladles will be: Extras, Firsts, Seconds and Thirds. Packing Stock will be No. 1, No. 2, No. 3. The score for Creamery will be on this scale: Flavor, 45; body, 25; color, 15; salt, 10; style, 5. Extra may score 91 to 93 points, depending on season and average quality of the best offerings. Butter scoring higher than the requirement for Extras may be branded accordingly on the demand of seller or buyer. In minimum scores, Firsts may be four points below Extras; Seconds, five below minimum of Firsts; and Thirds, seven below minimum of seconds.

FRESH FRUITS.

The surplus of low grade apples has been disposed of, and, with weather cooler, the tone of the market is improved, although prices remain practically the same. Peaches are getting scarce, choice late varieties like Morris White bringing $1 per basket. Pears of standard varieties are bringing high prices.

VEGETABLES.

The potato market has been in poor condition during the week, with more or less damage in the bulk shipments, which had been on the road during the recent hot weather. Some Long Island and Jersey round have sold up to $2 per barrel, but $1.75 has been nearer an average of sales. Onion market very dull. Cabbage in moderate supply. A few tomatoes bringing $1.25 per bushel.

HAY AND STRAW.

The heavy accumulation of hay at terminal points has been lowered a trifle, but there is still considerable surplus and a large amount of heated stock, caused by baling too early. A decline of 50 cents per ton from last week's prices cover most business in medium and under grades. Straw prices unchanged.

Apples in Bulk.

I would like to know the name of a concern in New York that will handle bulk apples. L. W.
New York.

The name of a dealer of this class, has been sent the inquirer, but the price for apples shipped in this way is likely to be low. They will be badly bruised in the two handlings and shaking up they will get on the way, and will appeal to a class of cheap trade known to the dealers as "snakes." In our judgment there will be more profit in barreling those that are worth selling and using the remainder for vinegar, stock or live stock feed. Apples in bulk are often seen in peddlers wagons in various parts of New York, but most of these were shipped in baskets or barrels and poured carefully into the wagon box after buying, as they make a better show in this way. Dozens of these wagons may be seen every business morning in the wholesale districts, loading up with whatever kind of produce is cheapest.

What apples are raised here are sold in local market. No. 1 Gravensteins are retailing at $1.75 per barrel. Apples are plenty, and the wholesale men are not buying. Winter apples are not yet on the market. It is predicted that the Winter fruit will be sold for $1.25 a barrel. Since the men here do not ship their apples it is doubtful if many know what the apple law is. A. B. H.
Bangor, Me.

"I HEAR the sea captain is in hard luck. He married a girl and she ran away from him." "Yes; he took her for a mate, but she was a skipper."—London Tit-Bits.

FARMERS SECURITY BUREAU } Superintendents, Working Foreman, Gardeners, Dairymen, Herdsmen, Farmers, Milkers, Couples, Teamsters, Farmhands, Laborers. Sidney Sullivan, Expert Agency, 99 Nassau St., N. Y. 6486 Cortland. Classed by itself.

Subscribers' Exchange

ALFALFA HAY—F. P. ERKENBECK, Fayetteville, N. Y.

WILL EXCHANGE White Potatoes for Sweets. Write C. T. STONE, De Ruyter, N. Y.

NEW HONEY—Basswood or clover in sixty-pound cans. Write for prices. C. A. HATCH, Richland Center, Wis.

FOR SALE—Fine team gray horses, 5 years old, weight, 3,000 lbs., well seasoned and suitable for any kind of heavy work. Address FARMER, care Rural New-Yorker.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

WANTED—A reliable farm hand for general farm work. MAX G. ELDER, Pattersonville, N. Y.

WANTED—Work on farm; married man, wife, one child; understands all kinds of farm work. K. H., care Rural New-Yorker.

AGRICULTURAL COLLEGE MAN desires position as worker-manager, renovation or poultry specialties. PHILIP MARSH, Farmington, Me.

WANTED—30 apple pickers, graders and packers. High-grade fruit, boxes and barrels. Board on the place. J. H. HALE, Seymour, Conn.

BY MARRIED MAN—Life experience in all branches of farming; milker and teamster, wants steady work. EMIL LAUBLE, Arlington, N. Y.

UNMARRIED MAN—Farm reared, now employed, desires poultry farm work, where character is appreciated. Address X, care Rural New-Yorker.

WANTED—Position as working foreman on gentleman's farm, life experience, married, no family, with cottage, or wife do housework, knowledge of fruit and gardening, good habits, no liquor. G. M., care R. N.-Y.

WANTED—THOROUGH POULTRYMAN, WITH business ability, to take Presidency of large plant on basis of salary and share in profits. Only applicants who have been successful and made profits will be considered. Address full particulars to M. C., care R. N.-Y.

MAN familiar with general farm work from boyhood, desires employment on general or dairy farm, or driving team; wife would also assist. Best references as to honesty, industry and ability for farm service; do not aspire to management of large place. Address F. M. B., care The R. N.-Y., 333 West 30th St., New York.

DAIRYMAN—Wanted for private estate, near New York, a first-class dairyman, married, without family; one who has been accustomed to Guernseys; capable of keeping records, etc.; no others need apply; wages, $70 per month, with free house and light. None need apply whose references will not bear the strictest investigation. Apply "DAIRYMAN," 166 W. 23d St., New York.

WANTED—Position as manager of commercial Agricultural Enterprise on large farm to be run on a business basis; scientific knowledge and practical experience in North and South; silos, crops, breeding, feeding; unquestionable evidence of ability and integrity; at liberty Oct. 1, or sooner; will not consider proposition paying less than $1,800; or might consider taking under lease a good farm all furnished. Address B. D., Care R. N.-Y.

FARM MANAGER—Are you in need of a successful farm manager? Understand breeding pure bred stock, growing all crops, dairying, certified milk, fruit growing, gardening, business management. Wisconsin graduate and formally in charge Wisconsin Experimental Farm. Married, one child; 9 years' experience as manager of large estates. A1 references, including present employer. Not less than $1,500 considered; would consider salary and percentage. SCIENTIFIC, care Rural New-Yorker.

FOR SALE—Improved forty cow farm, good buildings; fruit, water and timber. GEO. BUTTON, New Berlin, Chenango Co., N. Y.

GOOD FARM 200 ACRES, fine buildings, ¼ mile of store, school, depot. EMERSON GREGORY, Owner, Bangall, Dutchess Co. N. Y.

FOR SALE—Farm in rich Nehalem valley, western Oregon; great dairy and fruit region; the country of the future. For particulars write MRS. W. J. D. YOUNG, Jewell, Oregon.

FARM—$2,000 will give you possession of a fine 100-acre farm in Hunterdon County, New Jersey. Crops in the ground; water possibilities; fine for health resort. C. W. A., care R. N.-Y.

FOR SALE—120-acre dairy farm with retail business, excellent markets, nearest dairy to great summer and hunting resort on Jersey coast; crops and stock included. Apply EMGE, care of R. New-Yorker.

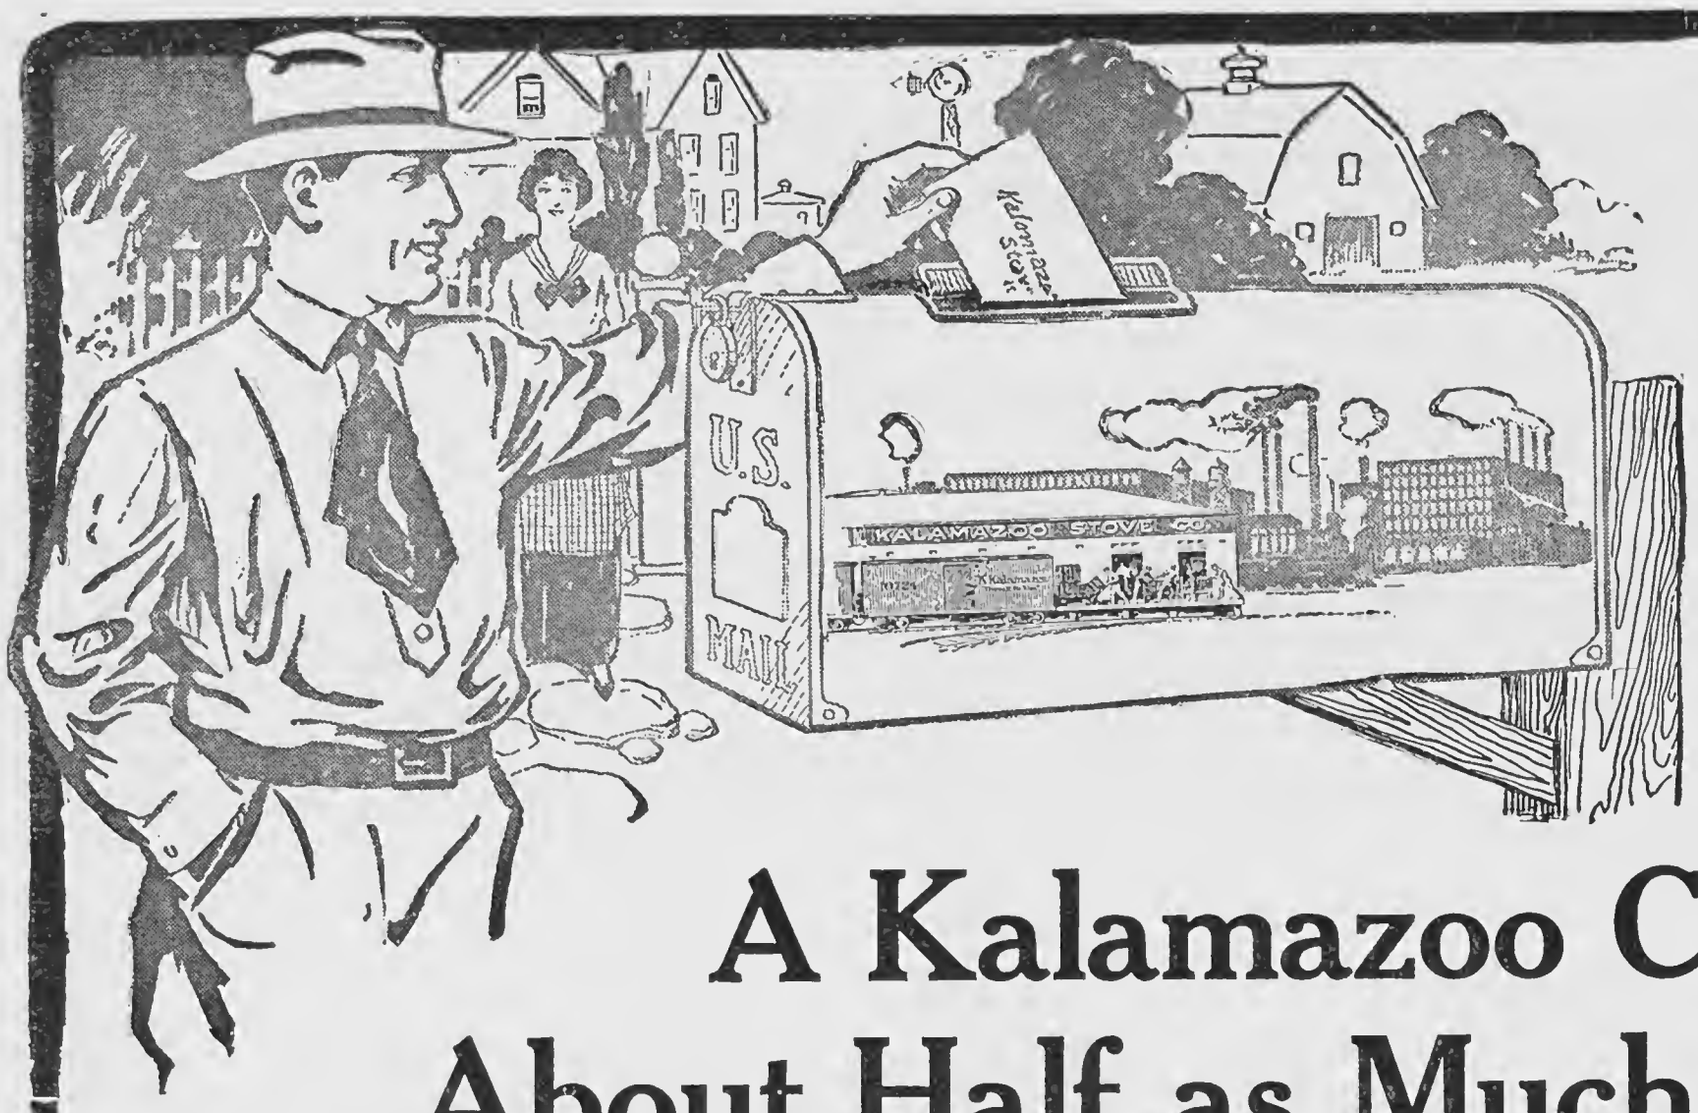
WANTED—To rent small farm, with privilege of buying; anywhere between Dover, Del. and Princess Anne, Md. Must have fruit and on good road. Give full particulars. GRANT PULLHART, Muncie, Ind.

FOR SALE—One of the finest farms in Albemarle Co., Va.; 545 acres; 100 acres river bottom; balance red clay soil; 100 acres Virginia timber; full description in first letter. J. E. BABER, Afton, R. R. 1, Albemarle Co., Va.

LARGE FARM—Stock hay, crops, tools, good buildings, cuts 60 tons hay, 200 fruit trees, large sugar grove, 500,000 ft. timber, mile large railroad town, adjoins large lake, Summer resort, sacrifice quick buyer; part cash. Address OWNER, Box 100, Wilmington, Vt.

TO LET OR FOR SALE—Good water power, factory and tenant buildings, excellent condition on State road at Malden Bridge, Columbia County, New York, three miles from Boston and Albany station. Great opportunity for manufacturer with light transportation. Write for particulars. E. W. RIDER, 50 Court Street, Brooklyn, N. Y.

FOR SALE—Owing to war, attractive place suitable for Summer boarders, 18 rooms, new plumbing and bath, large verandas, 2 cellars, children's play house in grounds, 12 acres land, fine truck garden, apples, pears, ice house, good barns, new pigeon pens for 1,000 birds; excellent water, large shade trees; wonderful climate; one mile from station. Owner will sell on easy terms and leave some furniture, if desired. References given and required. Price $7,500. Address BYAM, East Chatham, N. Y.

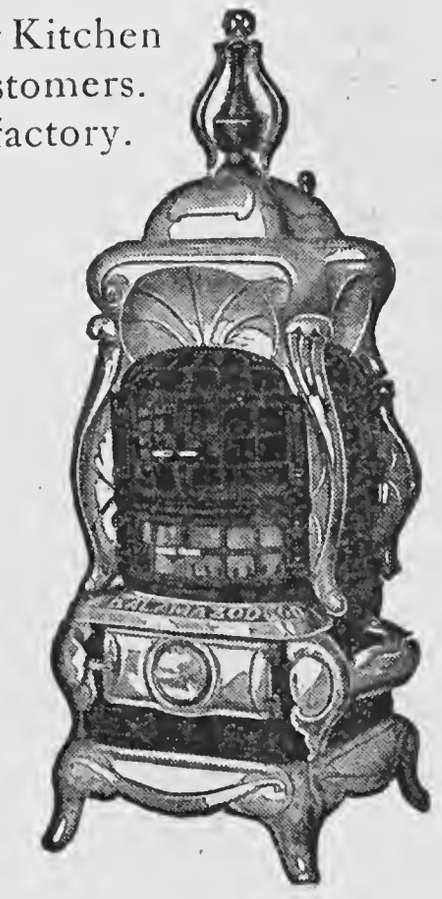


You are as Near to the Kalamazoo Factory as You are to Your Mail Box

A Kalamazoo Costs You About Half as Much Because Uncle Sam "Handles" the Order

Wholesale Price or the Dealer's Price—WHICH?

YOU are as much entitled to a Kalamazoo Stove, Range, Furnace or Kitchen Cabinet at the Kalamazoo factory price as any of our 275,000 customers. It is just as easy for you to get one as if you lived next door to our factory.



Why, then, cheat yourself with an ordinary stove, at a high price, when you can get a Kalamazoo for much less?

It is all a matter of habit. Some have the habit of stepping into the store and paying what is asked. Others have the habit of sending to a "Catalog House" —for the sake of price, regardless of quality. And now more and more people are forming the habit of *investigating.*

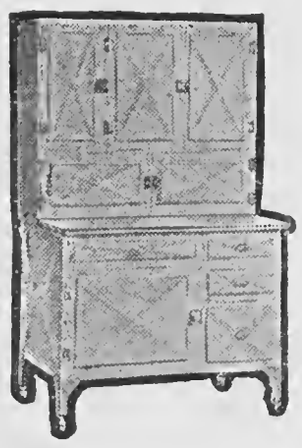
They figure that those who actually *make* the goods must be able to sell them at lowest prices. So when they want a stove they write to the makers of stoves—the Kalamazoo Stove Company—the largest manufacturers in the world dealing direct.

The coupon or postal card brings the catalog. There is no other like it. It makes the buying of a stove a pleasure instead of a task. It shows every kind ever built, every improvement ever thought of—lots of features that you can't get anywhere else at any price.

Your mail box is handy. Clip the coupon below or just write a postal asking for the book. That will bring to you the greatest display of fine stoves at low prices in America.

This Book Sets the Styles in Stoves—Turns the Light on all Stove Secrets —and Protects You on Price

It has helped 275,000 families to a better stove at a lower price. Ask any Kalamazoo customer. They are everywhere. Some near you. Ask for names and addresses.



Kalamazoo Kitchen Cabinet
All Metal White Enamel

Only Kalamazoo customers know how handsome, convenient, sanitary and durable a kitchen cabinet can be. Nothing else built equals this time-saver, labor-saver and money-saver. Direct to you at factory prices. Free Trial. Year's guarantee. Cash or Easy Payments.

Write for Special Catalog

500 Styles and Sizes—All Prices—Free Trial

Don't Pay Until Trial Has Proved Extra Value, Every Order Shipped Prepaid, No Delay, Time Payments If Preferred

That is the offer that has broken the habit of careless buying in 275,000 families.

That is the offer that has saved $5.00 to $40.00 for each and every one of these customers and will save as much for you.

But this advertisement is not asking you to *buy* a Kalamazoo. It is only asking that you send us your name and address so we can mail you the Kalamazoo book.

A book that has stirred up the sensation this one has in the stove business, and has saved, all told, some twelve million dollars for stove buyers—yours for a postal.

Kalamazoo Furnaces are going up in all parts of the country because people are learning that they not only save $25.00 to $75.00—but get a better heating and ventilating system. Write for the Furnace book and get the most expert heating information and the best Furnace proposition in America.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

Vol. LXXIII. No. 4277. NEW YORK, OCTOBER 17, 1914. WEEKLY $1.00 PER YEAR.

Cornell University Library 26314

OCT 17 1914 LIBRARY.

PLAIN TALKS ABOUT BEES.

Fruit Work; Lazy Bees; Hive Population.

THIS past season we have had a dozen to 15 colonies of bees on the farm. We knew what bee-keepers claim regarding the value of bees in working on the apple bloom, and we made careful observation in order to test these claims. We are convinced that the bees greatly increased the number and quality of the apples. Becoming greatly interested in the work of these little creatures we have been asking about them—questions not usually answered in books. The following notes are made up from answers to questions asked of E. R. Root of Ohio:

BEES AND FRUIT.—"I understand you have records of cases which absolutely prove the value of bees in the orchard."

"You possibly saw the mention of the experiment recorded in our journal, something I know absolutely about, because I was an eye witness to the whole thing. There was a 50-acre orchard about nine miles north of Medina that had not been yielding any fruit and such fruit as did come from it was of a poor wormy kind unfit for market. Some practical fruit growers got hold of it. Van Renseller and Southam, and secured a lease on it for five years with the option of purchase at the end of the fifth year. They also asked for 50 colonies of bees, which we were glad to supply. The first year they carefully pruned the trees, sprayed them before and after blooming, and then took 16,000 bushels of perfect apples, selling them at an average price of 80 cents per bushel. In fact, they offered a prize to anyone who could find a single apple on the ground under any of their trees or on the trees that was wormy."

ONE OF THE LABORERS IN THE VINEYARD. Fig. 525.

HOW MANY NEEDED?—"How many bees does an apple orchard require?"

"I have roughly estimated that it takes about a colony of bees to the acre. While a single colony in a good year, under favorable conditions, will take care of five times that number, yet there is so much of the early blooming time that occurs during bad weather that the bees have only a very limited opportunity to get at the trees. It is, therefore, necessary to have a larger number of bees under those conditions."

DEPENDS ON THE QUEEN.—"Are all colonies equally productive or are some more industrious than others—as might be said of other animals?"

"Some colonies are much more industrious than others. One colony will have a queen whose bees will produce 200 or 300 pounds of surplus honey in a season, while another colony right side of it will produce only 25 or 30 pounds. The value of the colony rests primarily in the value of the queen. There is just as much difference between colonies of bees as there is between human beings, or, rather, I should say, the difference is greater."

ABOUT LAZY BEES.—"And what about the busy bee? As a boy I was told to exert myself as the bees were supposed to do, yet I always suspected some bees were industrial frauds or loafers. Are there not lazy bees in the hive?"

"It is also a fact that some bees in a hive are lazy, and all of them are lazy at times. After a bee has been out foraging for perhaps two or three hours, gathering a load of nectar, it will very often go inside the hive and deposit its load and per-

haps it will lie almost entirely motionless for a couple of hours or more. Observers have watched bees that have come from the fields, go into the hive, crawl into a cell and lie motionless for two or three hours at a time. The old legend, 'busy as a bee,' does not always apply. If we had hired men that would work half a day and then loaf half a day, well, I don't know what we would do with them; but that is what the bees do sometimes, although ordinarily in the height of the season it is my belief that most of the bees are busy on the job from daylight until dark, but when the picking is poor and there is not much nectar to be had the bee goes into the hive and takes a period of rest. Whether these rest periods are common with other bees I am not entirely sure. It would take hours and hours at a time to determine the point, and what is more, it would be very difficult to look down inside the hive without disturbing the normal routine. When that is once disturbed bees will do a little differently from what they would provided they were left to their own sweet ways."

POPULATION OF A HIVE.—"About how many bees are to be found in the average hive?"

"The number of bees in an average hive will vary according to the season. In the Spring of the year there will probably not be more than about 10,000 individuals. About the time clover begins to come into bloom this number will be increased from 10,000 to 25,000, or even 50,000. A hive with 50,000 bees in it would be a very strong colony, and is the exception rather than the rule."

A BEE CENSUS.—"How is it possible to count bees in this way?"

"I have weighed a good many swarms of bees as they have been brought in by farmers. The heaviest swarm I ever knew of that was brought into Medina weighed five pounds and a half. A pound of bees that has been well fed or has taken with it all the honey it can carry will contain about 20,000 bees. If it is two or three story, as they often are for the production of extracted honey, it would contain two or three times as many."

$140 PER ACRE FROM CORN.

IS it possible to make about $90 per acre on corn in New York State ($90 net profit), as is done on the Hospital State Farm in South Carolina? I see the statement in the *Country Gentleman*, called "A Fortune from Run-Down Farms." If possible, how can it be done in New York State? G. B.

Syracuse, N. Y.

"All things are possible," but not all are profitable or expedient. The article with these large figures describes a farm at an insane asylum! The writer says it required 15 years of dreaming and 20 years of hard work to make the dream come true. The income from this farm per acre is given as follows:

INCOME.

One hundred bushels of corn, at 90 cents	$ 90.00
Three tons of silage from stalks, at $2	6.00
Two tons of corn stover, at $12	24.00
One ton of pea-vine hay	20.00
	$140.00

The expenses per acre are given at $49.25. The price of good No. 2 corn in New York city is 85 cents, or a little over. It is doubtful if cornstalks would sell for more than $8 per ton. The ton of pea vine hay, of course, could not be secured in New York State. In South Carolina it is possible to sow cow peas in the corn as a second crop. After the corn is cut the long Southern season enables the cow peas to grow and make a good crop. There have been cases where on single acres yields of 100 bushels of corn have been produced in New York. Our best farmers would be well satisfied with an average of 70 bushels, while 50 would be very good for a beginner. The cost of growing the acre would probably be greater than the figures here given, while the income would be $40 or more less. If anyone has ever averaged a profit of $90 an acre growing corn in New York we would like to hear from him. Such glowing stories may have a basis of truth. They often show the possibilities of some unusual cultivation, or location, capital and skill. We have on our own farm a field of a little over an acre which gave last year 175 barrels of apples and over $200 worth of strawberries. At the same time other acres produced barely enough to pay for the labor of working them. You must also remember that these figures showing an income of $140 per acre do not represent cash sales, but estimated values—a very different thing. We avoid the printing of such great stories unless the figures are qualified and explained. The trouble is that these stories are read by inexperienced people who want some short cut to wealth at farming. Several of such people have already written us about these articles. They are almost persuaded to buy poor land and spend their money at farming when every practical farmer knows that they are simply chasing a gold brick. We cannot see that such extravagant articles do any good as practical educators, and they certainly give the untried and susceptible a wrong idea of farming. Practical farmers know how to sift them down, but the back-to-the-landers are unable to do this.

BARNS OF STEEL OR CONCRETE.

I WOULD like to know your opinion on steel barns. I am about to erect a small barn on an 18-acre place, but have not sufficient capital to try experiments. Will the steel barn sweat, and make damp hay? H. Mc C.

Hockessin, Del.

I am glad to note the demand for permanent farm buildings. Self-supporting trussed steel barn frames have been constructed which give great strength and economy of floor space. These have been, I think, in every way satisfactory. But the first cost is great, too great to permit of general use.

The permanent structure, which is popular to-day, is the reinforced concrete structure. Barns are being built entirely of concrete and steel that are permanent, fireproof, neat and economical. The economy of reinforced concrete is due to the fact that when a beam of any material is supported at the ends and subjected to a load, the fibers in the upper surface of the beam are subject to a compressive force, while those in the lower part are subject to a tensile (pulling apart) force. Concrete has a very great *compressive* strength, but a very poor *tensile* strength. Steel has a very great tensile strength, and by embedding a very small per cent. (commonly three-eighths of one per cent.) of steel in the lower part of a concrete beam, its tensile strength is made equal to its compressive strength. Steel costs 10 times as much per pound as concrete, and a concrete construction with a small per cent. of properly placed steel reinforcement, gives a greater strength for the cost than either concrete or steel alone.

The cost of a finished reinforced concrete building is said to be in general about 10 per cent. more than

THE PRIZE CHICKEN. Fig. 526.

a good frame building, but the saving in insurance, paint and repairs will probably in the end make the permanent building the cheapest. It is estimated that a trussed steel frame will cost about 15 per cent. more than reinforced concrete, and reinforced concrete will cost 10 per cent. more than wood. For a small barn on 18 acres I would suggest the hollow cement block structure with concrete floors. This is neat, durable and serviceable.

None of the types under discussion "sweats." A wooden structure absorbs and carries away to some extent the moisture from damp material, or that exhaled from animals, and is dry. A monolithic (solid concrete) structure is a good conductor of both heat and moisture, and may be cold and damp. The hollow block tile or double-walled concrete structure should be dry and of even temperature for a stable.

F. L. ALLEN.

THE VALUE OF SHEEP MANURE.

THERE has been of late much talk about pulverized sheep manure as a fertilizer for farm work as well as gardening. Some quite extravagant stories have been told about this manure, and we are frequently asked if it will pay a farmer or gardener to buy it in place of stable manure or high-grade fertilizers. The following notes by Dr. E. H. Jenkins tell the story fairly and well:

Sheep manure has this to commend it: It is an animal manure, which is fine, has no coarse litter in it, and is comparatively inoffensive in odor. For the greenhouse and the lawn it is worth considering, but for farm use—let us see.

We pay $2.85 per ton for N. Y. stable manure delivered at our freight station. We pay $30 for sheep manure pulverized, though in car lots it may be considerably cheaper.

We buy about 10½ tons of New York manure for the same price as one ton of pulverized sheep manure and for our $30 we get:

	In one ton sheep manure, pound.	In 10½ tons N. Y. stables manure.
Organic matter	1,426	4,704
Nitrogen	47	128
Phosphoric acid	33	115
Potash	39	117

When we buy manure we buy it for the quickly decaying vegetable matter in it. The "plant food" is rather a side issue. We can get them cheaper in chemicals. I should consider good stable manure at $2.85 per ton a better purchase than sheep manure at anything over $8. E. H. JENKINS.

TREATMENT OF AN APPLE ORCHARD.

I HAVE an apple orchard 30 years of age. The trees do not bear what they should, as most of them look very healthy. Some trees in a row will be loaded well with fruit and those next to them will only have fruit on one side. The orchard of 350 trees had 300 barrels four years ago, but since that it averages about 100 or 150. What is the best plan to bring this orchard back to good bearing? It has been in sod three years. I intended to prune the trees, removing all dead limbs, spraying with lime-sulphur, and then plow the ground this Fall, sowing buckwheat on it in the early Spring with about 400 pounds of good fertilizer to the acre, and when the buckwheat is in blossom to plow it under, and keep the ground harrowed for the rest of the Summer, then in the Fall sow rye to be turned under in Spring. Is this a good plan? Also the kind of fertilizer to use and amount of same to acre. T. W.

Greene Co., N. Y.

You plan to prune your orchard, removing the dead branches. I would remove more than this, in order to let the sunlight into the center of the tree. There is danger of thinning out too much, so that the growth will go to the branches rather than the fruit.

You plan to spray with lime-sulphur, using three gallons to nine gallons of water. The commercial lime-sulphur which tests 32 or 33 Beaume needs to be diluted 35 to 40 times before it can be used on trees in leaf. I would suggest the following plan for spraying your orchard.

1. Dormant season before the leaf buds open but just as they are swelling. Use lime-sulphur 32 Beaume and dilute the concentrate 1-8. Add lead arsenate to the lime-sulphur in the proportion of two pounds to 50 gallons.

2. After leaf buds open, but before blossoms open. Spray before rather than after a rain. Lime-sulphur solution 32 Beaume diluted 1-40 and arsenate of lead 2-3 pounds to 50 gallons.

3. After petals have fallen, beginning when about two-thirds have fallen. This is the most important application. Use same mixture as at the second spraying.

4. Ten days to two weeks later. Before rain period. Same mixture as at second spraying.

5. Eight or nine weeks after the blossoms fall. In case of late scab infections or attacks of codling moth. In most seasons this mixture is unnecessary. Same mixture as at second spraying.

If aphis appears spray before leaves curl with whale-oil soap, one pound to six gallons, or with kerosene emulsion diluted with six parts of water or with one of the tobacco extracts.

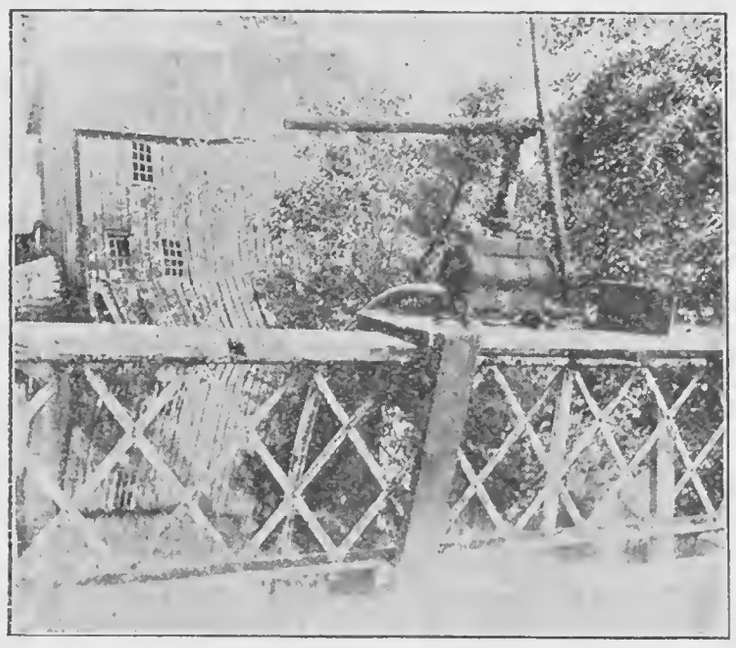
The use of a cover crop in combination with clean cultivation during the Summer is good orchard practice. I would change your plan a little, however. Instead of sowing buckwheat in the Spring I would harrow the orchard until August, and then sow buckwheat and rye together. It might be well to include a leguminous crop. Before sowing the cover crop I would apply the fertilizer. The fertilizer should consist of about 8 per cent. phosphorus and 10 per cent. potassium. The phosphorus may be in the form of acid phosphate or basic slag phosphate, and the potassium may be in the form of muriate of potash or sulphate of potash. Four hundred pounds to the acre should be sufficient. You may find that commercial fertilizer will not be always necessary, but it will be wise to apply it the first year.

F. W. L.

A SMALL HEN WOMAN.—It is gratifying to see how thoroughly interested our readers are in their children. Evidently the homes into which THE R. N.-Y. goes are cheered and brightened by these little folks, and the older people are proud of their children, and try to make much of them. We have pictures sent us of this young stock, from time to time. There used to be a period when farmers seemed more likely to send pictures of themselves, with a suggestion that they would look well in print. We have less of that now than ever before, but very much more of the suggestion that the little folks might well be shown. This is what we like, and we are glad to show some of these little people when the photographs are clear enough to make a good engraving. The little two-year-old girl shown at Fig. 526, is Winona H. Brock. Her father, Andrew C. Brock, of Delaware County, N. Y., sends this picture. Mr. Brock's farm is known as "The Maples," and we are sure that this little hen woman is the life of the farm, and as sweet as any maple sugar.

ORGANIZED FRUIT BUSINESS IN MICHIGAN.

SOMETIMES a lot of good comes from what seems to be nothing less than a mass of ruins. The old grist mill shown in Fig. 527, has long been in the discard in Allegan County, Michigan. The old dam, however, has been reinforced by the use of concrete, and is now serving a very useful purpose. The farmers in the region bolted a pump to one of the rails of a bridge spanning the dam, and dropped a suction pipe into the dam. In proper



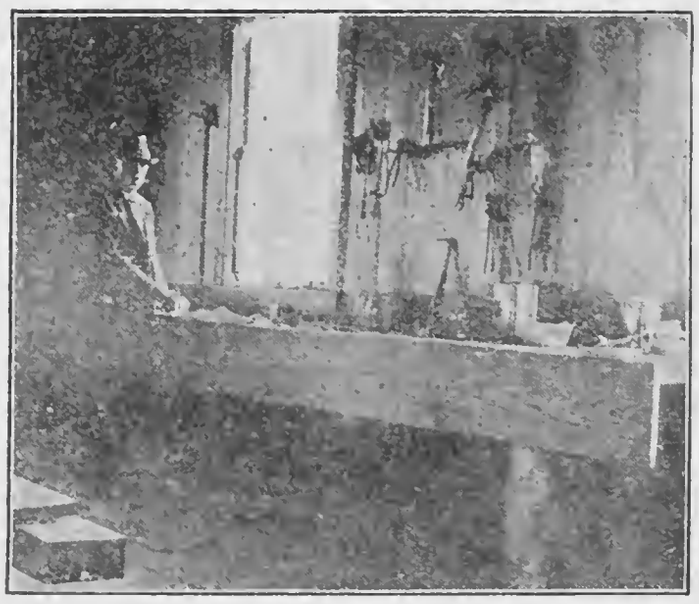
A WATER SUPPLY FOR SPRAYING. FIG. 527.

season the water is pumped up and hauled away in barrels to use in mixing spray material for hundreds of acres of trees around and about the old mill-site. Scores of fruit growers get their water supply from the old dam for this purpose.

The other picture, Fig. 530, shows the result. It shows the front of a fruit receiving and shipping shed. The loaded wagons drive through the rear part of the shed, and the packages are transferred to long push cars. The cars being loaded are pushed over a stilted double-track railway over a sandy beach and a bar. At the end of the railway is a steamship in water deep enough to float it. This ship then transfers the load to a large lake liner which crosses Lake Michigan to the Chicago and Milwaukee market, where a big consumption and outside distribution of fruit takes place. The car shown in the picture is loaded with peaches, the production of which largely was aided by the spraying process. J. L. GRAFF.

WINTER CARE OF THE SUMMER MACHINE.

ESSENTIALS FOR CARE.—The greater portion of the mechanical equipment of the farm is Summer machinery, i. e., it is machinery such as the grain drill, plow or harvester, that is designed for Summer use. Such machinery is idle in the Winter, and during this time it should be so cared for that the deterioration will be as slight as possible. Only too often this period of rest from one season to another takes more out of a machine than the field work done by it. The first essential for Winter care is proper storage. Perhaps no other one thing, unless it is the lack of systematic



A COMFORTABLE FARM REPAIR SHOP. FIG. 528.

repairs and adjustments, so affects the life of a machine. By proper storage is not necessarily meant a tight roof only; other conditions enter that may more than counter the good done by a tight roof. The writer has seen machinery stored under an absolutely tight roof with tight side walls as well, that would have been in better condition in the Spring if wintered out of doors. An unventilated stable was below it, and the machines were constantly wet from the vapor of the stable condensing on them. Stable vapors are absolutely fatal to most paints, and it is but a short time until it peels off, leaving the metal beneath it to become pitted and weakened by rust.

THE STORAGE SHED.—A storage shed for farm machinery should be free from stable vapors and should have ventilation. In our climate we have some very rapid changes in temperature during the Winter. When the weather changes quickly from cold to warm, moisture is condensed on the metal parts of machinery, and unless good ventilation is provided it is not evaporated quickly. A shed of the style illustrated in a previous article, page 1079, has much to recommend it; it is cheap, has a tight roof and a free circulation of air. A system of doors would improve it for nearly every farm has poultry, and poultry and farm machinery has a great affinity for each other to the detriment of the machinery. If doors are out of the question protect the machines by blankets made from the ever-present bran sacks.

NEEDED REPAIRS.—As the machinery is stored broken parts should be removed and carried to the shop, or, at least, a note made of their location so that it may be attended to on the first rainy day. Repairs should then be ordered, for Winter should be the time for repairing, re-adjusting and painting the farm machine. Repairs ordered now will not tie up the work if they are a few days late. The branch house dealing in repairs can give better service now than it can in the Spring, when everybody is rushing them for extras, and you have more spare time to fit and adjust the new parts to the machine than you will have when the rush season comes. A well-equipped and comfortable farm shop does much toward making these Winter repairs comfortable, as well as possible. The shop should be made tight enough to be warm, and then see to it that it is used enough to get a good interest on your investment.

METHODS OF PROTECTION.—Plows and other implements having a polished metal surface should

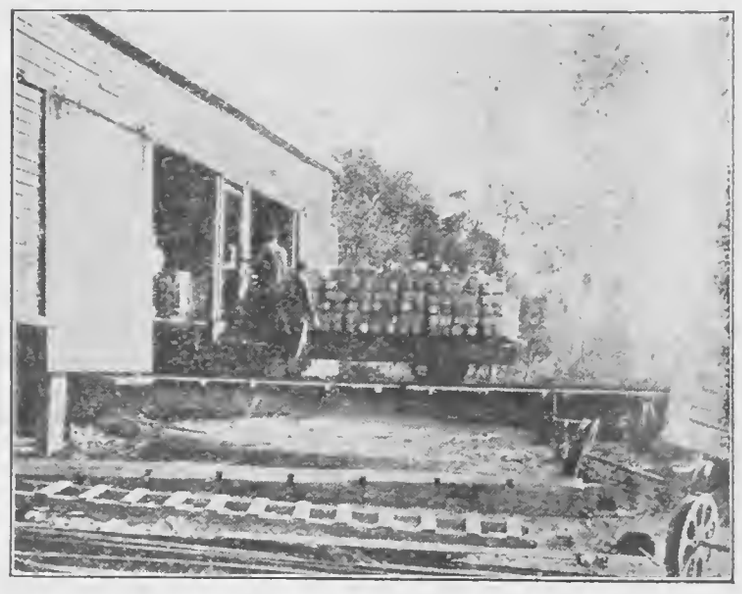
REMOVE THE BROKEN PARTS. FIG. 529.

be protected by a coating of grease or a cheap varnish of some kind to keep them from rusting. The "land polish," on your plow cost you money, and your team hard work to get; it is necessary for good work; why not keep it? If there is no floor in the shed pieces of plank should be thrown down and the machines run on to them so that they will be up out of the damp. By placing blocks under the corners of the frame the weight may be taken off the tongue or the tongue may be taken off entirely, making more storage room. Apply grease liberally to the knives of mowers and harvesters. It is best after coating them with grease to wrap them in old sacking or burlap, this protects them and helps to prevent accidents. A place that is often overlooked is the metal lining under the canvas back of the cutter bar in the harvester. In use the paint gets worn from both sides of this and unless repainted or kept greased it soon rusts through. If not done before see that the seed and fertilizer hoppers of the grain drill are cleaned out. Chemical fertilizers have a tendency to rust the metal parts. Open dishes of unslaked lime set in these hoppers take the moisture from the air and help to keep the rust from forming. Calcium chloride is even better for this purpose, and is inexpensive. Fight rust, it is the enemy of the farm machine, and can be controlled only by good shelter and the liberal and sensible application of good paint and grease. ROBERT H. SMITH.

WILD DEER AND FARM STOCK.

THE R. N.-Y., I am aware, has a large circulation. Possibly it reaches the man in this country who is complaining of the increasing cost of living. In that hope I write to lend him a bolt for his bow. The State of Connecticut has a long-winded law which gives to the patient reader the information that wild deer shall not be destroyed except upon one stated day yearly; and further, if deer do damage to crops the State will make good the farmer's losses. There is only one occasion when deer may be killed out of season, and that is when a farmer is a good enough woodsman to find them at their depredations and a good enough shot to scotch them before they bound over his neighbor's fence. A deer killed is not, as in the old days, venison found. The game warden has the disposition of the carcass, and he usually has a long throat for steel-drilled flesh.

Connecticut has not now sufficient pasturage to supply beef for its citizens. Therefore, seeing that cattle raising is a useless expense, the Legislature generously gives a small class of men known as



LOADING FRUIT FOR THE BOAT. FIG. 530.

"hunters" (because they can pull a trigger without being kicked flat) the right to pasture a million or so of deer on those same over-worked pastures. No one can use these (public) tons of converted (private) grass for food unless he belongs to the small sect whose privilege it is to let off primitive zeal one day annually.

The deer trample corn, eating a little. The State pays for what they eat but not for what they trample. That's up to the farmer. Many farmers lose even this small return, because they do not trust the State—in which I will not initially blame them. An instance is before me, that of an Italian who planted an acre to cabbage. The next day his wife saw 19 deer pass his house, and when he saw his cabbage sprouts again there were not enough to count. He didn't go to the State, but asked a neighbor what to do. The neighbor angrily said: "You live out of hearing of any other farm. Can you shoot? Well, then, you just lay for them critters an' you pepper 'em till they look like jerked beef. Then you salt 'em down an' say nothin'. Come Winter you won't miss the bootcher wagon."

That Italian will do well if he follows that advice. Public opinion used to back the deer laws. It doesn't now. Not where it counts. City folk who shoot have no opinions on the subject of real value. The laws are paling into dead letters and should be changed soon. When they are changed they should be drafted so that any man, hunting alone, may kill deer for food. Not more than one a month should any man kill. No butcher should be allowed to sell the meat—no clique should be allowed to hunt for profit. But it is manifestly ridiculous that with beef selling at the cost of butter so many pounds of good meat should be permitted to vie with the farmers' stock on their own land.

One good turn the deer do do. They keep the

SCOUR AND GREASE THE METAL. FIG. 531.

woods fairly clear of underbrush, a doubtful good, since partridge need the brush to nest in and they do good. BATTELL LOOMIS.

Connecticut.

THE Kansas Agricultural College has two resident physicians, one a man—the other a woman—the latter for the girl students.

THE Department of Floriculture at Cornell University, Ithaca, N. Y., has issued Extension Circular No. 8, calling attention to the opportunities for young men in floriculture.

A FUNGUS disease of cultivated mushrooms has been causing much loss to commercial growers. The U. S. Department of Agriculture has issued a bulletin on this subject, "The Mycogone Disease of Mushrooms and its Control," which should be studied by anyone engaged in mushroom culture.

FARMERS' CLUB

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Formalin for Fumigation.

LIKE some others, we have to store potatoes in our house cellar. The cellar is now empty and I wish to fumigate it with formaldehyde. Will commercial formalin, 40%, exposed in shallow vessels be sufficient? Will the gas injure any articles of furniture or clothing in the house above? The purpose is to destroy fungi. G.
Exeter, N. H.

"Forty per cent. formalin exposed in shallow vessels" would not be effective in destroying fungi either on the potatoes or in the cellar. The treatment of the cellar with formalin before storage of the potatoes would not, it seems to me, be of particular value, and such treatment after storage would be of use simply for scab. The treatment with formalin fumes now in use, according to Stewart's recommendations, is at the rate of three pints formaldehyde poured over 23 ounces potassium permanganate, to every 1,000 cubic feet of space. In order that the potatoes shall not be injured, however, be found that much of this space should be occupied by the potatoes, and that at least 167 bushels of potatoes should be included in this amount of space. If the cellar is not tight, the fumes might escape into the rooms above and cause some irritation, but there would be no injury to articles of clothing or furniture. G. P. C.
Conn. Experiment Station.

Trouble from Rabbits.

WHAT can I do to get rid of rabbits? They ruin my crops as they come in great numbers. Is there any way I can poison them? R. W. C.
New Jersey.

In my opinion, the best remedy for rabbits is a good cocker spaniel and a shotgun. If I were in the position of R. W. C. and the State law did not forbid or, as in New York, permitted the killing of rabbits that were destroying crops, I should resort to systematic hunting, especially whenever there was a tracking snow in Winter. The rabbits that injure crops are easy to destroy because, except in the mating season, they seldom travel more than a quarter mile from their regular resting place. In half a day a well-trained dog should bring within range most of the rabbits that are troubling R. W. C. and the rest is simply good shooting. A few outings at intervals of a week or so should end the nuisance. If feed were abundant all the Summer there should be little trouble if all the brushy land and fence rows were cleared up and planted to annual crops to be cultivated regularly and *frequently*. When feed is scarce the rabbits will go and stay where they can be near a supply. If we find the rabbits so numerous as to threaten our orchards or nurseries we hunt systematically whenever there is a good tracking snow, and usually have them so reduced that no damage is done when deep snow comes. A. C. W.

Celery in North Carolina.

I HAVE a strip of land lying between two mountain branches which is sandy loam, mostly sandy and rather damp. I have been advised to put this in celery by splitting furrows with a two-horse plow and filling it up with new dirt from a hard-wood forest. Would this bring good celery, or what would be the best method for preparing this spot for celery?
Swannanoa, N. C. J. A. W.

I have seen as fine celery as is grown anywhere produced on the bottom lands of the Swannanoa and French Broad in your section. The natural soil of your bottom land will be better than leaf mold hauled in, if you fertilize it as needed. It is too late to set celery plants now in your elevated mountain section, where the plants should be set in early August. Soil inclining to clay will usually make more brittle and crisp celery than peaty soil, but a sandy loam will make better celery than the black soil in quality, though not so large perhaps. That is, provided there is unfailing moisture in the soil. Of course the soil must be fertile, and if not so must be heavily fertilized especially with some carrier of phosphorus, such as acid phosphate, and nitrogen. Your soil as a rule has an abundance of potash. Years ago a grower in your section sold his celery crop in Raleigh, and I had an opportunity to test it and found that it was peculiarly fine, and far better than can be grown in the warmer parts of the State. Moisture and plenty of plant food have more to do with the making of good celery than the particular character of the soil, though I have found that a loam soil will make usually more crisp celery than a black peaty soil, where it is apt to grow large and coarse and stringy. W. F. MASSEY.
Maryland.

Septic Tanks.

HOW big should a septic tank be for an ordinary family? How thick should the wall be and how much disposal tile should there be? R. B. O.
Cheshire, Conn.

A septic tank with an interior width of three feet, length of six feet and depth of 4½ feet would be amply large for a family of eight people. The walls should be of concrete six to eight inches in thickness. The number of feet of tile required in the disposal system depends upon the character of the soil. From 10 to 12 feet for each person using the system might be required in a loam soil while half of that amount would answer in open gravel. The principles of septic tank construction are well discussed in a bulletin entitled "Sewage Disposal for Country Homes," issued by the State College of Agriculture at Ithaca, N. Y. This bulletin is free to residents of New York State and will probably be sent to others as far as practicable. M. B. D.

Leaving Onions Out All Winter.

WOULD it hurt small onions to leave them out all Winter, or should I dry and set out in Spring? Would they go to seed? When is time to pull late onions? P. G.
Waterville, N. Y.

Here in Southeastern Maryland I have already planted my onion sets to make green bunching onions in the Spring. I have also planted sets of the Yellow Potato onion, which makes no seed, but makes ripe onions in June from the Fall-planted sets. Onion sets from the seed, when planted in the Fall, are very apt to run to seed in the Spring if allowed to grow for ripening. I plant in the Fall only for early green bunching. Small onions left in the ground now, if they live through the Winter in your climate, will make good green onions, but will be pretty certain to run to seed if left to get fully grown. Mr. T. Greiner found that the Silverskin onions would winter with him in Western or rather Northern New York, and hence I suppose they would live out with you
Maryland. W. F. MASSEY.

A METHOD of keeping onions in Winter comes from the Colorado Agricultural College. Allow the onions to freeze solidly and keep them frozen, and their value will in no way be impaired. Alternate freezing and thawing injures them. The advice suggests selecting a dry, somewhat elevated place; on this place a box or frame of desired dimensions for the onions to be stored. The depth of the box should not be over 16 or 18 inches. Pieces of 2x4 or 4x4 should be placed under the box so that the box will not come in direct contact with the moist soil. The floor of the box should be reasonably tight. After the onions have been thoroughly cured and topped, they should be placed in the box and the boards placed on top. The cover should be water-tight. Before cold weather sets in keep the cover raised to permit ventilation. No other protection is given the onions, but they are permitted to freeze solidly, and when in this state the box should be covered with dry straw or cornstalks, or any material that would prevent the onions from thawing out. In the Spring, or when ready to be sold, the covering should be removed gradually and the onions permitted to thaw out without coming in contact with sunlight. During the Winter or while frozen, they may be taken out and gradually thawed in a cool room. Frozen, the onions will keep perfectly, and when thawed will remain solid for considerable time.

"For the Land's Sake, use Bowker's Fertilizers; they enrich the earth and those who till it."—*Adv.*

Fifty Daffodils For a Dollar

All extra good bulbs which will give many beautiful golden yellow flowers next spring if planted in the garden before the ground freezes. Daffodils will bloom for several seasons, which makes them specially good for garden culture.

These Fifty Daffodil Bulbs, All Extra Choice, will be sent anywhere for $1.00

We have a fairly good supply, but advise ordering early if you want to secure bulbs at this special price.

Our catalogue is ready. Send for a copy and see our list of Hyacinths, Tulips, Crocus and other Bulbs for fall planting and spring blooming.

Don't Neglect Fall Spraying **"SCALECIDE"** Fall Spraying is Best

TRADE MARK REG. U. S. PAT. OFF.

"Scalecide" will positively destroy San Jose, Cottony Maple Scale, Pear Psylla, etc., without injury to the trees. Endorsed by Experiment Stations.

Our booklet, "Scalecide, the Tree Saver" proves our every assertion. Mailed free. B. G. Pratt Co., Dept. "N", 50 Church Street, New York City.

Waterproof Paint for Tents.

WHAT paint could be used on a tent top to stop it from leaking? Is there anything I could put in the paint to keep it fireproof? G. A.
Herrin, Ill.

I know of nothing that would fireproof a tent top; its very nature is opposed to it, as any chemicals to fireproof same would wash out in the rain. Cloth is fireproofed where used indoors; even then it takes two or three applications a year to hold it so. To paint it use one-half pound of alum to a gallon of water (just put alum in water and stir up). Wet top with this thoroughly; when dry, use linseed oil and white lead to make a paint to cover same. Mix as follows: one gallon will cover about 80 square feet on first coat and about 300 square feet on second coat. Measure tent, get what you need. Raw linseed oil will cost about 70 cents a gallon, white lead about 8½ cents a pound. To every gallon used on first coat use five pounds white lead; on second coat use 12 pounds to a gallon. Mix for each coat separately. Just put oil into a tub, add as many pounds of lead as above, take a stick and mix it up well. Tie a piece of bagging or cheesecloth over another tub and pour paint on it and push it through with a brush. Do this both coats, and just before you start to use the paint, add about a wineglassful of liquid drier to every gallon. Brush it in well (I don't mean the drier, I mean the paint); mix drier into paint well before using it. A. F. R.

Building a Water-tight Cistern.

FROM time to time I note queries and comments regarding waterproofing cement construction. Several years ago in an engineering publication, I noticed an article on this subject stating that 5 per cent. of hydrated lime added to the cement would make the concrete impervious to water.

Wishing to construct a cistern of 7,000 gallons capacity I wrote a cement company regarding this matter, and their engineer replied that 10 pounds of hydrated lime added to each 100 pounds of cement would be better than five, and would make the resulting mixture absolutely waterproof, and, instead of having a tendency to weaken the concrete he stated it would possibly have the opposite effect.

We dug the desired hole and placed four inches of concrete on bottom, which we kept covered with water during the night; following morning had carpenters place casing, allowing four-inch walls all around the cistern.

We were careful to have the mixture very thin and tamped it thoroughly, placing the entire amount without allowing any to set.

As soon as the cement had become hard we turned water in and found we had a perfectly tight job, except one small leak about 18 inches from the top, where the mixture was not quite thin enough. Below this point we have let water stand for several months, and none whatever leaks away. It was never necessary to brush or smooth-coat any portion of this work except the small hole mentioned previously. E. J. W.

Ditching in the South.

WE have a traction ditching machine, contractors' size, cuts a trench six feet deep and 19 inches wide. We have been working with it this Fall in this locality, and as we shall be unable to use it this Winter I would like to inquire if there are any prospects of getting drainage jobs anywhere in the South that would pay to ship the machine there for the Winter? We can do machine trenching, which is better than hand work, for about one-half what it costs to do the work by hand in this locality, and as tiling has grown so popular in the last few years, think perhaps if we could hear of a locality that needs it, and the farmers are able to have it done, we could work up some business that would be of benefit to the community as well as ourselves. L. W. S.
Gowanda, N. Y.

Our suggestion is to write the directors of the Southern Experiment stations. You will find them on page 1172. They would be likely to know of any localities where such ditching is being done. The U. S. Government has on hand some experiments at draining land in the South.

"WHAT'S wheat worth now?" "It all depends," replied Farmer Corntossel, "on whether you're raisin' it or usin' it fur food."—Washington Star.

FARM NEWS.

Fifteen silos a day in Texas for the past 12 months is establishing these evidences of prosperity rather rapidly. On September 1, 1914, there were 8,560 silos in the State, and their original cost was $4,520,000. Nearly 5,000 orders were in the hands of manufacturers for silos to be established before the close of the present year. Two-thirds of those already established were built during the past year.

A great rat hunt was the diversion of the farmers at Findlay, Ohio, recently when they made a record of 23,938 rats killed. The Nimrods were divided in two parties and the penalty imposed on the losing side was to furnish a banquet for the side with the larger number to their credit. Boys and men entered the game enthusiastically. A suggestion for the agricultural colleges is to establish a "Swat the rat" day along with "Swat the rooster" and other days deserving of enthusiastic celebration.

The California olive crop is reported to be one of the largest in the history of the State, being 85% of normal crop. It amounts to about 15,000 tons, and is worth $2,000,000. This is easily the largest crop since 1911. The foreign olive crop is light in some sections and heavy in others, and considerable damage has been done in the Eastern Hemisphere in localities by the olive fly. Harvesting will commence in Southern California the last of October and farther north a little later.

With market in Germany for American apples shut off, and with that in England seriously curtailed, the situation demands that growers pack and handle fruit for markets in such condition as to prevent deterioration, pack only No. 1 fruit, and divert other fruit to the cider mills and evaporators. The apple situation was discussed recently by the committee on Fruit and Agriculture of the Boston Chamber of Commerce. Here it was shown that the retail dealer can buy No. 1 apples for from $1.75 to $2.25 a barrel, which only means a small return for the producer. The fixed charges against each barrel of apples, it was found, amount from 18 to 25 cents; cost of barrel, 36 to 42 cents; cost of packing 25 or 30 cents; delivery to car average 10 cents; freight 25 cents; wholesaler's commission 20 cents; cost of cartage six cents, and jobber's profit 25 cents, making the fixed charges against each barrel range from $1.45 to $1.58. At present prices in Boston, the returns for a barrel of No. 1 fruit are only about 50 cents a barrel for first quality, and only the best grade of fruit can be offered if the demand is to be stimulated.

It has been found in Wisconsin that onion smut may be easily controlled by use of a formaldyhyde solution in the drill. Danger in loss by cabbage diseases, particularly yellows, has been reduced by breeding up a strain which when planted on diseased land, produced a fine crop of healthy marketable cabbage. This was done by keeping for seed plants which were able to withstand the attacks of the parasite. From such seed a 98 per cent. crop has been produced when planted on soil on which ordinary seed did not produce more than five per cent. of a crop. The disease-resistant strains, together with careful seed disinfection, will increase the yield and encourage growers to increase their acreage.

LAWYER: "Your wife must be at the trial. A weeping woman is very effective with a jury." Prisoner: "But I'd have to choke her to make her weep! And that might sour the unmarried jurors on me!"—Daily News.

Get The Hidden Treasure From Your Stump Land

Every stump on your farm takes up from 100 to 400 sq. ft. of *rich ground* that would be yielding bumper crops. Take out the stumps! New land often yields $200 to $300 profit the first year.

GRIFFIN LUMBER CO., Box 99, Hudson Falls, New York

YOUR wife—your family—*must* be the first consideration in buying an automobile. When the car drives up to the door and the neighbors notice the new acquisition to the family, it's half the joy of life to hear them say, "What a beautiful car—that isn't the common kind—I wonder what make it is."

If *you* hear it—and *she* hears it—there are a couple of joyous thrills running up and down two spines. YOU KNOW IT.

But your part—the man's part—is to see that beauty is not skin deep.

It's your part to see that under the hood there is an engine that is a *real* engine; an engine of power; an engine of stamina; an engine of long life.

$1250

1915 Mitchell LIGHT FOUR

And it's *your* part to know that the construction of the car means "safety first" to every member of the family. It's your part to have such confidence in the mechanical construction that you *know* when you begin your journey, whether it be long or short, you will come back just as you started.

Beauty—comfort—safety—speed—long life—freedom from engine worry—gasoline economy—*all* the modern conveniences—such as vacuum feed, power tire pump, the latest word in silent starters—two unit, three point construction—one man top—these are a few of the things you should have in your new car.

And you get them in the new Mitchell 1915 masterpiece—and at a price that staggers other automobile makers.

John Bate's engineering skill is at its best in the new models. He has made this a Mitchell year.

The factory is working to its fullest capacity to supply the demand. If you contemplate buying a car now or later, you should see the new Mitchells *first*.

Your dealer can demonstrate their exclusive features to you—or, you can read about them if you write for Mitchell Book No. 121

EVENTS OF THE WEEK.

DOMESTIC.—A cave-in at the American Davy Zinc mines, Webb City, Mo., October 1, caused the death of 12 men.

C. F. Crecelius, Secretary of State for Kentucky was indicted on three counts by the Franklin County grand jury, Oct. 1, for obtaining money under false pretenses and farming and selling State offices. It is charged in the indictments that Crecelius employed a new stenographer at $100 a month and drew that sum from the State while he only paid the stenographer $25 a month. It is alleged that he sold to one of his clerks a position for $800.

Twenty persons were injured at the Interstate Fair at Trenton, N. J., Oct. 2, when an automobile, driven by Jack Le Cain in the twenty-five mile race, crashed through a fence into the crowd. Le Cain was rounding a turn when his rear axle broke. He was thrown out when the machine struck the fence, but the automobile plowed on through the crowd.

Five persons were killed and seventeen injured in automobile and motorcycle accidents in New York and vicinity, Oct. 4. Of the injured four were reported to be in such serious condition that the day's death toll probably would reach nine.

Jamaica Bay oystermen, who have been forbidden by the New York Board of Health to raise oysters in Jamaica Bay, L. I., on account of its proximity to a sewer, are interested in a $100,000 damage and injunction suit, Oct. 5, against the city before Justice Maddox in the Supreme Court, Brooklyn, by George A. Carman of Canarsie. He says that before the Board of Health acted he made $5,000 a year from the oyster beds. Several other oystermen have brought suits against the city on the same ground, and if they are successful the city may have to pay $1,000,000.

Sixteen men are known to be dead and twelve injured as the result of a pocket gas explosion, Oct. 5, at the Mulga mines of the Woodward Iron Company, near Ensley, Ala. Mine officials state the explosion was purely local and was caused by striking a pocket of gas. Mulga mines had a previous explosion on April 20, 1910, when thirty-five were killed.

T. E. Stokes of the United States Department of Agriculture, who recently came to Kentucky as State agent of the Boys' Pig Clubs, has been looking over the field in that State, and it is possible that Woodford will be chosen as one of the counties in which the organization of the pig clubs will be undertaken. The object of pig clubs is to stimulate an interest in swine production and to teach farmer boys how to raise better and cheaper hogs by use of improved blood and the growing of forage crops; to complement the work of boys' corn clubs by showing the boys how they can profitably sell their corn through hogs.

In conformance with a vote of the New Haven Railroad directors last July, the railroad, Oct. 6, began a suit for the recovery of $3,900,000 against John L. Billard of Meriden, a former director; Edward D. Robbins of New Haven, former general counsel; Samuel C. Morehouse of New Haven, who acted as assistant attorney to Robbins; Charles F. Linsley of Meriden, Henry Whipple of New Haven and Samuel Hemmingway, the New Haven banker, who formerly was on the board of directors.

THE EUROPEAN WAR.—The battle of the Aisne, nearly at the end of the fourth week of consecutive fighting, was still bitterly contested, Oct. 7-8, both sides claiming gains in certain areas. .....The Germans continued their attack on Antwerp, Oct. 7-8, and it was reported that the fall of several fortresses would necessitate the capitulation of the city. All noncombatants had been warned to leave several days previously, and the seat of government had been moved to Ostend.....Hard fighting continues between Russians and Germans in Galicia, while in Hungary the Russians are only six hours by rail from Budapest.....Oct. 7 the British submarine E-9 sank a German destroyer just off the mouth of the Ems.....The British Admiralty has warned all shipping that it is now laying mines in certain areas in the North Sea.....Papeete, Tahiti, belonging to France, and the British cable station on the Fanning Islands, North Pacific, have been bombarded by German warships..... There has been further loss to shipping from mines in the North Sea and Adriatic. The French fleet is now laying mines in the Adriatic, but has announced the danger zone.....Japan continues hostilities in China; it is reported that the bombardment at Tsing-Tao has wrecked a German cruiser. One Japanese mine-sweeper has been destroyed by a mine. Japan has seized Jaluit, in the Marshall group between Hawaii and the Philippines, for temporary strategic reasons.

Corn, old, $1; new, no price. Wheat $1.05; oats 60; potatoes $1.20; hay $15; straw $7; sheep four to five cents per pound; hogs, fat 9; stock 8; cattle 6 to 8; horses $100 to $200 each. Corn crop about 50%; wheat 80%; oats 50%; hay 50%. Stock of all kinds rather scarce. A good many farmers are putting up silos and going into the dairy business. F. L.
Albany, O.

CROP NOTES.

Sept. 28. The season has not been as favorable for crops, due to excessive rains in June and part of July, and later very hot and dry. All small grain grew very rank and a good deal of it lodged badly; black rust struck our wheat and affected oats also, cuting both quality and quantity from what it might have been under more favorable conditions. No. 1 wheat 99; oats 39; rye 79; barley 44; corn 65. Live hogs around 8 cents a pound; fat cattle from 6 to 7. Common cows from $40 to $75; butter 30; eggs 22; hens 8; broilers 1½ to 2 pounds, 11. Fruit is little raised here, and very little sold; no market gardening done. Hay plentiful and cheap, wild hay selling at $4., tame hay $6. Horses from $100 to $200 each. G. A. Q.
Clearwater, Minn.

Sept. 23. Old chickens 12; young, 13; roosters 5; eggs 23; butter 23-25; lard 10; potatoes 75. Cattle 7 to 8; calves 8 to 8½; sheep 4 to 6; spring lambs 7; hogs per 100, 9; hides 12½; tallow 5; wheat $1; corn $1.03 per 100; oats 43; rye 80; clover seed $8; Alsike $7; clover $12 to $15; timothy $15 to $18; horses $100 to $300 as to quality; good drafty brood mares command fabulous prices. Good dairy cows bring $50 to $150 as to breed; grade Holsteins sell at $100 to $200. This is a diversified farming country, wheat, oats, corn, hay and tobacco; nearly every farmer raises four to 10 acres of Spanish or Seed leaf. Buyers are offering 10 cents per pound for Spanish. No prices offered for seed yet, the tobacco crop was universally good through here, of extra quality, and all housed before any frost, in fact no frost of any consequence to present time except in very low grounds, such as marsh low land. The wheat crop is being sowed and a few fields greening over, no fly noticed yet, but chinch bugs are in cornfields and very numerous. A few fields of corn damaged very badly by them, and farmers are sowing wheat in these fields late hoping freezing will keep the insects from injuring the crop.
Ansonia, O. A. L. W.

Cass County lies about 200 miles north of St. Paul, near the center of the State east and west. It is mostly on cut-over country abounding in beautiful lakes and Itaska Lake, the source of the great Mississippi, is only a little way to the west of us. We have a healthful and delightful climate, especially in Summer, and hundreds of pleasure-seekers come here every season. Fish and wild game and even bears are plentiful. Not one-tenth of this county is yet developed, and lumbering is the chief industry. This is the land of the big Red clover, and dairying is coming to the front. We have numerous natural meadows where all kinds of grasses abound. Our Winters are rather long but are generally mild, with little wind. Speculators hold by far too much of the land but many new settlers are coming in and opening up farms. General prosperity and contentment prevails. The farmers are intelligent and nearly all belong to some club.
Pine River, Minn. J. W. W.

COMING FARMERS' MEETINGS.

National Apple Day, October 20.

National Dairy Show, Chicago, Ill., October 22-31. The following meetings and conventions will be held in connection with the show: American Association Creamery Butter Manufacturers, Oct. 26. Holstein-Friesian Association of America, Oct. 26. International Milk Dealers' Association, Oct. 26 and 27. Conference, Secretaries of State Dairymen's Association, Oct. 27. Official Dairy-Instructors' Association, Oct. 27. National Dairy Union, Oct. 28. American Dairy Farmers' Association, Oct. 28. Council of the National Dairy Show, Oct. 28. National Association of Creamery Managers and Owners, Oct. 28. American Jersey Cattle Club, Oct. 28. National Association of Ice Cream Manufacturers Oct. 28, 29 and 30. International Association of Dairy and Milk Inspectors, Oct. 29. American Guernsey Cattle Club, Oct. 29. Congress of Marketing, Oct. 29. Milk Producers' Association, Oct. 30.

New England Fruit Show in connection with the Rhode Island Fruit Growers' Association annual meeting, in Providence, R. I., November 9, 10, 11 and 12; secretary, A. M. Parmelee, Norwood, R. I.

National Grange, annual meeting, Wilmington, Del., November 11-14.

Maryland Week Exhibition, State Horticultural Society, Maryland Crop Improvement, Dairymen's and Beekeepers' Association, Baltimore, November 16-21.

Annual Show of the Paterson, N. J., Poultry, Pigeon and Pet Stock Association, November 18-21.

Indiana Apple Show, Tomlinson Hall, Indianapolis, Ind., November 18-24.

Western Connecticut Poultry Association of Danbury, Conn., Inc., nineteenth annual exhibition, Hull's Armory Hall, Danbury, Nov. 26, 27, 28; secretary, Thomas Deans, 39 Hoyt St., Danbury, Conn.

Second annual seed exposition, Montana Seed Growers' Association, Bozeman, Mont., December 8-10.

Farmers' Week, Pennsylvania State College, December 28, 1914 to January 2, 1915, State College P. O., Penn.

January 9th to 15th, inclusive, 1915. Mid-Winter Exposition, State Fair Grounds, Columbus, Ohio, Corn, Apple, Dairy and Poultry Shows combined.

ANOTHER "MAKING MONEY" STORY

Getting Cash Dividends out of Wood Lots and Spare Time

By A Real Farmer

(Name on Request)

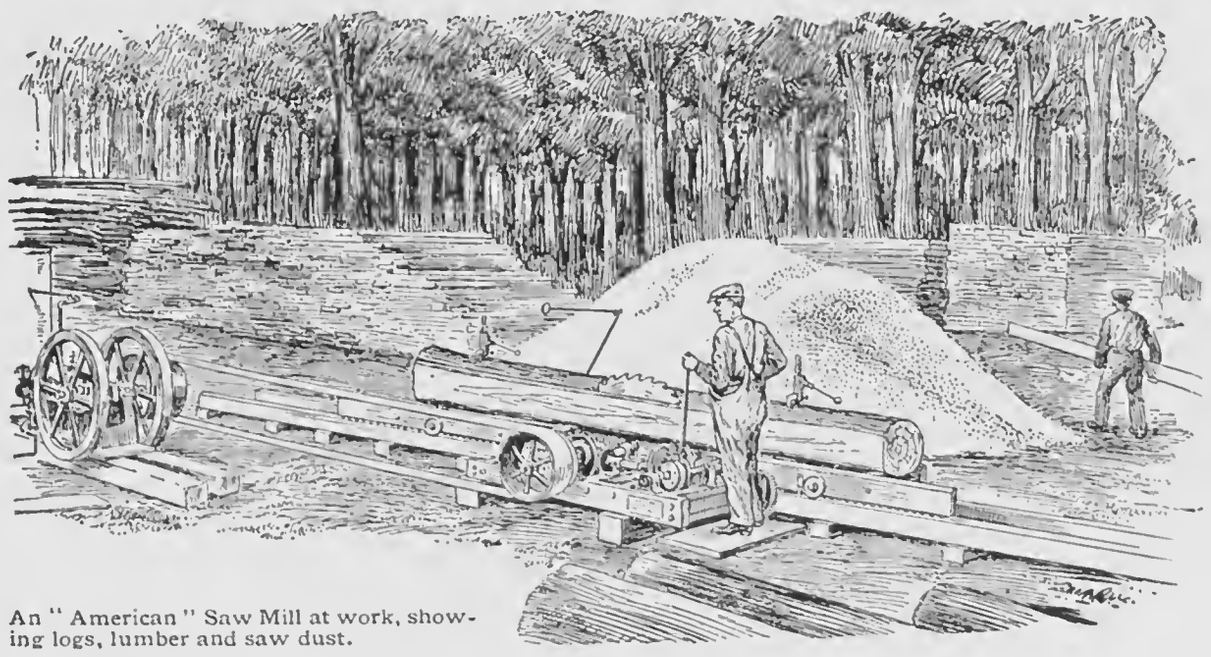
A few miles back from the Hudson in the country made famous by Cooper and Irving, a wide-awake farmer is making winter a harvest-time. With his farm engine, an "American" saw mill, and farm help, he is sawing a profitable lumber crop out of his wood lot and those of his neighbors.

If you wish to verify any statements in this story, or to know what he thinks about "American" saw mills, he will be very glad to answer your letter. His name and address may be obtained by writing the American Saw Mill Machinery Company, Hackettstown, N. J.

HOW can a farmer make more money in the winter? That's a question I scratched my head about many a time, until one day last fall I got hold of a book. It was about "American" portable saw mills and told how lots of farmers were making winter a harvest-time with these mills. It said that any farmer who had a wood lot could make money sawing his trees into lumber with a light, portable "American" mill, his farm engine and his farm help.

Well, I got one. She worked fine. The boys got the hang of it quick and pretty soon we were making lumber for the neighbors. They brought their logs to the mill on sleds from as far as six miles; paid me $7.50 a thousand for sawing; and took away the lumber. The mill turned out 4,000 feet a day. The labor cost $6.50, with $2.50 extra for gasolene and oil. My profit on a day's work was $21. On small jobs I used my own farm help, so labor was cheaper, but a steady job paid me to hire a sawyer at $3.00 a day and two helpers at $1.75 each. I always kept the slabs, too, worth $2.50 a cord as firewood. Between times, I made myself new planks for the barn floor, and sawed out of one tree enough lumber for two wagon-boxes for about $7, including carpentering, and better than I could buy for $10 apiece.

I sawed and sold my own lumber as fast I could get it out of the woods. The local wheelwright paid me $120 for 2,000 feet of white oak for wagon purposes and over half was profit. I got a contract to supply planking and stringers for bridges from the Town Superintendent. Then came the big deal which not only paid for my saw mill, but my 12 H. P. farm engine and a shingle machine to boot, and left me $400 clear profit.

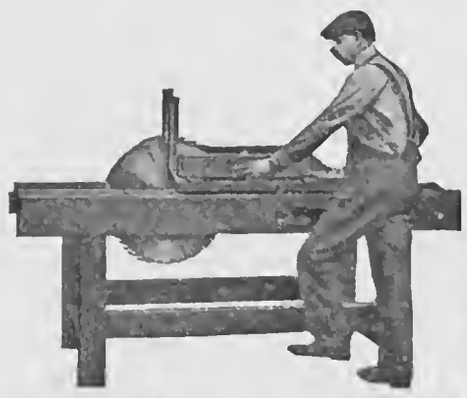


An "American" Saw Mill at work, showing logs, lumber and saw dust.

A neighbor of mine was building a big barn last spring—about 100x40 feet with 20-foot posts and a basement big enough for 100 cows. I furnished all the lumber for that barn except siding, doors and window frames. I got the order because I could afford to sell good chestnut from off my place at the same price the lumber dealer asked for spruce or hemlock, and I could saw the exact sizes wanted. In two weeks' time my little "American" mill sawed out 40,000 feet of chestnut for that barn, bringing me $40 a thousand—$1,600 for the job. Besides that I made and sold all the shingles at $5.50 a thousand. Of course, I won't get a big job like that every day, but it shows what a farmer can do to make money in the winter. Now I have my saw mill outfit paid for twice over, and good for many a winter to come.

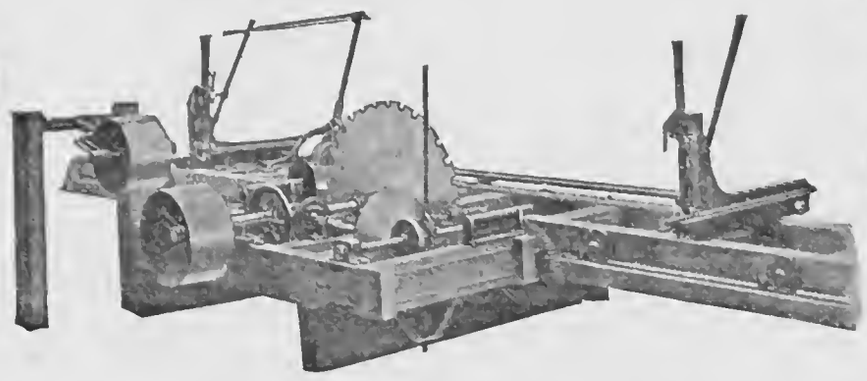
Every farmer needs an "American" saw mill. It's as necessary as a silo. On all kinds of odd jobs where lumber is needed you can save money. If a barn burns down, you can save enough money sawing lumber for a new one, to pay for a saw mill. Your neighbors will buy your lumber at retail prices. I even sell to carpenters and builders, and will sell more as soon as I get an "American" Jewel Planer for finishing up rough lumber. I tell you what, I'm enthusiastic about "American" Saw Mills and I have good reasons. The Company will give you honest advice and they can make quick delivery so you can get busy at once. Don't wait. Start now.

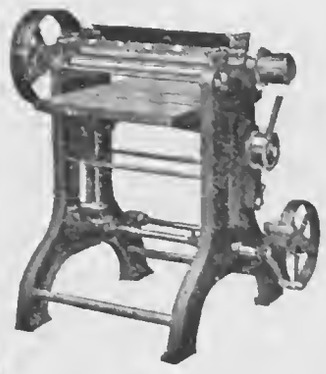
Send in your order and then start to cut and haul your logs before the mill comes, so you can start to make money right away. Any farmer can make money with "American" mills.



With an American "Up-To Date" Shingle Machine you can make 5,000 to 10,000 shingles per day with 4 to 8 H. P.

The illustration below shows an "American" Standard Variable Friction Feed Saw Mill for farmers. It is a plain, simple, strong machine—light and easy to move around. Requires no experience to run. Guaranteed, of course.





With an American "Jewel" Planer you can make and sell finished lumber. It is specially adapted to farm use.

The "DUPLEX" DRIVING LAMP

was made for the new State law. The "DUPLEX" has these advantages over every other old style driving lamp:

1. It is small and light. 2. Can be attached to either side of the dash. 3. Strong white light ahead, brilliant red light to the rear. 4. Fine quality concave white lens in front. 5. Special coral fresnal red lens in rear. 6. Positive catch on door—lamp cannot spring open. 7. Oil fount is contained in case of lamp and cannot work loose or drop off. Burns kerosene. 8. Simple to light—very simple to keep clean. 9. Made so that it won't rattle or work loose. 10. Guaranteed windproof—cannot blow out or jar out. 11. No solder to melt. 12. Nine inches overall. 13. Handsomely finished in black enamel and nickel plated brass trimmings. 14. Retail price is only $1.50. 15. Cost you 50c to a dollar less than the ordinary old style lamp. 16. Made especially for you. Your dealer has the "Duplex" in stock. If he has not got his stock yet, write us direct for particulars. Better write us anyway for copy of the New Law—this will be sent you without any charge whatever.

WHEN TO TRIM PEACH AND PEAR

HOW soon after fruit is gathered is it safe and prudent to trim up, cut out limbs, and generally fit and shape peach and pear trees for the next year? This question refers to Western New York, or the strip along the Lakes. Just how soon after picking would you consider it safe to begin on the trees?

I have had best results in trimming peach trees in Spring, March or April; with pears any time in the Winter months. We harvested about 7,000 bushels of Bartlett pears this season and 1,200 bushels last year. Peaches were a failure, the first time in 16 years.
WILLARD HOPKINS & SONS.
Niagara Co., N. Y.

The notion is rather widespread that it is desirable to prune peach trees soon after the crop has been harvested. The practice of pruning at this time comes from the old world, especially from England, where late Summer pruning is often recommended, and is probably necessary in the cool, damp, English climate so that air and sunshine can better reach all portions of the tree and assist in ripening the young wood. In such pruning the old wood is not cut but the work consists of pruning out and training the young shoots leaving mature wood until Winter. In America this late Summer pruning of the peach is little or not at all practiced by commercial peach growers, and even those who are growing peaches in private gardens, where it is possible to train and prune with more particular care, seldom trim their trees at this season of the year. Indeed, sometimes it is unsafe to do so, for if such a burst of Summer weather as we are having in New York at this writing should follow, a very undesirable second growth might appear. The time to prune the peach in this climate, then, is, with almost no exceptions, when the wood is dormant. It matters little after leaves drop and before they come the next Spring as to when the pruning is done, though there is a current prejudice that peach trees should not be cut until late Winter, because of injury from cold. Large peach growers, however, find it necessary to begin the work in early Winter, and do not report injury from freezing or from checking.
U. P. HEDRICK.
Geneva Exp. Station.

The largest fruit growers around Hilton commence in December and trim on mild days all Winter. If I had but two trees to trim I should prefer to do it in March. I should not trim till the leaves had dropped; should not think it safe to do so. DELOS TENNEY.
Monroe Co., N. Y.

We have found it safe to trim peach trees at any time after the growth of the tree has stopped. This is indicated by the leaves turning yellow and commencing to drop. We usually begin as soon as the Fall harvest work is finished, about November 1. F. W. CORNWALL.
Wayne Co., N. Y.

In regard to the question of trimming peach and pear trees, trim any time after the fruit is harvested.
Orleans Co., N. Y. JAY E. ALLIS.

We always leave our trimming until about mid-Winter. The reason for this is that it is always possible, especially with peaches, in case of a hard freeze, that a certain growth of wood may freeze. If you trim early you of course trim it as you wish it to start next Spring. When the cold weather comes after that and freezes it back another foot the tree has to be trimmed again, and you are taking off more than you want. My experience is that we are apt to have our extremely severe weather usually by the end of January, and a few years ago, in talking with Mr. King of Trumansburg on this subject, I understood him to say that they began trimming about the first of December, but they began early, as they had so much to do that they were obliged to begin then in order to get it finished before Spring, with the experienced men they wish to do the work. If I remember rightly he expressed a preference for the later trimming, but feels forced because of the facts stated. While I have never practiced Summer trimming I cannot help but feel that for peaches especially it would be a good thing. This will of course tend to the formation of fruit buds lower down on the tree, whereas the majority of buds appear on the present season's growth, and sometimes severe trimming will remove more fruit buds than is desired. Except for the danger of freezing back I cannot see any reason why a fruit tree may not be trimmed any time of the year after the first quick early growth is about over. I might add that it has seldom occurred in the past 30 years that in my location I have seen it sufficiently cold to freeze back the trees. W. L. MC KAY.
Ontario Co., N. Y.

"I SUPPOSE," said the candidate "that I can depend on your support?" "I dunno," replied Farmer Corntossel, in a low tone. "Mirandy an' the two girls are hangin' out o' the window, over the porch, tryin' to hear what we're talkin' about. I want to support you, but you'll make it easier fer me if you'll sort o' get agitated as we walk toward the gate an' holler, 'Votes for women!' a few times."—Washington Star.

DIRECT FROM THE MILLS $8 SWEATER COATS $5

Men's and Ladies' $8.00 Jumbo and Shaker sweatercoats, hand knitted from the very heaviest and finest quality pure wool yarn.

Sent direct to you from the Mills, all charges prepaid for $5 with the distinct understanding that you may return it after 10 days trial and receive your money back, if it is not absolutely satisfactory.

State color, size and style when ordering.

Is "Bossy" The Boss?

On a great many farms she is. We mean, of course, the cow that eats her head off and lets down as much milk as suits her. Each cow like this is boss, for you work for her and not she for you.

Is She Yielding Maximum Profits?

Don't be satisfied with even moderate results. Study the proposition. All successful dairymen do. We urge you by all means to read Mr. V. E. Fuller's book, "Feeding Cows for Profit." It is simple and concise and discloses principles of feeding which will

Put Your Dairy On a Sound Business Basis. Mr. Fuller shows rations which he has used with great success as the confidential feeding expert of the greatest dairy herds in this country. When cows fall off in milk, Mr. Fuller is called upon. He mixes rations that bring them up. The results of his many years of feeding experience are in this book. It's worth many times the price we ask. Here is your great opportunity of securing it:

For Only $1 We Send You

"Feeding Cows for Profit"
and the
Farm Journal for 4 Years

Either Alone Is Worth It!

The regular subscription price of the Farm Journal is $1 for five years. A single issue is worth that, so subscribers often write. The first edition of the book sold for $5.00 per copy—yet for $1 you get the book and the paper for four years! The first edition was immediately exhausted by those who knew Mr. Fuller and his work. Fortunately we secured the rights to reprint it for Farm Journal folks. The only difference in the book is that ours is bound in paper covers and his in leather. All the original matter is there and more, too, for Mr. Fuller has added some feeding formulas just for "Our Folks."

Guarantee We guarantee to refund the full amount of the subscription price of the Farm Journal if the subscriber notifies us within three months after paying for it to stop the paper. We give you this guarantee because we know you'll be delighted with the Farm Journal. It is "unlike any other farm paper."

VAN DEMAN'S FRUIT NOTES.

ORCHARD QUESTIONS.

WHAT kinds of soil are best suited for the different tree fruits? 2. What system of laying out an orchard is to be preferred? 3. Should orchards be plowed deeply? 4. Has salt any value as a fertilizer for fruit trees?

Richmond, Va. W. N. W.

1. As a rule the heavier or clay and shaly soils are better suited to the growth of apple and pear trees and the sandy soils to the peach, plum and cherry. But the apple, pear, plum and cherry also do well in the sandy lands when they are well enriched and tilled.

2. There are various good systems of laying out orchards, but that which my experience and observation of over 50 years has taught me is the best is the plain square system, especially if the plan of using temporary trees as fillers is followed, and I like it very well. There is the objection to it that the average fruit grower dislikes to, and often will not, cut out the fillers when they begin to crowd, but this is positively necessary and should be done at all hazards. Otherwise damage will be done to all the trees, and the permanent ones will never entirely recover from even a year or two of crowding. The distance I have found to be the best for setting apple trees with the fillers in is 25 feet apart. At first I tried 16½ feet in Kansas but that was so close that it did not give time enough for the fillers to do their full duty. Then I tried 20 feet and that was too close, so I have since planted 25 feet apart and with good results. By cutting out half of the diagonal rows the trees left will be about 35½ feet apart, which in some climates and soils is sufficient distance for full development of the trees, and no further thinning out is needed, but in the best apple soils it is not. In such cases it is necessary to dig out one-half of the remaining trees by removing all in each alternate row running squarely through the orchard, which will leave the trees 50 feet apart and give ample room for full development and I have seen many apple trees that needed that much room. In no case would I plant peach tres as fillers, because they are sure to injure the apple trees to some extent by their more rampant growth. They need different culture and spraying from apple trees and should be in an orchard by themselves. Same is true of about all fruit trees in various degrees.

3. Orchards should be plowed deeply while the trees are very young and always cultivated shallow, and as the roots extend into the soil the plowing should be shallow where they are. It is better to plow deep in an orchard than not at all, but it is an injury to break the roots and the greatest care should be used to watch the mark and know what the tools are doing to them. Frequent and shallow cultivation is the right plan to follow in an orchard of any kind.

4. Common salt has no value as a plant food nor in any other way for fruit trees in the soil. It is soda and chlorine, and contains no potash or other ingredient that is used in fertilizing.

The Muscatine Grape.

YEARS ago, when a boy in Eastern Massachusetts, we had on our place a particularly fine flavored white grape, which was known as Muscatine or Muscatel. I am at present setting out fruit on my place in New Jersey and am anxious to get some of the above variety, but up to date have been unsuccessful in locating it. Can you help me?

Mountain View, N. J. H. C. L.

The name Muscatine is very commonly used as a popular one for the species of grape that is native to our Southern States, and botanically known as Vitis rotundifolia, and is sometimes applied to the variety of that species called Scuppernong. "Muscatine" and "Muscatel" are names that have been used for some varieties of the European species V. vinifera, but they are quite unsuitable to Massachusetts and could hardly be the same referred to by the inquirer. But there are several very excellent white grapes that are suited to that region, of which the Winchell is one of the very earliest and sweetest. It is also called Green Mountain. The Duchess, Triumph and Niagara are other white grapes of good qualities of fruit and vine.

H. E. VAN DEMAN.

LEGAL FARM MATTERS.

Enforcing a Contract.

A BUYS a farm, makes a trade with B to carry on the farm for one-half net proceeds, A furnishing team, tools, one-half fertilizer, one-half of packing cases or barrels for shipping. B having no ready money, A offers to furnish all of the above and expense money for living until crops are turned off. A having died about two months after the trade was made, his wife and his brother agree to carry out his part of the trade, if B would continue his contract. A and B having been close friends, B agreed to do so, while A's wife and his brother did not continue to do so, even disposing of team before B could harvest a crop of watermelons, also corn land plowed ready to plant, except fertilizer. B was to stay on the place for a year, but had to leave on account of not having living furnished and in fact nothing was furnished after a few weeks. B claims $500 damage; there were no papers to show the contract. A witness was called in. Can B collect damages? W. H. R.

Florida.

Everything here depends upon questions of fact, which B will endeavor to show are in his favor, and the wife and brother of A will as surely endeavor to prove are favorable to them, and it will be a question of whom the court believes. If even the essentials of this contract had been put in writing, how much easier of proof it would be for all parties and how much less chance for misunderstanding. The wife and brother will claim that B did not stay on the land for a year and so did not fulfill his contract. On the other hand, B will claim that the actions of the wife and brother made it impossible for him to continue with his contract, and from the letter this appears the more correct, and it would seem as if B had a claim for damages against the wife and brother for the breach of contract: but, as stated above, it all sifts down to questions of fact, which must be proved by interested parties without the aid of any written instrument. If a friendly settlement could be arranged, it certainly would be the best way out. M. D.

Hackman's License.

WHEN a man has a license to operate his own automobile, can an incorporated village impose a license for "hacking" within the village limits, that is to take passengers to and from trains, handle freight, etc.? E. V. F.

New York.

The law gives the board of trustees of villages power by ordinance to prohibit the running of public hacks within the village without a license, and the village has full power to give or withhold a license for good reasons. M. D.

"IT appears," said the magistrate, "that you stole seventeen pounds of butter. It was found in your possession and identified positively. You have not accounted satisfactorily for it, and there is no doubt whatever in my mind that you are guilty. I shall send you to prison for one month." "Your worship," protested the prisoner, with tears in his eyes, "can't you make it fourteen days? The stuff was only margarine."—London Farm and Home.

Order Sunlight Double Glass Sash—NOW

The J. Weller Co., Cincinnati, O., the famous canners, ordered first in 1911. In 1912 they wrote: "We will buy more this winter." They did. Also more in 1913 and 1914.

No More Mats and Shutters

Extra thick, of cypress, everlasting, double-glazed with an air space that admits the sun, but not the cold, this sash has rendered the old style single layer sash obsolete. It eliminates mats and shutters cutting the cost one-half and doubling the efficiency in the garden.

Get Our Catalogue

Our free catalogue explains everything in detail both about the sash and the Sunlight Greenhouse on which the sash are also used. It is inexpensive, attractive and a highly profitable addition to any garden.

If you wish it, enclose four cents in stamps for a copy of Prof. Massey's booklet on the use of cold frames, hot-beds and small greenhouses.

SUNLIGHT DOUBLE GLASS SASH CO.

The Tires Men Want

You'll Be Glad When You Get Them

You don't know what you miss—you men who are buying other than Goodyear tires.

All this sturdiness, this safety, this trouble-saving—you are bound to demand it sometime. Why not in the next tire that you buy?

How They Excel

It is evident that Goodyear tires excel. They hold top place in Tiredom—outsell any other. And none but the best tire built could do that, after millions have been used.

Their advantages are these:

The No-Rim-Cut feature—which we control—makes rim-cutting impossible. Tires which rim-cut mean enormous waste.

Our "On-Air" cure—used by us alone—ends a major cause of blow-outs. This one exclusive process costs us $450,000 per year.

Our rubber rivets—formed by a patent method—reduce by 60 per cent the risk of tread separation.

Our All-Weather tread—used on Goodyears alone—is a matchless anti-skid. It is tough, double-thick and enduring. It is flat and regular, so it runs like a plain tread. It grasps wet roads with deep, sharp, resistless grips. No wheel should be without it.

Say That You Want Them

Say to your dealer that you want Goodyear tires and you'll get them. Then your major tire troubles will be wiped out or minimized. Hundreds of thousands have proved this, and have adopted this Goodyear tire. You'll be glad when we get you to join them.

Hope Farm Notes

APPLES AND IDEALS.

I HAD a call a few days ago from a friend living in Rochester. He found me in the orchard picking a few apples. He was so impressed by their beauty and excellence that he bought a barrel and had it shipped by express to his family in Rochester. H. V. D. R.

Amenia Union, N. Y.

WESTERN SPIRIT.—This is merely renewed evidence of what I have always claimed, that the Hudson Valley fruit region can and does produce the most beautiful fruit that comes into market. This fact is not generally known. So much has been said about the wonders of fruit growing on the Pacific Coast, and about the immense orchards of Western New York, that the Hudson River growers have been content to remain quiet and let others do the talking. They make a mistake in this, for the Valley is really a wonderful fruit section, and its advantages and possibilities ought to be advertised. At the big fruit meeting in Poughkeepsie last Winter, the Hope Farm Man gave a little talk on "Ideals in Horticulture." There have been a number of requests for a copy of what he said regarding this matter of advertising the section. He spoke of the spirit which is found in many of the Western towns and cities toward those who excelled in fruit growing. Let a man from that region go to a big fruit show and win a prize for beautiful fruit, and when he comes home he finds the whole town lined up to meet him with a brass band, and all the notables present. This spirit is a wonderful thing for Pacific Coast fruit growing, because it gives all people, old and young, the true thought that their own produce should be the best of all, and that they should all strive to make it so. After stating this, the Hope Farm Man went on to talk about as follows:

GLORY.—During the Spanish War this part of New York State sent a company or a regiment of soldiers to the front. It is very doubtful if these young men ever saw a Spaniard on the battlefield. Quite likely they never fought anything fiercer than a malarial mosquito in the recruiting camps of Florida and Tennessee, yet their spirit was true. They willingly offered their services and their lives to their country, and when they came home, very properly the main street of Poughkeepsie was one mass of color. Your factories were closed for the time, and all your people turned out to welcome those boys back home again, because they had upheld the honor of the Hudson River, and offered the best they had for their country.

BASEBALL.—I read not long ago of a baseball player who took part in the famous world's series. I cannot tell you how many men he struck out as a pitcher, or how many runs he made, but he was a great man, because he did something which appealed to popular feeling. When he went home and stepped off the car, he found lined up in the public square half the population of his home county. The president of a great university made a speech welcoming him home. The leading clergyman, the judge of the local court were there, and the Congressman hurried home from his arduous duties at Washington to show himself before that crowd. This man had done nothing but throw a baseball so that it dodged around a corner and got away from the bat, yet he threw that ball partly for the money he got out of it, and very largely for the glory of the home town. The Congressman said that this young man had put that town on the map by throwing the baseball. At any rate he made an appeal to popular feeling, and society rose up and honored him.

BRUISERS.—In like manner I heard of a prizefighter who went away from home, and succeeded in hammering another human brute into the condition of hamburger steak, winning fame and profit thereby. When he came home his town turned out to welcome him with great applause. He also was told that he had put his home town on the map, and written his name in italics. I could stand here and give you instances by the hour which would show where men, women or children have gone out into the world, done something for the honor of their home section, and returned to be lionized and pointed out as public benefactors. That is the spirit which makes a community worth while. When a man does something to put his home town on the map he ought to be called a good citizen, and honored accordingly.

A PRIZE WINNER.—Now let us see how this works out in the Hudson Valley. A few weeks ago our good friend, J. H. Hepworth, who is known to all, packed his grip and started for Rochester. That grip did not contain dynamite, or boxing gloves, or baseballs, or a fancy dress uniform, but it did contain a bunch of the finest fruit that ever grew on a tree; fair specimens of the best products turned out by the Hudson Valley. Brother Hepworth went up against the best fruit growers in the country. He exhibited his apples at the big fruit show, and won so many first prizes that it wasn't worth while to ask who was second. His Baldwin apples from the Hudson Valley were voted by the judges to be the most beautiful and perfect specimens of that fruit to be found at that great exhibition. You see some men write the name of their home section with a baseball; others pound it into the face of their antagonist; still others shoot it into the enemy, but Hepworth wrote the story of the Hudson Valley in the beautiful colors of your priceless fruit. And in doing so he did more for your section than any man you have ever sent to Congress to do your public work for you.

HOME COMING.—All this was very fine, and of course Hepworth, like the rest of the notables, got his reward. When he started from Albany on his way home down the valley, of course there was a signal fire on eve y hillside. Every time the train stopped, of course there was a brass band, and all the pretty girls in town were out singing "Hail to the Chief Who in Triumph Advances." When he got off the train at his town, of course everybody within gunshot was there to greet him. They put him into an automobile of course, with the old flag flying above it. The Congressman of his district, and the local judge were there, to welcome home this great man who had put the home town on the map. Am I not right, Brother Hepworth, in this? Hepworth shakes his head. But didn't they have the band out? Didn't the school children meet and sing "America?" Didn't they give you the freedom of the city? Hepworth still shakes his head. Didn't the minister on the following Sunday put you right into his sermon, with you up on a front seat listening to the text? *"Well done, thou good and faithful servant."* Hepworth still shakes his head, and says he doesn't know, because he didn't go to church. Then leaving out these smaller matters, when you got home from that glorious victory, didn't you receive a visit from a committee of gentlemen who demand that you run for Congress as a reward for your services? He says that nothing of this kind was done. He simply came home with the blue ribbons stuffed in his pocket. He got off the train and walked up the hill alone, and when he got home he had to explain what had been going on during his absence, just like the rest of us who are common people.

THINK IT OVER.—But seriously, I speak of these things to bring home a point which we must all recognize. Most of us are chasing off into some other part of the country to find heroes or heroic things. Somehow we think that the home town may be a good enough place for the practical working things of life, but when following the ideal or the imagination of life we seem to think that we have to go somewhere else and find it. That is one reason why this good old Hudson Valley has never really come to its own. That is why the world does not recognize the fact that here on these sunny slopes by the side of the river, we are producing the most beautiful fruit, the most glorious specimens of Horticulture, that ever were colored by the Autumn sun, or ever were picked from a tree. Tourists come back from the old world after studying the valley of the Rhine. Travelers come back from California and the Pacific Coast after wandering for hours through the orange groves of that beautiful country, and yet when they stand on the banks of the Hudson in the Autumn, when nature is painting the fulfillment of her promise upon vine and tree, they say there is no fairer valley, no more hopeful section on the face of the earth, and they are right. And if we could have in this valley something more of the spirit which prompts the Western town to applaud those who make her products famous, this valley would become as glorious in song and story as any spot on earth. H. W. C.

Wonderful Shoe Value

HERE is the shoe that is meeting with greatest favor among our many customers. Read this description—note our price—and you'll understand *why*. Heavy unlined black dairy calf Blucher. Full vamps, bellows tongue, heavy wax stitched and nailed, two full oak soles, long outside back stay, leather insoles, counters and heels. Roomy last. Sizes 6 to 12. No half sizes.

No. 7E906, prepaid, price pair $2.35

Lots of sport and there's money in it. FUR NEWS, published monthly, tells all about trapping, hunting, raw furs, fishing, hunting dogs, guns, ginseng, fur farming, woodcraft, and all pursuits for profit in forest and field. Lots of good stories. SPECIAL OFFER: Send 50c for one year's subscription to FUR NEWS and get FREE valuable 64-page Trapper's Guide. FUR NEWS, 75 W. 23d St., N. Y.

LET US TAN YOUR HIDE.

Cattle or Horse hide, Calf, Dog, Deer or any kind of skin with hair or fur on. **We tan and finish them right**; make them into coats (for men and women), robes, rugs or gloves when ordered.

Your fur goods will cost you less than to buy them, and be worth more. **Our illustrated catalog** gives a lot of information which every stock raiser should have, but we never send out this valuable book except upon request.

It tells how to take off and care for hides; how and when **we pay the freight both ways**; about our sale dyeing process which is a tremendous advantage to the customer, especially on **horse hides and calf skins**; about the fur goods and game trophies we sell, taxidermy, etc. If you want a copy send us your correct address.

The Crosby Frisian Fur Company,
571 Lyell Ave., Rochester, N. Y.

Handy Binder

JUST the thing for preserving files of The Rural New-Yorker. Durable and cheap. Sent postpaid for 25 cents.

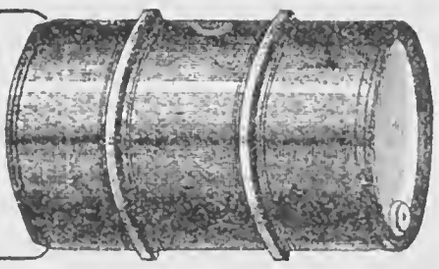
Elite Burning Oil
In Wood and Iron Barrels

A perfect burning oil made from Pure Pennsylvania Crude.
25 Years on the Market
Write for Particulars and Prices
DERRICK OIL CO., Titusville, Penn.



A New Dust-proof Bearing Perfectly Oiled

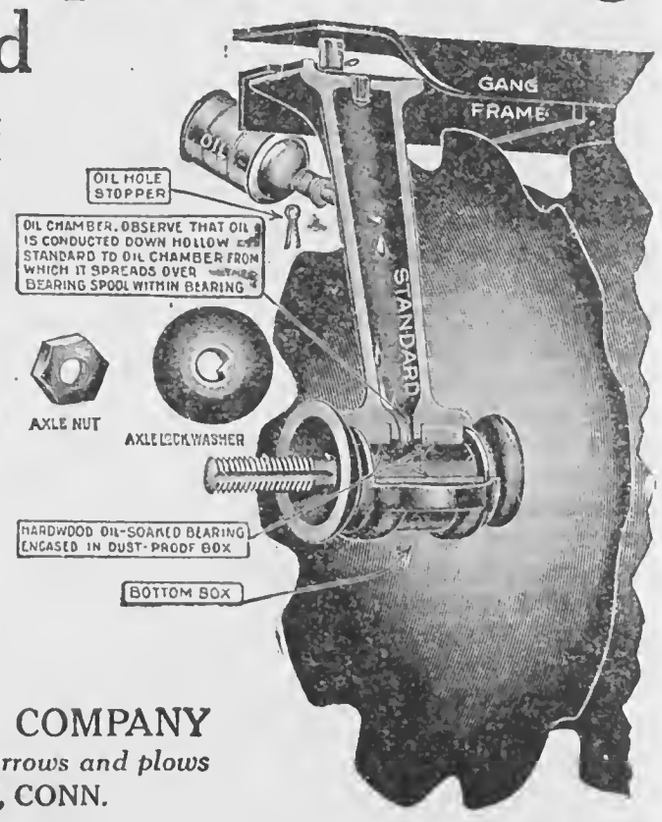
Here is an improvement that tells in still another way of durability, efficiency and light draft found in the

Cutaway (CLARK)

Disk Harrows and Plows

The illustration in this announcement shows how our hardwood oil-soaked bearings are now encased in metal dust-proof boxes; and how the oil is conducted inside of the bearings. Could it be simpler? Could it be improved?

Ask your dealer to show you a CUTAWAY (CLARK) disk harrow or plow. If he doesn't handle them, write us at once for free catalog.



THE CUTAWAY HARROW COMPANY
Maker of the original CLARK disk harrows and plows
839 MAIN ST., HIGGANUM, CONN.

Waterman's Ideal Fountain Pen

For any writing you have to do, either out or in-doors, Waterman's Ideal will make it easier. The smallest size will write about 20,000 words with one ink filling, and will always start to write the instant the pen touches the paper. The entire pen is strong and safe to carry. One Waterman's Ideal will last for many years. Saves not only time but money and makes better writing. There is also a Safety Type for Women.

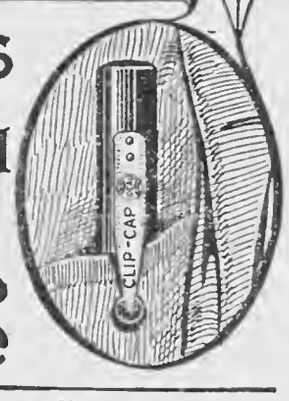
"Made in U. S. A."

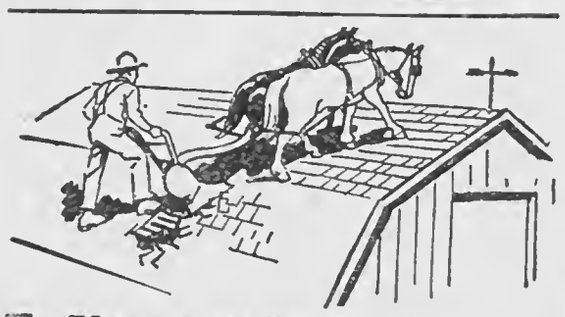
Every pen stamped Waterman's Ideal is guaranteed to give satisfaction. Gold points furnished to suit every hand. Prices $2.50 to $50.00. Illustrated booklet on request

Sold at the best stores in most all cities and towns.

L. E. Waterman Company
173 Broadway, New York

Always With You Ready to Use





You wouldn't plow your building

Of course not. And yet, many a poorly painted barn grows a big crop of repair bills, like a well plowed field. Prevent such crops by a judicious use of

Dutch Boy White Lead

and Dutch Boy linseed oil. Hold your building up to par value, whether it is house or barn or fence. Good paint is many times cheaper than rust or rot.

Red lead—best for implements and metals—comes in a paste form that doesn't dry out in the can.

A Text Book of House Painting FREE

Ask for Farmers' Paint Helps No. 2515

Tells about mixing paint of any tint for any farm use; how to estimate amount and cost; how to test for purity.

National Lead Company

New York Boston Cincinnati Cleveland Buffalo Chicago San Francisco St. Louis (John T. Lewis & Bros. Co., Philadelphia) (National Lead & Oil Co., Pittsburgh)

Harvey RACINE Bolster Springs

prevent damage to eggs, garden truck, fruits or live stock on road to market. Make any wagon a spring wagon. Soon save cost—produce brings bigger prices—wagon lasts longer—horses benefited. Thousands in use. "My wagon rides like auto" says one user.

MADE LIKE FINEST AUTO SPRINGS

Same principle—same care—same high-quality steel in Harvey Bolster Springs as in finest automobile springs. In resiliency, durability and appearance they cannot possibly be excelled. The Standard Springs of America since 1889. Get a pair at your dealers. If not at dealer's write us. Insist on Harvey's. 40 sizes-fit any wagon-sustain any load to 10,000 lbs. Catalog and fistful of proof free.

Ruralisms

Onion Questions.

I HAVE a plot of onions, Silverskin, sown last of April, looking well; some are very large, some are small. Do you think those that do not get large and are unripe would be all right to leave out all Winter? In Spring would they get ripe or go to seed? Would it be a good plan to sow onion seed in August for next year? L. G.

Climate has much to do with the success of Fall-planted onions, and your letter does not say where you live. If the Silverskin onions are quite small you can plant them and make early green bunching onions, but if left to ripen they would probably fail to do so and would run to seed. Here in the southeast corner of Maryland we plant onion sets in September for early green onions, and also plant sets of the Yellow Potato onion for making mature onions, since this species makes no seed and forms sets as offsets to the main bulb. The white Silverskin onions I think will run to seed in late Spring. W. F. MASSEY.

Distributing Grape Root-worm.

GRAPE roots grown in a territory infested by the root-worm, taken up in the Fall and stored in a cellar, are to be transported in the Spring to a locality not known to have the root-worm. Would the roots carry the root-worm to the uninfested locality?
Irving, N. Y. H. G. H.

While there is the possibility that the larvæ of the Grape root-worm might be carried in the manner above described, the probability that it is distributed in this way is very remote. In digging the roots all earth is removed and the subsequent grading and handling would dislodge those that were taken to the cellar on the roots. The fact that plantings of cuttings are rarely attacked by the root-worm beetle would also tend to lessen the probability of its spread in this manner. The larvæ drop to the ground in very close proximity to the vine on which the eggs were laid, and migrate but little if any from the point at which they come in contact with the soil. Further, the wood and bark of the growing cutting do not offer a favorable place for egg laying, as they are placed in protected spots, such as beneath the shedding bark of the old stems, arms or second-year wood. The spread of this pest has been almost entirely through the flying of the beetles from vineyard to vineyard, and no doubt aided by the prevailing winds.

F. E. GLADWIN.

Chinese Peonies.

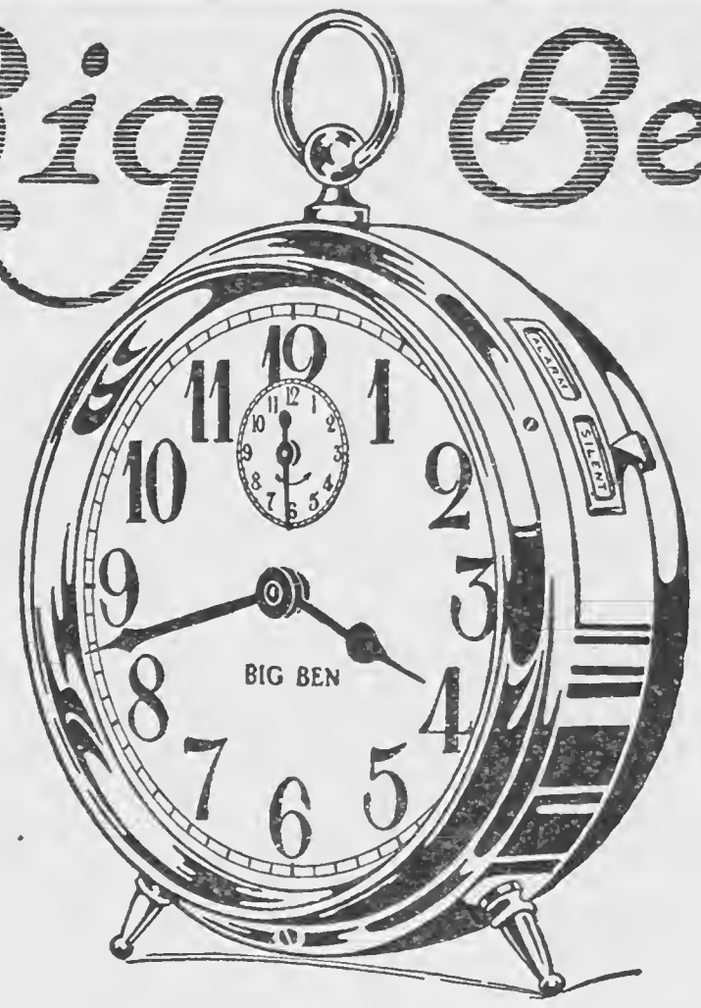
BULLETIN No. 97 of the Office of Foreign Seed and Plant Introduction, mentions some new tree peonies (Pæonia Moutan) sent by Mr. Meyer from Tsao-choufu, Shantung, China:

Twelve rare varieties of tree peonies, among which are said to be yellow, blue, green and black flowered ones. The soil best suited to these tree peonies is a loose porous, sandy loam, with perfect drainage and of great depth. In the district to the northwest of Tsao-chou one finds such soil and climatic conditions as seem to suit this peony to perfection, and the plants are grown there on fields as regular crops, and are sent all over eastern China, going as far south as Canton, and as far north as Mukden, to be used mainly for forcing purposes. There are said to be more than 300 varieties in cultivation here. The best time for transplanting is considered to be September, while propagation is effected through division. The plants require 3½ feet distance in all directions to develop to perfection, while older plants need even four to six feet distance apart. At the approach of Winter these peonies are covered over with some soil, which is taken away again in early March. This saves the flower buds from being Winter-killed, and reduces danger of damage by men or beasts, as the wood of the tree peony is quite brittle. It is thought that possibly an industry could be established in some suitably section of the semi-arid southwestern United States, where the tree peony could be grown in large quantities, to supply florists with one of the most decorative flowers for Winter forcing purposes.

WANT TO KNOW.

DISK HARROWS; MASSACHUSETTS PEACHES.—Will you ask your readers which they prefer in disk harrows, large or small disks, plain or Cutaway, pole or fore truck? Also, in Massachusetts, what good market peaches ripen in August? F. B.

Big Ben



Every farmer should hire him

You pay him only $2.50 for 365 full 24-hour days a year—and nobody knows how many years he'll last, for he has never been known to wear out

His board amounts to a drop of oil every twelve months—that's all the pay he asks.

His work is getting the farm hands in the fields on time, starting the before-breakfast chores on time, and telling the right time all day so the women folks can have the meals on time—these are easy jobs for him.

Big Ben stands seven inches tall. He is triple-nickel plated and wears an inner vest of steel that insures him for life. His big, bold figures and hands are easy to read in the dim morning light. His keys almost wind themselves. He rings for five minutes straight, or every other half minute for ten minutes, as you prefer.

The next time you're in town, just drop in at your jeweler's and ask to see Big Ben. If your jeweler hasn't him, send a money order for $2.50 to Westclox, La Salle, Illinois, and he'll come to you, transportation charges prepaid, all ready for work. Hire Big Ben for your farm and he'll prove the promptest hired man on the place.

TILE DRAINED LAND IS MORE PRODUCTIVE Carries off surplus water. Increases the value of your land. Acres of swampy land reclaimed and made fertile by using JACKSON'S DRAIN TILE. We are producers of Albany Blue Slip Clay, Hollow Brick and Blocks. Dealers in Sewer Pipe, Flue Lining, Fire Brick and Chimney Tops. Send for catalog and prices. John H. Jackson Tile Co., Inc., 89 Third Ave., Albany, N. Y.

ROUND TILE

Alfalfa Thrives on Subsoiled Land

Alfalfa roots go down six feet or more. Alfalfa cannot do its best on land with a stiff subsoil. *Any* crop will yield heavily when the subsoil is broken up, releasing rich buried plant food. You can harvest bumper crops of alfalfa, hay, grains, vegetables and better fruit by blasting the subsoil with

Atlas Farm Powder

THE SAFEST EXPLOSIVE

The Original Farm Powder

Made especially for farm use. Easy to buy and easy to use—punch a hole, load it, light a fuse, and the work is *done!* Quick, safe, and economical. Subsoil now, and the extra profit in your next crop will repay its cost many times.

Atlas Farm Powder will save you time, money and toil in getting out stumps and boulders, digging ditches and holes for trees, and doing many other jobs. You need no experience and no expensive equipment when you use it.

"Better Farming" Book FREE for Coupon

Thousands of farmers have received our valuable illustrated book, "Better Farming," which shows how to make more money by using Atlas Farm Powder, the Safest Explosive. If you have not had yours, send the coupon and get it now.

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York
HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates, 75 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. We use every possible precaution and admit the advertising of reliable houses only. But to make doubly sure, we will make good any loss to paid subscribers sustained by trusting any deliberate swindler, irresponsible advertisers or misleading advertisements in our columns, and any such swindler will be publicly exposed. We are also often called upon to adjust differences or mistakes between our subscribers and honest, responsible houses, whether advertisers or not. We willingly use our good offices to this end, but such cases should not be confused with dishonest transactions. We protect subscribers against rogues, but we will not be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and to identify it, you should mention THE RURAL NEW-YORKER when writing the advertiser.

THE foreign war has produced a demand for oleomargarine and butter. Europe demands mostly an "oleo" containing cocoanut oil, and Germany has been the great center of production of this oil. In this country "oleo" is chiefly made from oleo or beef oil, neutral lard and cotton oil. England alone imports 80,000 tons of pure butter from Denmark, and 100,000 tons of oleo from Europe. This country has been exporting the oleo oil to Europe, where it has been mixed with cocoanut oil and other fats. In Europe this mixture is sold for what it is, as the laws are very strict against imitating pure butter. In France and Germany many fine dairy herds will be destroyed and Denmark will lose part of her dairy export trade. All these things ought to help American dairymen if they can combine to make and ship a standard product.

*

POTATO digging is now on. In dry compact soils or in wet weather handling one of the large, powerful diggers is a serious thing for the horses. The digger itself must be made with great weight in order to stand the strain, and the machinery working in dust and dirt requires great power to lift and sift out the tubers. It now appears that farmers are experimenting with small gasoline engines mounted on the frame of the digger. These little "strong-arms" operate the machinery, so that about all the horses are expected to do is to move the digger onward. This plan of mounting the little engine on a binder or reaper to operate the working parts has proved successful in the West—saving the work of one or more horses. The digger proposition is harder and more complicated, but we understand it is working in many cases.

*

THE people of the Gulf States are getting their full share of advice just now about breaking away from all cotton growing. The latest comes from Dean W. M. Jardine of the Kansas Agricultural College:

The war will be of greater benefit to the South than to any other part of the United States, because it will force the Southern planter to abandon his single cropping system and adopt diversified farming methods. This will, in the long run, help the Southern farmer.

Since long before the Revolution efforts have been made to induce the Southern planters to produce more bread, butter and meat and the same amount of cotton on fewer acres. The boll weevil and the war together will do much to change Southern farming. There are other "one crop" sections which should be stirred up. There are the dairy districts which provide New York cities with milk. Side crops are badly needed there, and they are slow to work in.

*

SOME time ago a farmer wrote making serious charges against a business firm. He expected that we would, on his statement alone, and without any investigation, denounce this firm publicly. We do not do business that way, but after a long and expensive investigation it became clearly evident that the farmer was right, and the firm in question finally paid him a good sum of money in settlement. A little later the farmer came with another trouble. This time he was clearly in the wrong. He had made a definite agreement, knowing what he was doing, and was under legal and moral obligations to carry out his contract. Yet he came and asked us to help him as we had done before, and to use our power to "get him out of a scrape." The point is that this farmer expected us to take his side and bring power to bear upon the other man, whether the cause was right or wrong! Such cases do not often occur, but now and then we are expected to do battle for a man just because he is a farmer, and without regard to the true merits of the case. We spend time and money freely in trying to help our readers—in cases of misunderstanding or injustice giving all sides a fair hearing. Whatever power we may have to compel the righting of a wrong comes entirely from the backing of our readers. They would never knowingly stand for a man, who was in the wrong, simply because he was a farmer.

LIME FOR LIBERATING POTASH.

PROF. WM. P. BROOKS, of the Massachusetts Agricultural College, questions the statements or teachings that an application of lime to the soil will serve to liberate potash from unavailable combinations and make it soluble for plant feeding. He says that this theory has usually been taught, but his own experiments do not justify it.

It would be presumptuous for me to take the position that lime never has this effect, but facts connected with one of my most important lines of experiment appear so conclusively to indicate that the effect of lime in this direction is insignificant that it seems to me best to call attention to these results.

For the past 25 years Prof. Brooks has conducted fertilizer experiments on a soil naturally rich in potash. Analysis of this soil shows a good supply of available potash and also a large amount not soluble. Most leading farm crops have been grown on this field, but corn more frequently than others. The application of 160 pounds muriate of potash to the acre has increased the yield of corn 27 bushels of grain and 220 pounds of stover. This shows that an application of available potash was needed to obtain a good crop of corn. Now on one plot of this experiment large quantities of lime have been applied. As it has been shown that the corn needed more potash than the natural soil supplied, Prof. Brooks reasons that if lime renders the potash in the soil available there should have been an increase of corn where the lime was used. The facts are that the corn crop was smaller where the lime was used. On one plot where, all told, 9,620 pounds of lime to the acre have been used, the crop was quite inferior to the unlimed plots. Prof. Brooks says that much the same results have followed the use of land plaster, and he offers them as evidence that lime will not substitute indirectly for potash. As we have stated, the scientific men do not quite agree on this question, but the majority of them seem to believe that the chemical action of lime, particularly in heavy clay soils, is to take the place of potash in soil combination—leaving the latter free. This chemical action is clearly described by Dr. A. D. Hall in his book on "Fertilizers and Manures," which is a record of the famous Rothamsted experiments:

The action of lime upon the potash compounds in the soil is equally marked; as the soil water carries down the dissolved calcium bicarbonate it attacks the zeolitic double silicates in the clay and a portion of their soluble bases, potash among them, changes place with the lime and comes into solution. Thus lime is precipitated and potash is found in the soil water. The action is the converse of that which takes place when potash salts are applied as manures; whatever base is in excess in the water reaching the soil will turn the others out and be precipitated in the solid zeolite. When potash salts are applied to the land the strong solution thus formed attacks the zeolites and replaces calcium by potassium, thus the potash is precipitated and lime salts go into the drainage water; when lime is applied to the land the process is reversed and potash goes into solution as bicarbonate.

It is quite possible that Prof. Brooks has overlooked the fact that corn (and some varieties in particular) is not a "lime plant," and does not respond to lime as most other grains do. In our own work we have found that both corn and rye prefer a somewhat acid soil, and are really held back in development by heavy applications of lime. We think there is a difference between dents, flint or sweet corn in this respect, and from our own experience we do not wonder that the corn did not respond freely on this heavily limed soil. Where the authorities disagree it is hard for the practical farmer to decide. Most soils long in cultivation need lime in any event. We should not use it freely on corn, but we expect good results from its use on small grain, grass and clover or cover crops.

*

FROM your experience I would like to have your opinion as to what can be made per year per hen over and above all expenses, buying all feed. There must be some big chicken men in your list who could give you this information. I expect to go into the chicken business, and I would like a good solid base to work on before I take the leap. M. M.

During the past month we have received at least 25 such questions. How much profit will a hen pay? How long is a piece of string? It looks as if there is to be a great migration into the chicken business on the part of men and women who know little or nothing about it. Some of them may have seen a hen, and perhaps have studied books and bulletins, but most of them are untried, and have the practical part of the business to learn. Now what can an honest man tell such people? If he has ever paid the feed bill of a flock of hens he knows that the bird does not count so much as the man. Is this man strong and self-reliant? Has he bulldog determination and fight? Has he capital enough to carry him a year? Is there any streak of laziness in him? Does he know what breed he likes best? Is he capable of that affection and gentleness which enables a man to gain the confidence of a hen or a cow? Unless he has these qualities, or most of them, his hens never will give him any profit, and he will merely discredit the business by going into it. Let us know your character before we make a guess as to what a hen will do with you. There are many "big chicken men" on our list. Let us see if any of the really big ones who have nothing to sell, will criticize these statements.

*

ENGLISH farm and garden papers contain advertisements like the following, from London *Gardener's Chronicle*:

WANTED—Two Active YOUNG MEN for Kitchen Garden and Pleasure Grounds, for period of war; men not eligible for the Army, with slight physical defects; wages 18s. per week, Bothy, etc.—Apply, E. STEELE, Acryse Park Gardens, near Folkestone.

This shows how the European War is affecting English labor. Not since the danger of Napoleon's invasion a century ago have the English people felt the necessity of making every effort to recruit their last available man. Napoleon kept a great army on the coast of France for months—waiting for a chance to slip across the Channel and strike at London. Day and night the English warships watched him, and when Nelson won the naval fight at Trafalgar there was no hope for a French invasion. To-day there is a new peril for England. Her fleet may control the water, but who can tell when a swarm of airships will fly out of German territory and drop their horrible explosives into the heart of London? Surely this is no time for able-bodied men to stay at home working in English gardens!

*

DR. T. N. CARVER makes a good point out of the fact that would-be philanthropists are trying to locate the city cheap and unskilled labor on farms. Gangs of cheap labor in our country districts will injure social conditions:

With an abundance of cheap labor at his disposal the big farmer will crowd the man of moderate capital from the field. If the time ever comes when there is cheap labor in the country, as there is now in the city, two large classes will be developed, the large land-holding class and the working class, with a small third class which will hold much the same social position as did the poor whites who competed with slave labor in the South.

This point was brought out in our little book, "The Child," and it is one of the great questions which this generation must face. The true strength of this nation lies in the class of smaller freeholders who own and occupy their farms. It is universal history that when this class is removed or weakened the nation goes down. The "factory system" applied to farming—under which gangs of homeless laborers produce the nation's food—will crowd out the freeholder. The proposed land banks, with the opportunity they offer for small safe long-time loans, will help farmers over and save land, and that is the most desirable thing that we can think of.

BREVITIES.

KANSAS farmers boast of 7,137 silos against 60 in 1909.

IF your hens eat salt or other food likely to injure them as good a thing as you can do is to give a cathartic at once. One or two teaspoonfuls of castor oil to each bird will help.

MAGNESITE has mostly been imported from Germany. There are large deposits in California. The war creates the necessity and the Panama Canal gives opportunity for California to supply this mineral.

A CONSTABLE or special officer in New Jersey arrested an Italian for stealing fruit. The prisoner broke away and ran. The officer fired and killed the man. Judge Garrison of the Supreme Court has decided that this officer may now be tried for murder.

THE Supreme Court of Pennsylvania has decided that the amount of damage collectible on growing timber set on fire through negligence is not only the value of the wood destroyed, but also the injury to the property as a whole through the destruction of the young growth.

WHILE this country has supplies of most minerals there is a shortage of tin. We must depend on foreign countries for our supply. Each year nearly 40,000 tons of tin concentrates are sent from Bolivia to Europe to be smelted and then brought back here. Now a tin smelter is to be built in this country and the Bolivian ores brought directly here.

HERE is a new one from the North Dakota Experiment Station, advising farmers to leave every fourth row of corn standing to hold the snow on the land. "It was found that one-fourth of the cornstalks left standing stopped about as much snow as when all were left. This will in many cases mean a good deal to the next crop. The added moisture will make the soil less liable to blow, and the standing stalks will check the wind a good deal, near the surface, and this also reduces the drifting. Better try leaving a few rows and see if it does not pay."

Pacific Apples in South America.

AS evidence of the aggressiveness of the Northwestern fruit growers, a resident manager has been placed in Buenos Aires to look after the interests of the Exchange the entire year. Northwestern fruit has sold in Buenos Aires and Rio at notoriously high prices heretofore, owing to monopoly of the New York and London middlemen, buying at low figures in the West, the fruit having often sold in South America as high as $16 a box gold.

This is but further evidence of the thorough preparation those Western growers are making to dispose of their apples. They know the export trade to Europe is limited while the war lasts, and they must hunt for other markets. South America is a good field for cultivating the apple-eating habit. There is no reason why apples should not become as popular in the warmer latitudes as oranges and bananas are in the temperate zones. Let any man think for a moment what will happen if the people of Brazil or Central America come to eat apples as freely as our people consume tropical fruit. Yet such a thing is entirely possible if systematic efforts are made to let these people of the Southern countries know what a good apple tastes like! The Western people are alive, and are doing this work well. If they are left to do it alone they will receive the benefit, for they will take care to preach the theory that the Pacific coast apples are superior. What is the Atlantic coast doing about this? Acting as individuals alone, apple growers will never control new markets.

New York State News.

FARM BUREAU NEWS.—The September Bulletin of the New York State Farm states that 15 boys were taken to the State Fair by the Farm Bureau manager of Erie County and were required to write an essay on their "agricultural observations at the fair" for which prize money to the value of $37 was offered. A new Grange has been organized in Cattaraugus County at Lyndon, largely through the efforts of Farm Bureau manager H. K. Crofoot; C. S. Regan, Farm Bureau councilman, was chosen Master of the Grange. The Farm Bureau of Monroe County made a fruit and grain exhibit at the Rochester Industrial Exposition. A championship stock judging contest was conducted by the Farm Bureau man of Tompkins County at the county fair. It was for boys under 18, and there were 46 boys who had part in the contest. M. E. Chubbuck has resigned as manager of the Herkimer County Bureau and has become manager of the Chemung County Bureau to succeed Mr. Scoville. J. W. Doty of Niagara County succeeds Mr. Chubbuck in Herkimer.

NEW BUILDING FOR AGRICULTURAL SCHOOL.—Plans for the new dairy building at the agricultural school at Delhi have been approved by Commissioner Huson and the board of control. This will be the first of several buildings to be erected from the appropriation made by the Legislature and is subsidiary to the main groups of administration, instruction and laboratory buildings.

THE GRAPE INDUSTRY.—About 300 carloads were forwarded during the week from Lake Erie Valley points of which Westfield is the center. The estimates made early in the season will hardly be realized, in respect to the size of the crop. The grape juice companies are starting in the price at from $30 to $35 per ton. It is believed by experts that bulk grapes will run steady at $30 or a little more. The grape juice manufacturers promised the growers $35 at the opening of the season as a minimum price but later trade conditions did not warrant their taking all the acreage offered, so actual contracts were only 50 to 60 per cent. of the offerings.

APPLES FOR EXPORT.—The demand for export apples is constantly increasing. The demand for space on steamers is in excess of their capacity, which is owing to the good prices which have been prevailing on the English and Scotch markets. Reports from the belt reveal a shortage of fancy Greenings, and this condition is said to prevail in the New England States as well. The weekly movements of apples to foreign ports totaled last week about 50,000 barrels and the total movement up to the close of that week was 123,361 barrels. Of this number of barrels 35,254 went out from the port of New York. According to reliable reports it appears that Liverpool has had thus far 20,000 more barrels than last year, but London has taken less by about one-half, Glasgow has about the same and Hamburg, notwithstanding the war, has had about four times as many barrels as last year. It may not be wholly fair to make comparisons with last year as the crop was much lighter then than now.

HOPS ARE PROFITABLE.—Some hop growers in the vicinity of Waterville will make small fortunes this year from their hops. As the price is likely to start in around 50 cents per pound it means that a man who markets 20,000 pounds, and there are some such, will realize $10,000 from his crop. Added to this fact that nearly all hop growers also conduct dairy farms or grow varied crops on large acreages, it is quite evident that there will be business for the Land Bank or some other bank in that section. Reports from Richmondville are to the effect that up to last week there had been very little doing in the hop market and the general anticipation of a better than 50 cent price is giving way to a feeling of another sort.

BIG ALFALFA CROP.—A few years ago Alfalfa was a comparatively unknown crop, that is as grown to any extent. Now one county in this State—Onondaga—will report a crop of Alfalfa worth $1,000,000. The county has an estimated acreage of Alfalfa of 15,000 acres, which places it at the head of all counties in the State, not only, but it leads all other counties east of the Mississippi. The limestone belt that runs across the county makes an ideal soil for the growing of this crop. As high as $22 and $24 have been received by Onondaga County farmers for Alfalfa this year. This county is also famous for its apples. It is said that one orchard will produce 30,000 bushels this year. There are 640 acres of apple trees, a total of 28,000 in number. J. W. D.

Government Crop Report.

THE last regular report for the season puts the total wheat crop at 892,000,000 bushels, about 4,000,000 less than previous estimates. September was favorable for finishing the corn crop, the estimate being 2,676,000,000 bushels, or 78,000,000 more than was expected in late August. Oats are put at 1,137,000,000, the per acre yield being 29.6 bushels; barley, 197,000,000 bushels, 19,000,000 more than last year; flax, 17,000,000 bushels; tobacco, 954,000,000 pounds; and apples, 230,000,000 bushels, which is 10,000,000 above the previous estimate.

The cotton outlook in early October was for a yield of 7,400,000,000 pounds in our 14 cotton States. The area in cotton is about 36,960,000 acres, 1.3 per cent. less than last year, but the per acre yield is 200.2 pounds of lint, 18.2 more than in 1913. Texas leads in area, 12,052,000 acres; Georgia, 5,398,000; Alabama, 3,912,000; Mississippi, 3,148,000; Oklahoma, 2,854,000; South Carolina, 2,826,000; Arkansas, 2,527,000; North Carolina, 1,589,000; Louisiana, 1,389,000; Tennessee, 866,000; Florida, 194,000; Missouri, 124,000; Virginia, 46,000; California, 35,000.

Rosewood by the Cord.

THE picture shows a pile of rosewood in front of a New York steamer dock. The sticks shown are five to 10 feet long and run six inches to a foot in diameter. This rosewood came from the West In-

ROSEWOOD IN THE ROUGH. FIG. 533.

dies. The ends show crude ax work, as though done with poor tools or by inexperienced men.

Modern Freight Storage.

BUILDINGS for the handling and storage of freight at terminal points were formerly made low and often of wood, dingy and dirty inside and out. The picture shows one of the finest modern buildings for this purpose, 26th St. and Hudson River, N. Y. It is of reinforced cement and steel construction, nine stories high and strictly fireproof. One side is accessi-

CONCRETE RAILROAD WAREHOUSE. FIG. 534.

ble to trucks, and on the other, shown in the picture, cars are loaded and unloaded. Elevator service makes all of the floors quickly available. Cars from the railroads terminating in New Jersey are brought by lighters to the New York side and run from the floats to the yard in which the building stands.

The War and Commerce.

EXPORTS from New York for two recent weeks amounted to $33,300,000. There is again a shortage of steamer space, owing to the number of ships taken for army transport. Present steamer rates to Liverpool are: Grain, 7 to 8 cents per bushel; flour in sacks per 100 pounds, 21 cents; bacon, beef, pork and lard, ton, $7.25; butter $14.50; cotton, compressed, 70 cents per 100 pounds.

Business in grain has been on nearer a normal basis than for a month previous. Export sales are averaging about 500,000 bushels daily, but at prices considerably under previous figures. Reports from the countries at war indicate that great efforts are being made to increase the acreage of Fall sown grain, the work being done by prisoners of war and old men and others at home. On the whole the prospect for next year's foreign grain crops is much better than was anticipated.

American factories in many lines are busy with war supply orders. Among other items are: 1,000,000 blankets, 500,000 sweaters; 1,000,000 yards of tent cloth; 30,000 saddles and an equal quantity of artillery harness, horse shoes, hospital supplies, horses and mules, motor trucks, and coal.

The London wool auctions opened their fifth series of sales for this year October 6, interest being large. Scoured crossbreds, and other wools suitable for use in existing home contracts, were higher, 10 to 30 per cent. above July sales. Merinos sold lower. England has nominally prohibited exports of raw wool, but it is understood that this does not apply to direct shipments from the colonies, and that exports of merino will be permitted except to hostile countries. Our market has been dull, with buyers taking only enough for immediate needs in hope of lower prices, which do not now seem probable, except on some grades not specially desired. In another week the situation will doubtless develop more definitely.

By government decree the cotton area of Egypt for 1915 will be limited to 1,000,000 acres. At present there are 1,750,000 acres in cotton. The 750,000 acres will be put in wheat and other cereals, of which Egypt imports largely.

The British commission for handling the sugar shortage situation reports that 1,800,000,000 pounds were bought by the government. This is sold to the refiners who are obligated to dispose of the finished sugar at a normal profit.

South Jersey Cranberries.

WHAT is being accomplished by a strict application of scientific methods and the use of the most approved machinery and appliances in the cultivation, harvesting and marketing of cranberries to increase New Jersey's already valuable output, was demonstrated to 200 persons recently at Joseph J. White's extensive bog, a few miles beyond Brown's Mills. This was the annual convention of the American Cranberry Growers' Association. To those who had never seen the system and equipment which have brought to Mr. White the title of "Cranberry King" the inspection was a revelation. The scene was the settlement known as White's Bogs, where there are about 25 houses, a general store and the immense buildings used by Mr. White to handle the cranberries. There are about 1,000 acres in the White tract and 600 are under cranberry cultivation. They show a remarkably fine condition and barring unfavorable elements, he will gather about 40,000 bushels.

The meeting was opened by an address of welcome by Frank S. Chambers, son-in-law of Mr. White, with a response by Mayor C. Fowler Cline, of Wenonah. President E. H. Durell, of Woodbury, delivered his annual address, which was very interesting. He spoke on the best up-to-date method of harvesting and gave many valuable pointers to the growers, who represented nearly every bog and certainly all of the important interests of cranberry growing in all parts of the State. In his annual report Secretary A. J. Rider, of Hammonton, referred in a general way to existing conditions, and said that if New Jersey is to resume her place as a leader of cranberry production there must be a cleaner culture than can be found in many places. "Before we learned some things we know now," said Mr. Rider, "a suggestion of this kind would have been turned down as theoretical, but it is pertinent now. We must have more intensive cultivation and spend less time and money in making over the bogs that have been overrun with brush, briers and bracken." The crop report and forecast which formed a part of Mr. Rider's remarks was given out as being less dependable than in former years, this being due to the holding of the convention a week or 10 days earlier than usual. He said that 50 reports from New Jersey and Long Island growers estimate the 1914 crop at 243,140 bushels, an increase of 27½ per cent. over last year. Limited reports from New England and Wisconsin make a forecast of their crops impossible.

Dr. J. G. Lipman, director of the New Jersey Experiment Station, urged that the cranberry men organize their experimental work for a series of years and cooperate with the Federal Agricultural Department, the New Jersey Station or the State College in providing for the permanency of experiments. He knew that some of the older members of the association owe something of their early success to the suggestions and assistance given by those who had directed the work of the experiment station in years gone by. There is now promise of important and effective work through experiments being made and he wants the cranberry growers to assist in getting the funds needed to produce even greater benefits.

The insect question that is so puzzling to all cranberry growers was touched in a brief address by Dr. J. T. Headlee, another representative of the New Jersey station. He gave the growers an important truth when he said that they must familiarize themselves with the beginning of every devastation and know what is going to happen and what to do to stop it. "Every grower," he said, "must keep in touch with all conditions and the progress of growth and act as such conditions demand. It generally happens that 75 per cent. of the injury by insects has been done before the real condition is discovered, and for this reason it becomes the duty of the cranberry producers to keep awake if they desire to obtain a greater degree of success. You must know when the destructive work is beginning and then act to stop it."

H. B. Scammell, of the U. S. Bureau of Entomology, gave the results of his investigation of the blackhead fire-worm, the girdle-worm and the new root-worm. He said that spraying with pure kerosene at the rate of 180 gallons to the acre, with both sides of the foliage sprayed, will kill about 65 per cent. of these worms, and arsenate of lead at the rate of 16 pounds to 200 gallons of spray is safe poison to use, but, while both do good work, neither produces an absolute control of the infestation. There is nothing so effective as reflooding after the larvæ are old. If young they will live under water for at least four days, and under such a condition it is necessary to hold the water for five or six days.

Frank S. Chambers, chairman, made a committee report on attacks made on the child labor question as applied to cranberry picking by a well-known magazine in November last. He said that all of the charges made had been investigated, and it could be shown conclusively that there is no foundation for the attack. He further said that the growers will welcome investigators with an honesty of purpose who are looking for true general conditions and not exceptional cases, and who are not the paid agents determined to get stories that are misleading and damaging and cause publishers to misrepresent. The experience has been that the families of pickers look forward with pleasure to getting on the bogs.

After luncheon in the large packing house by a Philadelphia caterer there was a tour of inspection of the bogs and the experimental fertilized plots handled under the direction of Prof. John H. Voorhees of the New Jersey station. Much interest was shown in this part of the proceedings. It has been clearly demonstrated by Prof. Voorhees that scientific fertilization will produce a greater yield of berries. He has several one-twentieth acre plots laid out for his experiments, and comparisons were made between the yield of fertilized and untreated plots side by side. The experiment with acid phosphate, which he suggested be used at the rate of about 250 pounds to the acre, seemed to attract the greatest attention among the growers generally.

D. T. H.

Woman and the Home

From Day to Day

EMPIRE BUILDERS.

For all are empire builders here
Whose hearts are true to heaven and home,
And, year by slow revolving year,
Fulfill the duties as they come.
So simple seems the task, and yet
Many for this are crucified.
Aye, and their brother men forget
The simple wounds in palm and side.

But he that to his home is true,
Where'er the tides of power may flow,
Has built a kingdom great and new
Which time nor fate shall overthrow.
These are the empire builders; these
Annex where none shall say them nay
Beyond the world's uncharted seas,
Realms that can never pass away.

—Alfred Noyes.

*

FOR several weeks the Russo-Austrian battle tide has surged about Przemysl—certainly, to American tongues, the most impossible and unpronounceable name the Great War has yet given us. However, it is a good deal simpler than it looks, and while we may not give it the musical accent of those to the manor born, the authorities tell us to call it "Pshem-e-sel," with the accent on the first syllable.

*

A SIMPLE but good grape catsup is made as follows: Boil until well cooked five pounds of Concord or wild grapes, stemmed and washed, in just enough water to cover. Strain through a sieve, add a pint of pure vinegar, a teaspoonful each of ground cinnamon, cloves, allspice, pepper, and half a teaspoonful of salt. Boil till a little thickened, then bottle, cork and seal. One has grapes so much longer than many of the other fruits that it is quite possible to make this after other pickling and preserving is done. We have heard several complaints this year of grape jelly that did not "jell," though carefully made by experienced housekeepers. In some cases it may have been induced by fruit that was over-ripe, but this was not always the case, and we must therefore lay it to weather conditions. Miss Parloa warns us that extra sugar is needed when the fruit has been exposed to much wet weather, and though September gave us 24 days of absolute drought, the excess of rain in August may have affected the maturing fruit.

*

THE New York *Sun* recently published an enthusiastic editorial in favor of New England pie. It credits the Massachusetts Agricultural College with a lament over the decline of pie as a family edible, which is causing pie-making to become a lost art. It is admitted that the pies concocted by alien cooks, and those turned out by factories have lowered pie standards, and caused dietists to object to pies as a whole. The *Sun* observes:

The men of New England will be disloyal to the old stock if they do not rally round the few good women left to whom pie-making at the Puritan festival season is a part of religion. What an aching void there would be after the well-browned turkey was consumed to the last crisp if the pie made from selected pumpkins, blended with the freshest eggs, the richest milk and cunning spices did not follow with its inseparable companion, that masterpiece of pastry, the mince pie! To the last flake of crust those pies can be eaten with a divine relish. The New England conscience is in them, and inevitably they are perfect. Angels will weep if the art is forfeited by neglect and indifference.

After such an eloquent tribute as that, the farm housewife, with the best of pie materials at hand, together with the practiced skill to use them, may realize what a work of art is enclosed within her crisp and flaky pastry.

*

THE official statement that New York City has a lower death rate than the rural sections of the State is an endorsement of preventive hygiene; it is also a warning against carelessness in sanitation. The country has the raw materials for health—fresh air and abundance of wholesome food. One great danger, often entirely overlooked, is contaminated water. No one has so good a chance to control the purity of his water supply as a farmer, and this is a subject for study by every farm community. The Winter usually gives more time for study and social intercourse than any other season on the farm, and it will be worth while to include rural sanitation among the subjects for investigation. There are plenty of good bulletins procurable from State and national sources. The local health officer will do his most efficient work when he is a friend to be consulted in emergencies, and is not regarded as a busybody just "snoopin' around." A good many of the professional investigators and uplifters make elaborate "surveys" of conditions in special localities or industries. Why shouldn't each farm family plan a "survey" of its own disadvantages, and then proceed to rectify them, whether it be sister's headaches from too much cake, or the mud tracked in because the dooryard path has never been properly drained?

The Rural Patterns.

In ordering patterns always give number and size desired. Price of each pattern 10 cents.

8112, Russian Blouse coat. Cut in sizes 34 to 40 bust measure. Size 36 requires 2⅜ yards of 44 inch material

with 1¼ yards 27 inches wide for collar, cuffs and girdle. 8293, Kimono coat. Cut in sizes 34 to 42 bust measure. Size 38 requires 2⅞ yards of 36 inch material with one-half yard 27 inches wide for collar and cuffs. 8290, Loose coat. Cut in sizes 34 to 42 bust measure. Size 38

requires 4¼ yards of 36 inch material. 7296, Norfolk coat for misses and small women. Cut in sizes 14, 16 and 18 years. Size 16 requires 3¼ yards of 36 inch material. 8272, Loose coat for misses and small women. Cut in sizes 16 and 18 years. Size 16 requires 3⅝ yards of 36 inch material with one-half yard 27 inches for collar and cuffs.

8328, Boy's overcoat. Cut in sizes 2, 4, 6 and 8 years. Size 6 requires 2 yards of 36 inch material. 8068, Girl's coat. Cut in sizes 8 to 14 years. Size 12 requires 3¼ yards of 36 inch material. 7217, Boy's overcoat. Cut in sizes 8 to 14 years. Size 10 requires 2 yards of 44 inch material. 7420, Child's coat. Cut in sizes 2, 4 and 6 years. Size 4 requires 2¼ yards of 36 inch material with one-half yard 27 inches wide for collar and cuffs. 7103, Child's coat. Cut in sizes 6 months, 1, 2 and 4 years. Size 2 requires 2 yards of 36 inch material.

Preserving Citron.

WOULD you tell me how to preserve and can citron? H. R.

The following recipes were given in the Rural Cook Book:

Pare and core the citron, cut into strips and notch the edges, or cut into fancy shapes. Allow a pound of sugar to a pound of fruit, and to six pounds of the fruit allow four lemons and a quarter of a pound of ginger root. Tie the ginger root in a cloth and boil it in a quart and and a half of water until the flavor is extracted; then remove it and add to the water the sugar and juice of the lemons. Stir until the sugar is dissolved and the syrup is clear, remove any scum that may form, then add the citron and cook until it is clear, but not enough to fall apart; can and seal while hot.

Citron Preserves No. 2.—Cut the citron in strips half an inch wide, pare off the rind as thin as possible and cut up the fruit in small squares. Put in a vessel and cover the fruit with water in which has been dissolved an ounce of alum to the gallon of water. Soak 24 hours, or until the citron is clarified. Take out of alum water and soak in clear water until the alum is all out, which will probably be in 12 hours. Weigh and allow to each pound of fruit a pound of sugar. Put the fruit in a preserving kettle with only a little sugar, adding sugar several times until the weighed amount has been used. Season with any flavoring preferred. Cook rapidly until done, put in glass cans and seal.

Citron Preserves No. 3.—Pare a large citron, cut into thin slices, and then into strips or squares, removing all seeds. Weigh equal quantities of fruit and sugar, mix together, and stand over night in a large bowl; the sugar draws out juice, forming a syrup. In the morning put in a preserving kettle, and boil slowly for two to three hours, skimming carefully, until the syrup is like honey. About 15 minutes before taking from the stove add, for each quart of preserves, one lemon cut in very thin slices, and one small piece of green ginger root. Some housekeepers add a few whole cloves, but we do not care for this. Another method puts the sliced fruit to soak in brine for a few hours, then in clear water to freshen it, this process hardening the fruit, but we have never used this process.

GREAT thoughts reduced to practice become great acts.—William Hazlitt.

School Conditions on the Great Plains.

"THERE is not another place in the district where the teacher could have a room and bed by herself," remarked a lady who wished us to board the teacher. "In fact I do not know of a district that has," she continued. Teachers in Colorado receive good wages; by law of the State they cannot receive less than $50 a month; in the country that is good, but when one takes into consideration where they have to board and often long distances to walk or ride, it is none too much. I heard a mother tell what her young daughter went through last Winter, and it made me heartsick for the poor girl. She graduated last year from the county high school, standing first in her class, brought up in town and tenderly cared for. The county superintendent asked her to take a school some distance out in the country, as the school where she was teaching had been closed on account of diphtheria. He told her there was a new schoolhouse, and she could board at the postoffice (which was kept in private house). She started with the Star Route mail carrier. It snowed some, but kept getting worse, and finally they got lost, wandered around all night and just before day came to a dugout. The poor girl fell fainting in the door. The people took her in and cared for her as best they could in their one room. Before night she recovered, so they took her on a sled four miles farther to a house where she spent the night, and these people broke roads next morning and carried her to the boarding place. The woman refused to board her at first, but conferred with her sick husband, and as the poor girl was all worn out and crying, finally said she could stay. There were but two rooms, a board partition only: two beds in one small room, one occupied by the sick man, with a curtain between the beds, one small window in the room. She had to sleep with two of the daughters, 15 and 17 years of age, three in a bed

When she reached her *new* schoolhouse she found it made of sod, and the sod had settled away from the door and window frames so much that birds roosted on the seats, which were covered with their droppings. No stove, no table or chair, or desk for the teacher, no maps, no books. The people where she boarded took an old stove and some coal when they took her to the school house. She was a brave, gritty girl, only going home twice in the six months' term. She never let her parents know what she had to go through until school closed and she was home. "If I had known it, my daughter would have come home at once," said her mother.

We attended a wedding at our little country church a short time ago. The ladies had decorated the church very prettily with several dishes of flowers and plants. First after service at "high noon" the wedding party came in. I was greatly surprised to see such a fine-looking bride, dressed in white satin, lace veil and orange blossoms. They were a nice-looking couple; came to the church in an automobile. The bride lived some six miles out. There was a great contrast between the little church with its bare floor and the dress of the bride. The little teacher whose story I have just related was there, a sweet pretty girl, and I told her I hoped she would never have to pass through another such experience.

"Oh, Mrs. Johnson, I don't believe I could do it again," she replied.

Many a teacher and pupil have only chunks of bread and a cup or bottle of molasses to eat with it for dinner; all drink from the same cup. Nearly all schools have a well in the yard, as it usually is too far from a house to carry water. Our neighbor who lived in a dugout, has built a very comfortable four-room house and they really moved up from the old into the new. The poor woman remarked that she had so much room now she did not know what to do with it—and there are 10 in family, eight children. The good wheat crop this year, with good prices, will help many to build houses and barns. The soddy and dugout will soon be things of the past, but they served their purpose.

MRS. FREDERICK C. JOHNSON.

Seen in New York Shops.

IT is not only the wearers of basques and polonaises who have returned to the styles of the early nineties; small girls are now seen in little Mother Hubbards, instead of the long-waisted French frock, and there is also a decree that the hair must be brushed so that the forehead shows, which has caused a demand for the old-fashioned round comb. Flat black slippers tied on with narrow black ribbons are also noted among childish fashions.

Moravian table linens are noticeable for their satin texture, which is said to be a secret in weaving. The patterns are very beautiful, among those noted being cherries, lilies, orange blossoms, little formal wreaths, and even a combination of stars and stripes. They are not cheap of course; tablecloths range from $4.75 to $28; napkins to match from $5 to $43 a dozen.

Do you remember the "godet pleats" of nearly 20 years ago, when the backs of bell skirts were stiffened with haircloth so as to form folds like organ pipes? These godet folds, but without stiffening, are shown in some tunics attached to Russian blouses. These are over narrow skirts; where the skirt is made without a tunic it falls in ripples at the bottom. Among the new suits are many made of sharkskin cheviot, which is very serviceable; rep serge is another hard-wearing fabric. Both cheviot and serge suits often show trimmings of caracul cloth.

Little girls' school dresses are seen in very practical models to wear over a separate blouse or long-sleeved gnimpe; the waist is cut low and pointed, and there are large armholes. Some are made all in one piece, after the old Gabrielle style, others are long-waisted with a skirt having a box pleat in back and front. The neck and armholes are piped with silk, and sometimes there is a little braid trimming. There is nothing new about such dresses except the large armholes, but they are very practical, especially when making a new dress out of an old one. Blue serge, black and white checks and colored plaids are favorite materials. Among handsomer dresses for children are many of velvet, velveteen and corduroy; even the cotton corduroy known as golfine, which has been very inexpensive, is extremely pretty for this use in soft brown and gray shades. Little boys' "party suits" of velvet, in black, dark blue and hunters' green, show a narrow vest of white pique.

A muff of black monkey was round, not flat, consisting of a central band of the fur about 12 inches wide while at each end was a shirred band of black satin about as wide as the fur. The shirring was gathered in smaller at the ends, so as to make a rather long watermelon-shaped muff. With it was displayed a little toque of black satin with the crown shirred over to one side, and a band of monkey fur around it. A good many new muffs displayed are of this watermelon shape, shirred in at the ends, and many of them show a combination of fur with fabric, or of two kinds of fur. There are also more muffs or sets of the short furs, such as otter, beaver and seal-dyed muskrat. American women have had a prejudice against crediting their furs to the humble muskrat, and it has been known as French seal and several other names, just as skunk was called Alaska sable, but the beauty of these furs has at last given them a place under their real names. In Great Britain muskrat fur has long been known by its real American name of musquash.

Sleeping bags of white worsted, knitted and very warm, are offered for those who sleep out of doors. They are made in Switzerland, and cost $5. A sleeping bag of this sort is very desirable for the modern baby who takes his daily nap on the porch at all seasons.

The art department in some stores is offering large unframed carbon photographs of the beautiful Rheims Cathedral as it was before bombardment, for $3; smaller ones $1. Small engravings of this masterpiece of Gothic architecture are sold very cheaply by firms making a specialty of such reproductions.

Very smart new blouses are shown with a cape effect at the back. Such draperies, however, are not practical for wear under a coat, and that is what one buys a blouse for.

What this Free Book Offers You!

125,000 opportunities to save money, a way of buying that practically doubles the purchasing power of your money, a simple, sure method of reducing your living expenses. You and every other alert reader of this great farm paper can have a copy of this book, free.

It offers you 125,000 opportunities to save money on the things you and your family wear and use in the home, on the farm and in town.

It offers more than 3,000 bargains in *New York Styles* of wearing apparel for women and misses, including dresses, waists, shirts, coats, suits, furs—also gloves, corsets, hosiery, underwear, shoes, neckwear, petticoats, kimonos, knit goods.

It offers 1,300 money saving millinery bargains.

It offers 3,000 unequalled values in men's and boys' clothing, and furnishings.

It offers 1,358 articles of jewelry, silverware, watches, clocks, optical goods—at savings of *at least* a third.

It offers 2,275 chances to practically double the purchasing power of your money when buying laces, embroideries, silks, dress goods, notions, wash goods, bedding, toweling, table linens, fancy goods.

It offers nearly 2,000 dolls, toys and games at prices that enable you to buy much *more*, for much *less* than you expected to pay.

It offers carpets, rugs, linoleums, furniture—700 items, hundreds illustrated in natural colors—*all* priced to make *every* day a red letter bargain sale.

It offers 2,408 items of musical goods, 3,320 cameras and supplies, 2,411 guns, rifles, fishing needs, and other sportsmen's supplies and nearly 1,000 automobile supplies; bicycles.

100 LBS

HOME MADE ACETYLENE brings greatest of city conveniences to the country

The Chicago Gas Company has over 500,000 customers. Other big city gas companies have proportionately as many. These millions of city people wouldn't know how to get along without gas. They long ago found it so superior to oil and coal that they hardly know what these things look like.

City folks used to have this great convenience to themselves. But today HOME-MADE ACETYLENE is even a greater boon to country homes than city gas is to city homes.

Acetylene is ten times richer than city gas—the light is white, more brilliant, and far more beautiful. Acetylene is also like city gas, a perfect cooking fuel. With an acetylene range in her kitchen the country housewife can enjoy cooking in cool comfort without any of the drudgery of handling kindling, coal or ashes.

The light fixtures are, too, handsome brass or bronze—selected from a catalogue of many styles.

The men folks on the place can have big white lights of their own in barns and outbuildings—and have all fixed to light with the pull of a chain without matches.

A quarter of a million farmers now make this light and fuel right at home. Each one fills his acetylene generator once a month with the acetylene producing stone, UNION CARBIDE. The generator does all the rest.

The new models are inexpensive and are wonderful improvements over the early types.

We will be glad to answer questions and mail our very interesting advertising literature. Write to

Live Stock and Dairy

FARM STOCK BREEDING.

General Principles.

PART I.

A MATTER OF BUSINESS.—While it is necessarily true that no farmer can take up the work of stock breeding in an intensive manner and carry it on in its most minute details, yet it seems to be a fact that the prosperity of the farmer is quite largely due to the principles of stock breeding which he practices. This will be true more in the future than it has in the past. There, of course, has been a time when the farmer could make a commercial success by growing wheat and selling the product from his farm but consequent depletion of the soil fertility with the increasing population have made live stock farming more and more a necessity. The time of the exclusive grain farmer has about passed. Corn for silage has, and will in the future more than in the past, taken the place of wheat. The stock is next in line. We must produce more food on fewer acres and since the area of tillable land cannot be greatly increased, a change in the style of farming must take place. There are some principles of stock breeding that should be observed when dealing with all classes of live stock on the average farm. These will be dealt with generally and then we shall apply them to the various general classes of farm stock, horses, cattle, sheep and hogs.

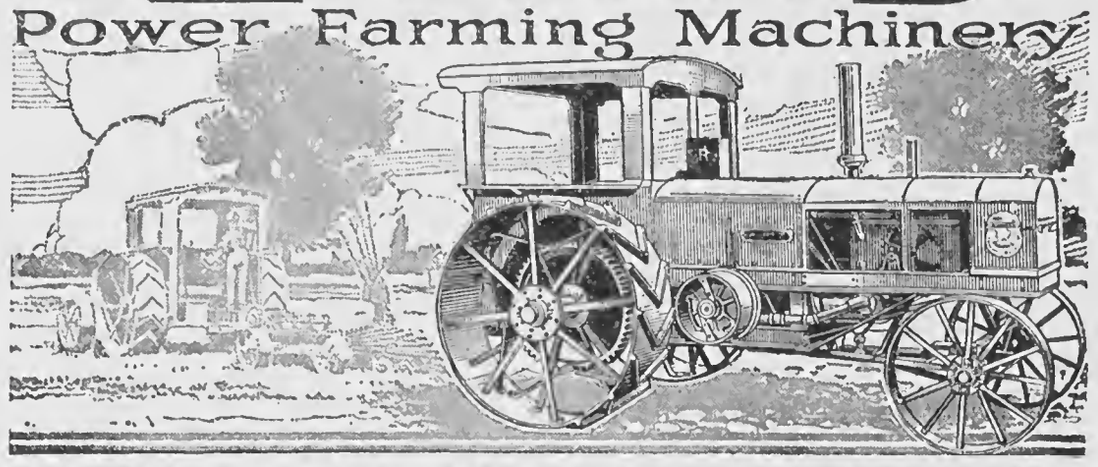
INFLUENCE OF THE SIRE.—We often hear it said, especially in relation to the human family, that the mother is more relation to the child than is the father. This statement is founded on ignorance. We must not take it for granted that because of the mother's close relations with the unborn child that she stamps more of her character upon the offspring than does the father. It often happens that the offspring does show more of its mother's characteristics than those of the father but the reason is not that it is more related to the mother. The offspring must necessarily spend the formative part of its external life with the mother and in this manner, acquires the mother's habits and characteristics. In the science of embryology, we find that there are the same number of character formers in the male as in the female portion. This is true of all members of the animal and plant kingdom. It would be as reasonable to say that the incubator is related to the chicks which are hatched in it as to say that the mother is more related to the offspring than the father. After the egg is once formed, the incubator makes no difference.

THE SIRE'S INFLUENCE.—That the sire is one-half of the offspring, we can easily see and it can be just as easily shown that he is more than one-half of the herd or other collection of individuals upon which he is used. When used in a single cross, the sire is only one-half of the result but when taken on a large number of individuals, the male is more than one-half of the result. We may take dairy cattle as an example. If a bull with an ability to sire heifers of high productive power is used on a herd of low producers, he is much more than half of the herd, for the standard of the herd is raised by his use to a productive power of more than one half. But we must not expect that each heifer resulting from this cross will be a superior producer. While in the majority of cases, the heifers will be better cows than their dams, the breeder must not be discouraged if they do not always prove so. The trouble usually is in knowing the bull to be a sire of high producers—this takes a test period and by the time this has passed, the old bull has become intractable and hard to handle and by the time his records are available, he has gone the rounds of the butcher's trade.

DETERMINATION OF SEX.—The determination of sex is a question that has held great interest for investigators, from antiquity to our modern days and still no one knows how it really is determined. It would be a great achievement if one could control sex by some external operation for many times the females of a certain species of animal are much more valuable, commercially, and if man could influence the sex nearly all of them would be females or males, whichever might be worth more money. Many farmers believe that breeding females during the latter part of the period of heat will produce males, and vice versa, and a great many experiments have been performed and surgical operations made to discern how sex is determined, such as removal of one ovary or testicle, etc., but the progeny still continues to be approximately one-half male and one-half female. However much value it would be in a commercial way to control sex, still it seems that it is a wise provision of nature that causes sex to be so determined that the number of males born is about equal to the number of females. This gives a chance for a better choice of males than as though man could control this. One reason why a great many of the theories advanced have seemed to have some truth in them is that there are only two chances for sex determination; the offspring is either male or female. If there were a chance for many sexes, we would have a better opportunity to determine if sex may be influenced by any external factors. We do know, however, from a study of embryology that sex is not determined at the time the two parts of the egg unite; that is, it is not to be seen by the use of the microscope. The embryo is usually quite well developed before any sex can be determined. With those animals which are ordinarily carried in embryo for nine months, the investigators have not as yet been able to distinguish the sex until the individual was about two months in embryonic development. This does not necessarily show that sex is not present before that age but from all outward appearances, the female individual is the same at 1½ month development as the future male individual at the same age. With foals the external sex organs cannot be seen until the embryo is about 2½ months along.

EFFECTS OF INBREEDING.—In the natural state, the strongest male animal of the species was the sire of the future individuals of that species. As soon as the sire became weak through age or accident, he was driven out by the stronger, oncoming males and ceased to sire the offspring. This state of nature often resulted in inbreeding and it seems from a survey of the natural state that this very condition often resulted in perpetuating species characteristics, yet undoubtedly, it was this same inbreeding that has distinguished most of our distinct species. In all probability, all breeds or species first started from a single differing individual. Whether or not it has been this inbreeding which has fastened some of the characteristics of the wild species so tenaciously to themselves, we do know that within comparatively recent and modern times we have

RUMELY
Power Farming Machinery



The GasPull Lightens Work

Let the GasPull do your work. It pulls 4 to 6 plows, 5 binders or a wide strip of harrows or discs. It will haul 30,000 pounds on average roads, and drive a medium size separator to full capacity.

RUMELY GASPULL LA PORTE REG. U.S. PAT. OFF.

15-30 Horsepower

The GasPull is light and handy, weighs only 11,200 pounds and turns on a 15 ft. circle. Levers are conveniently arranged. It steers like an automobile, has a handy foot brake, can be cranked from the ground and is easy to operate at all work. It will cut your farming costs just as it has for hundreds of others.

Ask for catalog GB21. Learn more about it.

In kerosene tractors, the OilPull has no equal. There are no better stationary engine values than the Rumely-Olds for gasoline and the Rumely-Falk for kerosene. Every Rumely machine is backed by Rumely service—49 branches and 11,000 dealers. Supplies and parts promptly furnished.

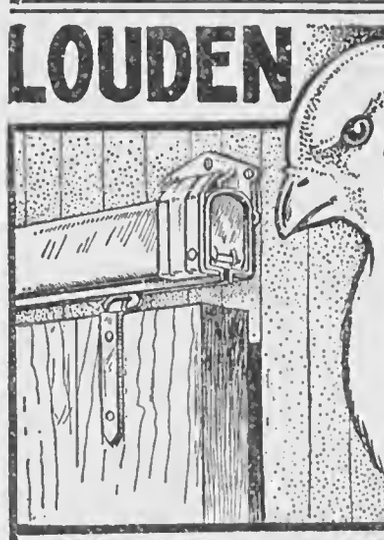
LOUDEN BIRD PROOF BARN DOOR HANGER



This barn door hanger is not only bird-proof but proof against troubles of every kind. The enclosed track, made of one solid piece of high-grade steel pressed into tubular shape, prevents all obstruction, winter and summer. The sparrow is banished; snow, ice, rain or trash can never interfere with its smooth operation.
Center-hung on Roller-Bearing Tandem Trolleys makes Louden hung doors easy to move; flexible construction prevents breakage by crowding stock—always holds door close to the wall. Carries the heaviest doors without sagging.
Illustrated Catalog on Louden Barn Door Hangers, Steel Stalls and Stanchions, Feed and Litter Carriers, Hay Tools, Power Hoists, and other Louden Barn Equipment sent on request. See your local dealer or write us direct.

FOR SALE BY
Rural New-Yorker, 333 W. 30th St., New York

had certain breeds perpetuated and made stronger by what might be called inbreeding. We know that some of the great cattle breeders such as Hugh Watson, who bred up the Aberdeen Angus and Cruickshanks, who standardized the Shorthorns, practised inbreeding very extensively. We can see that a bull of desirable characteristics would materially improve the character of the herd and stamp those fine points upon his get, but another question arises, will the weak points be further stressed? It seems that this is the reason why so many breeders do not favor inbreeding. While it perpetuates the good characteristics of an animal, it likewise fixes the poor characteristics more strongly, and the most perfect appearing animal has some weak points.

BREEDING AND FEEDING.—It takes something besides quality breeding to produce quality animals; it takes also quality feeding. It goes without saying that a successful breeder is a good feeder but the successful feeder is not always a good breeder. It is one thing to put two individuals together so as to get a desirable individual therefrom, but after this young animal is once brought into the world, it takes good care to make it a desirable adult. Poor feeding may result in a purebred scrub and these animals are the bane of the stock breeding work. Some purebred animals do poor work through the care they are given while others do poor work because they were not sent to the block when they were found wanting. The latter were caused by breeding defects. Since feeding is somewhat removed from our subject, it will be dropped here.

EFFICIENCY AND INDIVIDUALITY ARE BREEDERS' AIMS.—The common points which are bred for are efficiency and individuality. By efficiency, is meant the ability of a cow to consume feed and to make therefrom milk and butterfat. The efficiency of the cow in the making of milk or the efficiency of the hen in making and producing large quantities of eggs are innate qualities which cannot be discerned with the naked eye. Such results of breeding cannot be ascertained nor judged by an external examination alone. It requires certain well authenticated records. The other point which breeders strive to attain is individuality, and by this I mean a certain external form. The horse is valued not so much on account of the good use to which he puts his feed in putting on flesh as in the amount of work he can do. The beef animal is valued not so much for his efficiency in masticating and digesting his food as rather for the relative amounts of the expensive cuts of meat on his carcass. The mutton sheep, like the fat steer, is not valued for the efficiency with which he puts on fat but rather for high priced cuts he produces.

Michigan. I. J. MATHEWS.

LIVE STOCK NOTES.

SWEET CLOVER FOR SHEEP.—Sweet clover will soon be a solid mat from Canada to Mexico in the hill and mountain countries of the West, is the opinion of a sheep man in the American Sheep Breeder. It is the only clover that will not injure sheep or other animals pasturing on it, it improves the soil, and makes larger and fatter sheep. It stands abreast with Alfalfa in feeding value. Farmers in Oregon and Washington are sowing it in the mountains for pasture.

GRATUITOUS service of a poor bull is penny wise and pound foolish, while on the other hand it is sensible to pay anywhere from $5 to $50 for the service of a good bull of good breeding. Arizona figures that if a man has 15 cows it would be cheaper for him to pay $5 the head service than keep a bull, but the farm expert fails to consider value of time in taking the cow to the next ranch. They value the bull low, at $100, and in making up the account they charge interest at 5%, taxes at 1.59%, depreciation at 10% and feed at $60. In computing dairy income, interest, maintenance and depreciation of the sire should be charged against the herd.

FOUR years is probably the record length of time to keep silage, and O. W. Righter of Indiana, holds this long distance record. He placed well-matured corn in the concrete silo in 1910, and not long ago emptied the bottom of the silo. Cows ate both the old silage and that last year with equal relish, and the only difference he could observe is that which was kept the great length of time, was slightly more acid. The secret of its excellent preservation is well-matured corn.

FOR SALE—BIG BARGAIN. Two year old SENNAN BUCK GOAT, HORNLESS, TRAINED for Children to drive. F. P. KNOWLES, GUILFORD, CONN.

of Masterpiece and Rivaleer breeding. Well grown. Delivered price quoted.
G. B. & M. S. SCHERMERHORN, Keeseville, New York

BERKSHIRES
We have the large, thrifty kind, with lots of type, quality and breeding. Write for prices and descriptions. TOMPKINS FARM, Lansdale, Pa.

A BRED BERKSHIRE SOW
worth $75, when safely bred for March, April or May farrow, is now a gilt that can be sold for $30. A boar and 3 sows at $100 is therefore a good investment. We have them for prompt movement at that price. Write for further particulars.
R. Y. Buckley, Woodrow Farm, Broad Axe, Pa.

Springbank Herd Big Berkshires
I have a fine lot of March and April (1914) Boar Pigs fit for service this Fall; of high class conformation and good looks.
J. E. WATSON, MARBLEDALE, CONN.

Large Berkshires at Highwood
Just sold eleven sows for export to Argentina. Makes fourth exportation this year. We sold 475 registered Berkshires during 1913, which is over a hundred more than any other swine breeder in the U. S. Most of these went to old customers, which speaks for itself. Selected animals all ages for sale.
H. C. & H. B. HARPENDING, Dundee, N. Y.

Large Yorkshire Swine
We are offering a fine lot of LARGE YORKSHIRE Boars, ready for service. These boars have large bone and are true to type. Also have a few young sows of splendid conformation.

"The Best Pig Breed"

Butter that Will Keep.

WILL you inform me why I am unable to lay down butter for family use so that it will keep a reasonable length of time? I have two very fine Jersey cows, the cream is separated and buttermilk thoroughly worked out of butter. It does not matter how much salt I use, the butter becomes rancid in a short time. On page 934 I note your answer on strong butter. We have complied with all your sanitary requirements, keep a refrigerator for nothing but milk and butter. Tub butter seems to keep well, no doubt there is something put in butter. Will you inform me if there is anything to prevent rancidity? A. B. S.

Massachusetts.

Years ago my father used to make butter from a herd of 40 cows and pack the butter down in 100-pound firkins until he had the cellar about full, and then sell the butter all at once in the Fall. At this time the milk was set in an immense tin pan that had an outer jacket for cold water. The milk was in a thick loppered condition when the cream was taken off, and then the cream was allowed to accumulate for two or three days before it was churned. So you see the cream was what we would now consider very sour before it was churned. Still the butter made from this cream kept sweet for a long time. Why? I am willing to confess that I don't *know*. But I have a notion that this sour cream when churned separated more clearly between the fat and the other contents. The butter that is nearly all fat keeps, while the butter that contains quite a percentage of casein goes strong or "cheesy" in taste.

When people first began using separators it was a very common belief that separator butter would not keep, and I am inclined to think that the reason was that the cream was churned before it became so sour. At Laurel Farm we do not make butter to keep. We don't have to. But if I wished to keep butter for some length of time I would set the separator to run a heavy cream, then I would cool the cream down well, and hold it until I had enough for a churning. Now warm the cream to 70 deg., and hold it at near that temperature until it gets good and sour, stirring it frequently in the meantime, then cool down and churn. Wash the buttermilk out well, and after salting let it stand 12 hours. Then re-work to press out all the moisture possible, pack in new crocks and cover with an inch or so of strong brine. J. GRANT MORSE.

Dry Corn in the Silo.

YOU ask for experience in regards to putting shredded dry fodder into the silo from corn husked by adding water. I have had experience along this line with very satisfactory results. My method is as follows: We aim to cut the corn at just the right time; that is, when the grain is well glazed, before the corn plant is dry; then husk at the usual time. We fill the silo with green corn from field, commence to feed silage at once, then we have no waste. By the time we have the field corn husked the silage, what we have fed and the settling, gives us room to store some fodder direct from field to silo. We have a No. 11 Blizzard cutter; cut the fodder in one-quarter inch length. Here comes the important part. We are situated so that we can run water from a ¾-inch hose right in the fan of the cutter. This will diffuse the water with the fodder so it comes in the silo in a fine mist; in fact, working in the silo one will hardly notice the water at all, so well is the water distributed through the fodder. That fodder with the silage, will last us till some time in February, when we fill the silo again with fodder that is left the same way.

We stack the fodder that is left from the first filling in the usual manner right beside the silo for the February filling. I have done this way the last three years with very good results. If some corn remains in the fodder so much the better silage it will make. The corn in the silo will heat and get soft so cattle will eat it without waste.

First have good quality of corn fodder. You cannot make good silage from half rotten or the other extreme by having it too dry before cut in the field. Cutting it too coarse for the silo is an error, it should be cut fine, so it will pack well. Distribute evenly all over the silo; the leaves and husks will not cut so fine as the stalk—here care must be taken to keep it level. Plenty of water must be used to prevent firefang. There is also risk in using too much water, but this is not likely by the above method. The advantage of putting dry fodder in the silo is that you can improve the feeding value of the fodder greatly, can have some corn to feed to other stock, and by adding these feeds to the silage can balance the ration with cheaper feed than corn. If the directions are followed the fodder will come out of the silo in good condition with the odor of sugar feed.

Pennsylvania. L. B. HUBER.

How to Preserve Silage.

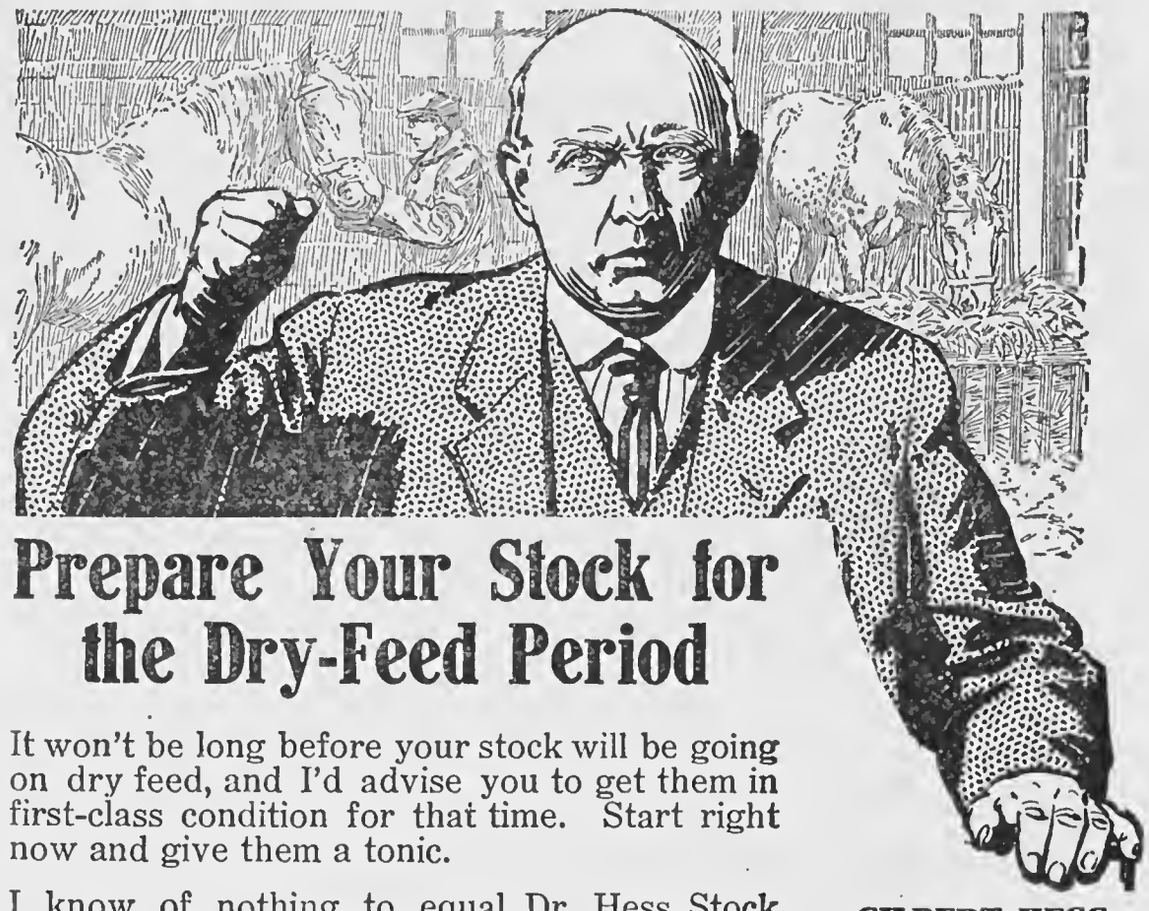
AFTER the silo is filled, or until you have all the corn you care to place in the silo, sow at once a very heavy coating of oats, the oats will sprout and grow, the roots will spread and mat together, thereby keeping the air from the silage. By using the heavy coating of oats very little of the silage has to be thrown away as useless, as compared with what would spoil if it were not for the coating of oats. It means more feed, and very little trouble is required to sow the oats. H. E.

Dairy Conditions in Kentucky.

AT this time of the year business is brisk. Dairymen are making preparations for Winter. For the past two years they have had an up-hill grade; a drought lasting all last Summer up to latter part of September killing all young grasses and short corn crop kept the dairymen in a bad shape to start through Winter. By the closest margin they all pulled through. But to face another long dry hot Summer seemed impossible. This is just what we have experienced; this drought lasting until middle of August. Pastures were completely burned up and nearly all the young clover and grasses sown last Spring. The rains set in this year August 10 and everything has been helped wonderfully, making the best of all pastures we have had in years. All corn has been benefited excepting real early corn; we might say we are in much better shape to go through the coming Winter. There was quite an acreage of Alfalfa sown last Fall; this will help to hold the high price of hay down. A good many sowed forage crops, some sowing for gluten and peas. A good many have built silos, some having filled last week, while others are filling now. In summing up the whole situation prospects look brighter for us; although the war has raised the price of all mill feeds we shall be able to get through the Winter with a little more profit than last.

There are no reports of any dairymen selling out, but some are selling off a few, so as to give the remainder better attention. All are pushing the business for brighter prospects that are coming. High-grade Jerseys, or cows that will produce, are bringing $75, reported scarce at the price, while registered Jersey cattle are selling very high, $100 to $200 according to capacity. There seems to be a good demand for all registered stock; the supply is not equal to the demand, males selling for $50 to $100 and heifers $75 to $125, with the supply limited. S. J. HOWARD.

Kentucky.



Prepare Your Stock for the Dry-Feed Period

It won't be long before your stock will be going on dry feed, and I'd advise you to get them in first-class condition for that time. Start right now and give them a tonic.

I know of nothing to equal Dr. Hess Stock Tonic for putting stock in good shape—strong, healthy and well able to stand the ravages of disease.

DR. HESS STOCK TONIC

A Conditioner and Worm Expeller

This preparation is the result of my lifetime experience as a doctor of veterinary science and doctor of medicine. It contains tonics for toning up the system and enriching the blood, laxatives for regulating the bowels and vermifuges for expelling worms. As a worm expeller, I say emphatically that this preparation has positively no equal, and I'll back this statement up with the strongest guarantee you ever read. Here it is:

So sure am I that Dr. Hess Stock Tonic will keep your stock healthy and expel worms that I have authorized my dealer in your town to supply you with enough tonic for all your stock and, if it does not do all I claim, just return the empty packages and get your money back.

25-lb. pail $1.60; 100-lb. sack $5.00, smaller packages as low as 50c. Except in Canada, far West and South. Never sold by peddlers, but only by reputable dealers whom you know. I save you peddler's wagon, team and traveling expenses, as the above prices prove.

GILBERT HESS
Doctor of Veterinary Science
Doctor of Medicine

Dr. Hess Poultry Pan-a-ce-a

A splendid poultry tonic that shortens the moulting period. It gives the moulting hen vitality to force out the old quills, grow new feathers and get back on the job laying eggs all winter. It tones up the dormant egg organs and makes hens lay. Also helps chicks grow. Economical to use—a penny's worth is enough for 30 fowl per day. 1½ lbs. 25c; 5 lbs. 60c; 25-lb. pail $2.50. Except in Canada and the far West. Guaranteed.

Dr. Hess Instant Louse Killer

Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks and dust bath. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, slugs on rose bushes, etc. Comes in handy sifting-top cans, 1 lb. 25c, 3 lbs. 60c. Except in Canada and the far West. I guarantee it.

Send for my free book that tells all about Dr. Hess Stock Tonic.

DR. HESS & CLARK Ashland, Ohio

Cut down your feed COSTS and make More Profits

Feed less war-priced grain and chop feeds, but get better results from your milk cows, fat stock and horses, by feeding lower-cost

XTRA-VIM FEED

Porto Rican cane molasses for strength and flesh—combined with sphagnum moss for digestive action—in a dry form nice to handle. Takes the place, weight for weight, of feeds it replaces, such as corn, oats, chop, and costs much less. That is clear gain. Animals "go for it"—and it makes other feed taste better when mixed in.

(In 100-lb. Bags)

Is not sticky, handles without waste, licks up clean and won't "muss up" animals or fixtures. Other practical feeders have proved its economy and merit—so can you!

Send for our *Free Literature* on *Live Stock and Poultry Feeding*. We sell direct where dealer cannot supply.

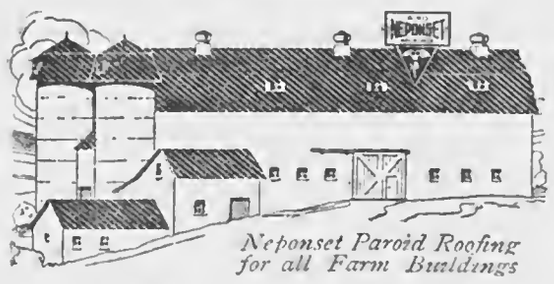
AMERICAN SHEET AND TIN PLATE COMPANY, Pittsburgh.

Are you going to build?

Then Put Your Questions Up to Us

How to make your walls more attractive for less than the cost of laths, plaster and wall paper—how to keep out dampness and cold in winter, thus reducing fuel bills—what roof gives the best value for your money and protects your buildings from fire. Answering such questions is our daily work. Tell us the kind of building and, regardless of whether you use our materials, our building experts can probably save you money.



Neponset Paroid Roofing for all Farm Buildings

Neponset Roofings are the "slowly made" kind. They are long on the roof because they are long in the making.

Long on the roof means maximum protection to your home, to your stock, to your pocket-book. It means protection, year in and year out, in heat and cold, against leaks, repairs and that greatest of dangers—fire.

NEPONSET
ROOFINGS

give this protection at a minimum cost.

There's a slowly made Neponset Roofing for every purpose.

Neponset Shingles are built-up shingles and when laid provide seven weather-proof thicknesses between the roof-boards and the weather.

They are handsome as slate, are spark-proof, non-curling and non-splitting.

Neponset Proslate—red or green—is the roof for bungalows, cottages, etc. Other Neponset Products are: Neponset Wall Board, equal to lath, plaster and wall paper; Neponset Waterproof Building Papers to keep out drafts and dampness; and Neponset Floor Covering in place of linoleum.

The Rural New-Yorker,
333 W. 30th St., N. Y. City.

BOSTON MARKETS.

GENERAL conditions in Boston market are improving slightly, but there is still room for further improvement on several things, onions and cranberries especially, to make these return a paying average above cost. Potatoes are up a little just at present from what they were, but present prices will not make the grower very rich, as 60 or 65 cents per bushel in Boston means probably about 40 cents at some of the distant shipping points for the grower. Sweets, however, are holding up well in prices, longer than is usually the case in this market; $2.50 to $2.75 per barrel being the rule. Tomatoes are selling just fair, a few very fancy sell up to $1.50 per bushel, but the larger part is not fancy and sells at 50 to 75 cents. Root crops are in fair demand at very good prices, beets 75 per box; carrots 65 to 85; parsnips 85 and $1; radish 75; turnips 60 for white egg and about the same for native ruta bagas, with hog stock bringing $1.50 per barrel. Cucumbers $1 to $3.50 per box with demand not heavy. Squash not too plenty, yet prices are easy; marrows bring $1 per barrel, with turbans going at $1.25 in a few cases and Bay State about the same figure. Onions slow at 75 per box, with some sales at about 60 for nearby stock. Corn $1 per bag or a little better in some cases. Cabbage a little better, bringing up to $1 per barrel, yet many are sold for less. Savoys bring about the same as the drumheads; reds $1 per box when wanted. Cauliflower in good demand and sells at $1 per box for best; mediums about 75 per box. Celery 75 per dozen for White Plume, and $1 and better for Pascal, while best Boston Market brings $1.50. Lettuce 60 per box of 18 heads. Beans about done and in good demand; for last lots $1.50, $1.75 and $2 are obtained per box for green and wax. Shell beans $2.50 and better, and Limas, if good, bring as much.

Watermelons about through except small lots, about 50 cents each; cantaloupes about $1 per crate. Plums 30 cents per small basket; pineapples about $4 per crate; bananas $1.50 to $3 per bunch for good yellows, reds $2 to $4 per bunch. Grapes per small basket 11 for Concord, Niagara, Worden and Salem; Delawares 15. Lemons plenty at $2.50 up to $6 per box; oranges $3.24. Peaches falling off in supply and bring about $1 per basket in most cases, with large baskets $1.75 and $2. Pears are wanted, but supply is not heavy for most kinds; Bartletts bringing $3.50 for best Western stock, natives $2.50 and $3 for best stock; Seckel $1.50 and $2.50 according to size and quality. Good Bosc bringing $3 per box, best Anjou $2 with Sheldons about the same price.

Apples are still plenty but demand is better and most stock is sold, which is more than could be said a while ago as many farmers carted part of their loads back home as no offer could be got as the rule for the part left unsold after the morning rush was over. One man had an offer of 10 cents per box to clean up his load and the buyer wanted the boxes thrown in; these cost 8 to 10 cents each. The offer was not accepted and the apples went back to the farm for cow and hog feed. Prices are still low and likely to remain so but if sales can be made at reasonable price many will be happy; $2.75 per barrel for a few fancy Gravenstein and Snow is obtained, while $1.75 or thereabouts buys many other good kinds including Twenty Ounce. Wealthy and Alexanders; McIntosh brings up to $2.50. Baldwin about $1.50. Common box stock around 50 is the rule, but some good stock brings up to $1. A few dealers are offering $1.25 and $1.50 for Winter apples furnished on board cars at country stations, probably this will be about the price for a while at least.

Best butter is firm and not too plentiful and brings 33½ to 35; medium and poor grades are plenty and are worked off for good butter when possible by many dealers, prices on this ranges from 29 to 32. Cheese in rather poor demand and sells at 16 to 18. Eggs in good demand and supply of fresh nearby not heavy, these bring 40 to 45; other grades 27 to 37.

Live poultry a little off; hens 16; chickens, light weight, about the same price; roosters 12. Beef cattle slow and prices range from $8.75 per hundred for best down to 3½ for poor grades on hoof. Fat hogs, live weight, 9½; dressed 11½. Good veal on hoof 8½. Milch cows in better supply than demand, prices range from 50 to 85 as the rule.

Hay market is reported dull as the rule, best horse hay 22; other grades 14 to 20. Rye straw $16. A slight drop in grain has taken place but not enough to help out the small buyer much; bran $24.50 per ton; cottonseed $30; gluten $28.50; meal $1.65 per bag. A. E. P.

Oct. 5. We are quite large potato growers and anything on the growing of that crop is of interest to us. This year we had the largest crop ever grown. Many farmers load a car a day, and some will load two, a car running from 175 to 200 barrels. While the price, except for Cobbler, has not been high, the big crop has been quite profitable. Giants selling during August from $1.35 to $1.50 net 165 pounds. Now they are $1.25. I have just sold 200 barrels of Green Mountain for $2 here. Apples are very low, as there seems to be too many. Bradwelt, N. J. C. A. J.

Meet Us At The
National Dairy Show in Chicago
Oct. 22-31 and See the Practical Milking Demonstration of

The EMPIRE Mechanical Milker

See how easily you can milk 20 to 30 cows an hour and do away with hand milking. It will prove as satisfactory in your dairy as in dairies of other successful businesslike men now using them.

Many recent improvements give it preference over all others. Milks speedily and efficiently. In units to milk one or two cows at a time. Suited to dairies of all sizes. Gently massages the teats. No barn air enters the pail or comes in contact with the milk—the teat cups fit all teats—cups can be taken apart and cleaned easily. Fully guaranteed.

Here is THE Mechanical Milker for every progressive dairyman, large or small. If you do not visit the dairy show, we will, on request, show the EMPIRE Milker to you. Ask us about world renowned EMPIRE Cream Separators, quick starting EMPIRE Gasoline Engines, fast grinding EMPIRE Feed Mills. Address your letter Dept. D.

FEEDING PROBLEMS.

Feeding Apple Pomace to Cows.

AROUND here they joke me quite often about my cows, because I take pains with them and keep so many (14) for one living in a village with only a small farm, but I have quite a little Alfalfa sown now, having just sown some more, which makes me between nine and 10 acres, about one-third of my farm. Last Fall my corn crop only filled one silo, 12x35, which was not as much feed as I wanted. Having a bulletin of the Vermont Experiment Station on pomace, which said it was safe to silo it I went to the cider mill and asked if they would give me the pomace if I took it all, I furnishing wagon and they to dump the cloths on so it would be clean. They laughed at me but said I could have it. People around laughed and wanted to know if I was crazy. I may have been, but from 14 cows after feeding new milk to six calves most of the Winter, I sold an average of $200 worth of milk per month for three or four months. I drew the pomace as often as they had wagon loaded, sometimes two loads a day and again one load in two or three days. I built a conveyor and run same in silo right from wagon and every few days I leveled the silo off according to how fast we put it in. I put it in alone, but when I got above the floor (the silo is in barn with a 4½-foot pit, 10 feet in diameter) the juice ran quite a little, showing the press did not get all the cider out and I think if I do it again I shall cut some straw or other dry fodder in with it continually or in layers to hold that juice.

Speaking of the juice calls to mind my experience a few years ago, before I came to my present location. I had an old orchard of very high trees, and quite a little natural fruit, which made lots of apples which could not be peeled at the canneries or evaporated, and I could only get five cents for a bushel of them, which would only a little more than pay for hauling them off. I had about 20 cows in milk. I drew the apples to the stable, and after we had fed the cows their silage and grain begun to feed a bushel of those whole apples to five or six cows at first, and later fed a bushel to three or four cows. We gained about 25 quarts of milk per day after three days. I fed about 250 bushels in that way with no bad results that Fall, and they were all sour apples. Since then I never sell cull apples very cheap.

I fed the pomace twice a day, one bushel to three cows, with one bushel of corn silage to two cows, Alfalfa hay at noon. For grain I used bran, hominy, cottonseed, middlings, oil meal and some ground oats part of Winter, aiming to feed one pound of grain to three or four pounds milk. C. R. SWEEZEY.

Wayne Co., N. Y.

R. N.-Y.—In feeding apples to cows better begin with a few and slowly increase as the cows grow accustomed to them. It would be a great mistake to begin with a full feed.

Dairy Ration; Small Silo.

WILL you give a balanced ration for dairy cows? The grains to consist of corn, oats, wheat bran, oil meal and cottonseed meal; the roughage is fodder corn and field corn stalks; a few carrots on hand to give as desired. Would it be profitable to erect a silo for four cows, silage to be fed the year around on what is called the "soiling system?" What size should it be?

Schuyler Co., N. Y. H. S. K.

The following ration should give good results with dairy cows: Cornmeal one pound, ground oats one pound, bran two pounds, oil meal two pounds, cottonseed meal two pounds. The amount to be fed each cow of course will vary with the cow, say about one pound of grain per three or four pounds of milk.

I doubt if it would pay to erect a silo, or silos, for four cows. One must take into consideration the cost of silos, of feeding, and of raising the corn, as compared with the cost of feeding by other methods. You can figure up these things better than one not familiar with your conditions. For feeding four cows a silo should not be over seven feet in diameter, so that enough silage may be taken off each day to prevent moulding on top. A silo seven by 30 feet will hold approximately 25 tons, not quite enough for a year's supply, unless you can fill several times. I should judge that 7x36 would just about give you the required capacity. C. L. M.

Amatite ROOFING

Requires no painting

Amatite costs little in the first place and nothing thereafter, as it needs no painting.

You buy it in rolls and lay it with very little trouble, and then it won't bother you for years.

Amatite is the most economical and serviceable ready roofing made.

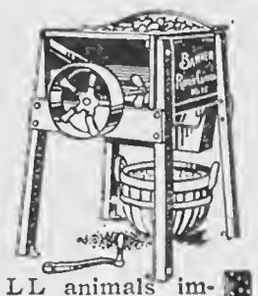
Feeding Roots: More and Better Milk—Beef Mutton



ALL animals improve in condition and increase their product of flesh, milk, wool, etc., by being fed liberal rations of cut roots. No matter what else you feed, cut roots will improve the ration. They add a zest which means increased consumption of roughage and aid in digestion and assimilation. They put a top finish on market sheep and lambs. They put color and richness in milk and cream and resulting butter.

Banner Root Cutters

for both hand and power, prepare roots in the best possible way. Cut so fine as to prevent all choking of animals. It's done with the "Non-Choke Curve Cut." Made in seven sizes. Write for free illustrated booklet. Every animal condition will be improved by feeding a ration of cut roots.

THE EGG-LAYING CONTEST.

THE forty-eighth week of the contest, ending October 2 shows a production for the week of 1,667; or 227 less than the previous week. White Leghorns are responsible for the greater part of the loss; the American breeds laying a larger proportion of the eggs. Tom Barron's White Wyandottes lead the procession this week with an output of 41 eggs, A. B. Brundage's S. C. Reds being next with a score of 38; Albert T. Lenzen's White P. Rock tie with Merrythought Farms White Wyandottes for third place, each pen laying 34. Tom Barron's White Leghorns laid 33, and J. F. Francais' Barred Rocks and F. H. Benton's White Rocks laid the same number. The pen average for the week shows how the White Leghorns have fallen off as compared with the other breeds.

The S. C. Reds have averaged 22.7 eggs per pen. The Buff Wyandottes averaged 29, the White Wyandottes 26.5, the Barred Rocks 26.5, the White P. Rocks 25.3, the Buff Rocks 24, and the White Leghorns only 16.3. Francis F. Lincoln's White Leghorns have laid 2,008 eggs, laying 31 the past week. There is little doubt that this will be the winning pen. The week's score follows:

	Week	Total
Barred Rocks.		
A. B. Hall, Connecticut	25	1,327
Frank L. Tuttle, Massachusetts	32	1,392

GEO. A. COSGROVE.

A BARBER, after scraping away industriously for a few moments, made the usual inquiry: "Razor all right, sir?" "My good man, if you hadn't mentioned it, I should never have known there was a razor on my face." The barber beamed. "Thank you, sir," he said. "No," added the customer reflectively, "I should have thought you were using a file."—Chicago News.

Ducks Eating Feathers.

I HAVE a flock of 35 young ducks about 10 weeks old, and they seem to enjoy pulling feathers and down off each other and eating it. They do it so much that they often make the place bleed. They have free range with plenty of grass and are fed: Morning, dry mash consisting of three parts wheat bran, three parts wheat middlings, two parts ground oats and one part beef scrap; in the evening three parts corn, two parts wheat, two parts hulled oats. Drinking water constantly before them, open-air sleeping quarters with good shelter in wet weather. Can you tell me what to do to remedy this habit of eating feathers and down? Is there any fault with the way I am feeding? If so will you let me know how and what to do? T. D.

Coventry, R. I.

Feather pulling is usually caused by lack of meat in the food, but apparently is not so caused in this case. If the trouble is not caused by all I would advise separating the pullers from their victims and keeping them apart till they had forgotten the trick. W. H. H.

THE RURAL NEW-YORKER,
333 WEST 30th ST., NEW YORK.

PUBLISHER'S DESK

I SHIPPED one case of eggs, on June 9, to Hess, Woodward & Freund, 204 Callowhill Street, Philadelphia, Pa., commission dealers. The express company traced and said they delivered it on June 10. As they did not send the check in payment right along I wrote them and told them I could not afford to lose the amount, but they make no reply. What can you do for me?
Delaware. MRS. B. W. S.

This concern had only a limited capital to start with, and if our advice had been asked we would not have recommended shipments to them. As it was we were unable to help the inquirer out, as the investigation now shows that they left the above address some two months ago, and we are not able to locate them at this time.

Your comments on International Stock Food Company are in the right direction. That man Savage is flooding the country with flaming literature to catch the unwary, not only now, but for years past. He always has some free gift; but in the end is very careful to collect his price. Your show-up of fakes and frauds certainly does much good. A. L. W.
Ohio.

Our farmers are pretty well able to discriminate between honest propositions and the fake article. They have two guides to the latter. They have too much friendship from people they do not know; and promises of big profits. The two signs usually go together. When some gift all for nothing is tacked on there is no longer any doubt of the character of the proposition, nor should there be any hesitation about leaving it alone.

Yours with check received from Adams Express company in settlement of shipment to Georgia. You have done me a great favor, not only now but also before, greater than any other paper would have done, and as long as I have a dollar to spend for reading I shall not be without your publication. G. A. J.
New Jersey.

In regard to my claim against the Erie Railroad, which I placed in your hands a short time ago, I wish to say they have settled. I know for a fact that I would not have had the money without your aid—not for a year yet anyway. I thank you heartily for what you have done for me. I would just as soon try to farm without horses as without your paper.
New York. D. F.

Your letter and check for $7 received. Thank you very much indeed. I feel as though it was a present, for had I not given it into your hands I would have been out the whole $10. You may send me some of your trial envelopes and I will give them to friends. P. P. F.
New York.

Thanks for the check just received. If you had not sat in this game I would have received nothing, as they laughed at me before I applied to you. This is the second complaint I have made to you in twenty years and in each case you effected a settlement. P. B.
New York.

I have delayed in thanking you for your service in getting the money for the turkeys lost by the express company. My attorney kept at it, but got no reply and I gave it up as lost, but when THE R. N.-Y. got behind them they were ready to settle. M. W. T.
Virginia.

Yours with check from Adams Express to hand, and I certainly appreciate your service. I enclose check for five 10-week subscriptions and 50 cents for me. I will try to get more subscribers for you soon to help run the list up to the 200,000 you want, and think with the paper you have it ought to be in every farmer's home. T. S. G.
Florida.

The above half dozen letters are just samples of a flood of mail that comes to this department every week. They all suggest the little service that the paper is able to give subscribers in such cases. You may never have had occasion to use the service, but it is here for you in case you need it. In short, it is your service. Every subscriber has his part in creating it. Without the backing of a loyal list of subscribers no paper could give the service. So long as you are a member of THE R. N.-Y. family you may feel sure that you have helped secure redress for another farmer in cases like those referred to above.

I inclose a letter from the U. S. School of Music. It seems that you or they are misrepresenting things, and I would like to have your opinions further. W. F.
Tennessee.

Some time back this correspondent asked our opinion of the U. S. School of Music. We replied that our faith in it was not strong and that the musical authorities on whose judgment we relied, stated definitely that music could not possibly be successfully taught by mail. The inquirer also asked why the school was not advertised in THE R. N.-Y. We answer that for one reason we would not accept it.

The contents of our letter evidently found its way to the school, and its proprietor replies that Mr. Dillon is an old fogy who wants to rule over the destinies of all mankind; that in his advancing years he takes himself seriously, but that no one else does except possibly a few subscribers who are too lazy to think for themselves. Lastly he thinks it possible that Mr. Dillon has an ax to grind in the shape of a musical friend who would like to give instructions. So the correspondent comes back and wants to know who is working him to turn the grindstone. We cannot tell him any more. We did not tell him not to patronize the school. He asked our judgment, and we gave him our opinion. We asked nothing for it and would accept nothing. Perhaps it is worth no more than the cost. What we do not know about teaching music would make a book as large as the Bible; but we have no musical friend who wants to go to Tennessee to teach music. Our advice is based on information received from the leading musicians of the country. Here is one of them:

In reply to your inquiry I would say that the teaching of music by correspondence is a farce and cannot possibly produce satisfactory results. The only branch of musical instruction which can be taught by correspondence is theory.
FRANK DAMROSCH.
Institute of Musical Art, New York.

We think Mr. Damrosch pretty good authority on musical matters; but we may learn later that he too is an old fogy.

The Interstate Milk & Creamery Company, formerly the Liberman Dairy Company, of New York City, holds leases of coöperative creameries at Remsen and Barnesville, New York, and contracts for milk produced in the neighborhood. They are reported about two and a half months behind in payment; and word was received at the creameries about the first of the month to make no further deliveries. It is said that the amount due producers is in the neighborhood of $40,000. The company does not seem to be rated in the commercial books. Chattel mortgage was reported on their city effects, and altogether the prospects for the producers in those places do not seem encouraging for a prompt settlement. These sections are well protected in so much as they own their own creameries in both places. The weakness is in extending credit beyond the safety time limit. The company has been reported slow, but the returns heretofore always come, and the record favored the company in the present instance. The repetition of such experiences suggests caution in every case where milk dealers let settlements go past the date for payment. J. J. D.

The New GREENWOOD LIME and FERTILIZER DISTRIBUTER

Products, Prices and Trade.

Wholesale Prices at New York.

Week Ending Oct. 9, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with October is as follows. This is per 100 pounds in the 26-cent zone.

	1914.
October	$2.00
November	2.10
December	2.10
January	2.05
February	1.95
March	1.90

Wholesale prices paid by New York dealers are running $1.81 and $1.61 for B and C. Hotels and restaurants using two to three cans per day are paying five to 5½ cents per quart, single quart prices from bakeries and grocery stores, six to seven cents; delivered milk, nine to 10 cents.

BUTTER.

As the quality of creamery has been running better the minimum score for extras has been raised two points, to 93. It will be lowered again when the average quality of receipts warrants it. There has been a one-cent price advance on the better grades including storage, of which there is supposed to be about 7,000,000 pounds less than a year ago in the principal warehouses.

Creamery, extra above 93 score, lb	31	@	31½
Extra, 93 score	30	@	30½
Good to Choice	26	@	28

State Dairy, best	29	@	30
Common to Good	22	@	26
Ladles	19	@	22
Packing Stock	18	@	21
Process	22	@	26

Elgin, Ill., butter market 29 cents.
Philadelphia, western creamery, 31 cents.
Chicago creamery, 24@29½.

CHEESE.

There has been a decline of one-half cent on all grades, caused by weaker primary markets, particularly in the West.

Whole Milk, fresh, specials	15½	@	15½
Average fancy	14¾	@	15
Under grades	11	@	14
Daisies, Wisconsin	14	@	15
Skims, specials	12¾	@	13¼
Good to choice	11	@	12
Poor to fair	7	@	11

EGGS.

Fancy nearby eggs are scarce and three cents higher, but the market as a whole is dull and unsettled, loaded down with qualities selling from 20 to 25 cents. The estimated storage stocks in New York and Chicago are 65,000,000 dozen, but as with butter this is merely an estimate, many warehouses making no public report.

White, choice to fancy, large	43	@	45
Common to good	30	@	33

Common to good	22	@	25
Western fresh, white	29	@	34
Lower grades	18	@	20
Storage, best	23	@	24
Lower grades	18	@	22

FRESH FRUITS.

Good specimens of Alexander, Jonathan and McIntosh advanced 50 cents per barrel, and some of the standard Winter grades are 25 cents higher. Pears of good quality continue high, but a considerable proportion of the receipts run small, this is particularly true of nearby Kieffer, which have been badly pinched by the six weeks drought. Nicely packed shipments of Kieffers not larger than pullet eggs are seen, scarcely worth transportation charges. Plums and peaches scarce, the latter mainly poor. Grapes continue low, though the market is slightly improved except on white.

Apples—Alexander, bbl	1 50	@	3 00
Gravenstein	1 50	@	2 75
Duchess	1 50	@	1 75
Wealthy	1 50	@	3 00

*

The harvest of Monmouth County, New Jersey, will this year total $5,000,000, the potato crop alone bringing $2,000,000.

MARKET FOR NUTS.

Will you tell me whether there is a market for the common black walnut, such as grow on our farms; also the white walnut? About what do they bring per bushel? M. H. M.
Virginia.

There is a limited sale for black walnuts in New York and most large cities. They seldom bring more than $1 per bushel, and often only 75 cents. Candy makers use them to some extent. Butternuts sell at 50 to 75 cents per bushel, wholesale. The great drawback to their extensive use is the difficulty in cracking, an anvil or heavy stone and large hammer being needed. The price on white walnuts, or hickories, varies from 75 cents to $2.75 per bushel. A great proportion of the choice hickories never reach market, being sold locally. The percentage of these nuts of good size, thin shell and easily removed meats is small.

VALUE OF A BRAND.

THE commercial value of a brand on any food product depends on how much careful inspection the brand represents. This applies with special force to apples. For a long time it was a practice to put an imposing lot of symbols on apple barrels, XXXX, AAI, etc., supposed to represent superlative quality, when an investigation of the fruit showed that the alleged quality was only skin deep. This practice still prevails to some extent, though many States have laws forbidding such misrepresentation, and in many places where there is no law, the common sense of the grower prevents it. These exaggerated brands seldom deceive buyers, who look on them as jokes and dig deeper into the barrel in their search for culls.

Long before the western fruit associations had become successful marketing agents, individual farmers had established their own private apple brands, which were eagerly sought after. Hundreds of farm-packed barrels and boxes are daily sold in New York and other large markets, without inspection, on the farmer's mark, because the buyers have found that the mark stands for character. It may be a letter or monogram or even some peculiar pencil mark. Whatever it is its value is in the fact that buyers have translated it into quality so many times that they feel confidence in it.

The brands of fruit associations have grown in importance in proportion to the amount of unbiased inspection they are found to stand for. It was learned early that the more publicity given to the exact methods used to safeguard a brand the better, so we have been told many times how the apples are handled, no man allowed to pack his own fruit, etc. The grape growers in N. Y. State have done creditable work in building up labels that have found important places in the market.

No State has thus far been able to inspect the apple output thoroughly enough to give any guarantee of the pack as a whole, but growers who supplement the State brand with their own private marks will get whatever benefit there is in the plan. Certainly no grower or packer who has any regard for the apple industry will misuse the State brand merely because he may without being detected by the authorities. His punishment will be the low price his dishonest pack will bring, because State branded fruit will be bought on market inspection.

FARMERS SECURITY BUREAU } Superintendents, Working Foreman, Gardeners, Dairymen, Herdsmen, Farmers, Milkers, Couples, Teamsters, Farmhands, Laborers. Sidney Sullivan, Expert Agency, 99 Nassau St., N. Y. 6486 Cortland. Classed by itself.

Subscribers' Exchange

GOOD FARM 200 ACRES, fine buildings, ¼ mile of store, school, depot. EMERSON GREGORY, Owner, Bangall, Dutchess Co. N. Y.

FOR SALE—Small place, Sullivan Co., N. Y., over two acres; good buildings; adapted for chickens and truck. JOSEPH ROGERS, Farmingdale, New Jersey.

FOR SALE—Farm in rich Nehalem valley, western Oregon; great dairy and fruit region; the country of the future. For particulars write MRS. W. J. D. YOUNG, Jewell, Oregon.

FOR SALE—120-acre dairy farm with retail business, excellent markets, nearest dairy to great summer and hunting resort on Jersey coast; crops and stock included. Apply EMGE, care of R. New-Yorker.

FOR SALE—Seashore and village farm of 15½ acres, with fruit and berries; within 15 minutes' walk from ocean, and two depots; 5 minutes from school, stores and trolley; 7-room house, barn, large greenhouse. OWNER, R. F. D. 2, Box 4, Belmar, N. J.

FARM FOR SALE—Farmer's Farm, 600 acres, stocked, equipped and with 12-room furnished house; 2 tenant houses, 6 barns, silo, 3 orchards, brook, wells and springs; about half tillable; balance woods and pasture; title perfect; 100 miles N. Y. City; price $12,000, half cash. Address J. T. PETTY, R. F. D. 45, Red Hook, N. Y.

Overland $1075

MODEL 80

f. o. b. Toledo, Ohio

IN spite of the fact that this latest Overland has a much more expensive, and entirely new and much larger full stream-line body, the finest electrical equipment, left-hand drive, demountable rims, and larger tires; *in spite of the fact* that it is made throughout of all first grade materials and first grade workmanship; *in spite of the fact* that it rides—due to its longer, improved and underslung rear springs—with the smoothness and ease of the highest priced cars—*the price has not been advanced.*

Such is the perfectly natural and economical result of manufacturing the greater volume of automobiles.

Our greatly increased 1915 production has permitted us to *again* add materially to the size, comfort, value, merit, quality and completeness of the Overland *without adding one dollar to the price.*

This is an achievement which no other automobile manufacturer is in a position to accomplish.

The newest Overland is, without question or doubt, the world's most extraordinary motor car value.

Buy an Overland and save money.

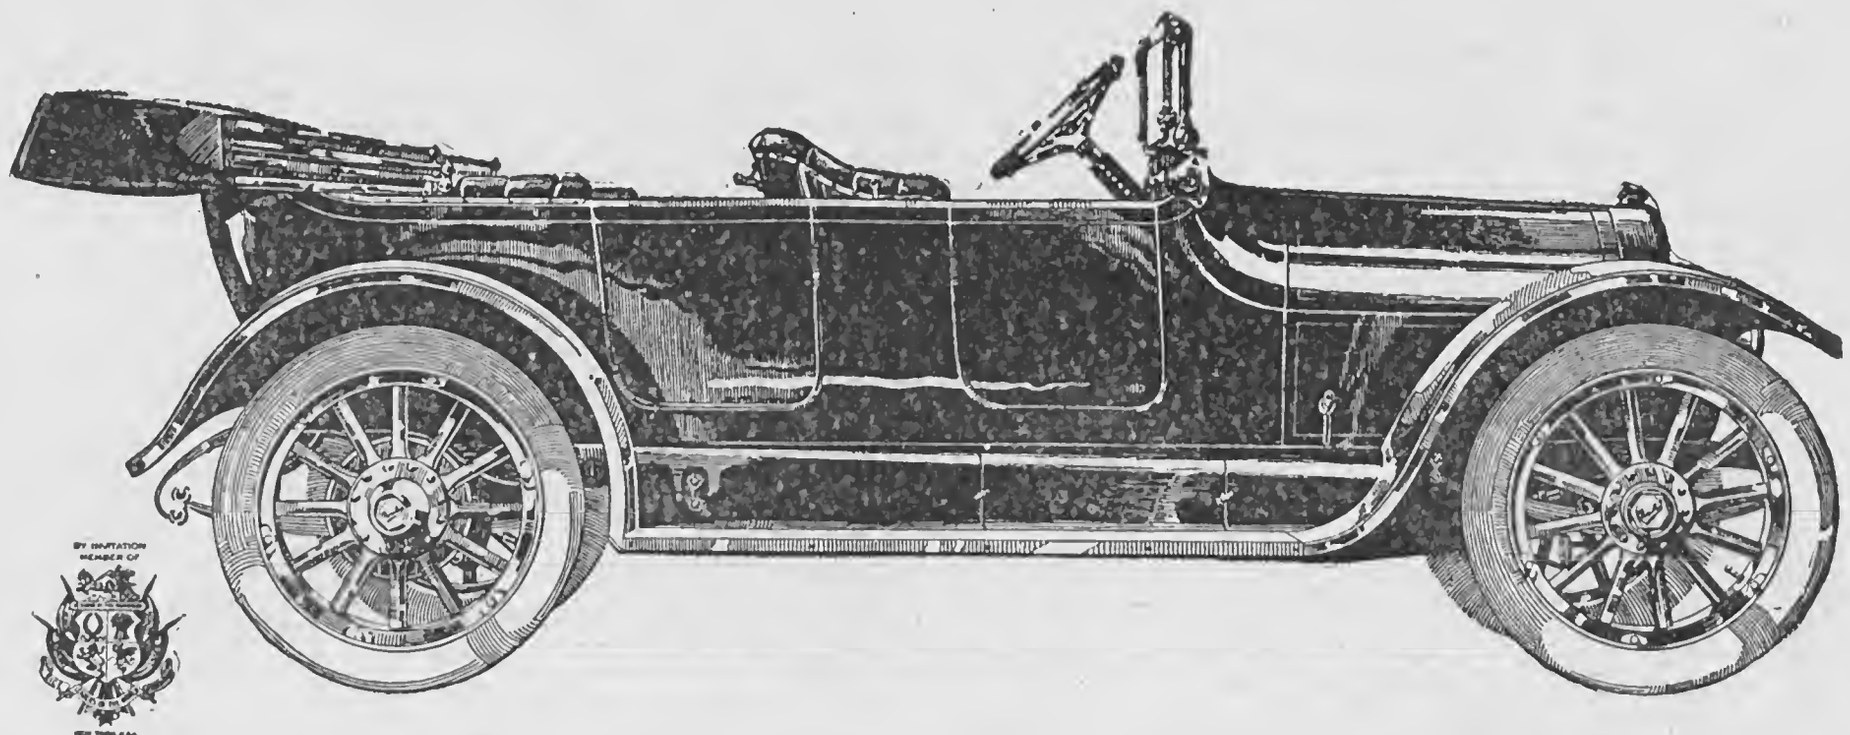
Dealers are now taking orders for immediate delivery.

Here are listed a few of the many additions, enlargements and new 1915 features

Motor; 35 h. p.
More economical
New full stream-line body
Tonneau; longer and wider
Greater comfort
Instrument board in cowl dash
Individual front seats, high backs
Upholstery; deeper and softer
Windshield; rain-vision, ventilating type, built-in
Crowned fenders
Electric starter—Electric lights
Electric horn
All electric switches on steering column
High-tension magneto—no dry cells necessary
Thermo-syphon cooling—no pump needed
Five-bearing crankshaft
Rear-axle; floating type
Rear springs; extra long, and underslung, 3-4 elliptic
Easier riding
Wheel base; 114 inches
Larger tires; 34 inch x 4 inch
Demountable rims—one extra
Left-hand drive—center control
Body:—beautiful new Brewster green finish
Mohair top and boot
High-grade magnetic speedometer
Robe rail, foot rest and curtain box

Handsome 1915 catalogue on request. Please address Dept. 127

The Willys-Overland Company, Toledo, Ohio



Model 81 Prices:
5 Passenger Touring Car - $850
2 Passenger Roadster - - $795

Two Passenger Roadster—$1050
Four Passenger Coupe—$1600
All prices f. o. b. Toledo, Ohio

Model 81 Prices:
Delivery Wagon with closed body - $895
Delivery Wagon with open body - $850

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LXXIII. No. 4278. NEW YORK, OCTOBER 24, 1914. WEEKLY $1.00 PER YEAR.

POTATO-DIGGING TIME.

"Lifting" by Horse or Hand.

THE PLEASURE OF HARVEST.—Is it work or is it play? I think it is neither. The little girl is filled with the glory of harvest. Hers is an unalloyed pleasure. As she gathers together the great smooth potatoes she thinks only of the gathering. There is no thought of the heavy disking and plowing of the ground on cold windy days; no thought of the seed cutting, disinfecting, planting, etc.; no thought of the cultivation and work with disagreeable poisons on hot dusty days; no thought of the chances taken with the elements. In fact it is nothing but pleasure, and it is the kind of pleasure that comes to a greater or less extent to every man who has the privilege of gathering the crop that he himself has grown, worked with and watched over throughout the growing season.

THE FUN OF POTATO HARVESTING. FIG. 535.

TWO POTATO CROPS.—Just now it is the Northern grower who is having this experience. Our Southern friends had their early crop of tubers off before the northern crop was in the ground, and soon they will be engaged in harvesting the second potato crop of the year. Here in South Jersey much the same thing takes place. Irish Cobblers are planted in early Spring for the first crop and Hoosiers (also known as "Pink Eye" and "No Blight") and Redskins are planted for the second crop. This second crop is destined, I believe, to work a big change in our system of cropping. One can now see many plots of these potatoes scattered throughout the entire trucking section of South Jersey. A few years ago there was none. For many years it has been a big problem to find a crop that could be grown with profit after early peas, beans, onions or strawberries had been removed. Thus far the Hoosiers and Redskins have been used mostly after strawberries. A plot of berries two or three years old, picked for the last time in late June, is plowed immediately and put in potatoes. For South Jersey planting can be done from July 1st to 15th, and in an average year the crop will fully mature before frost kills the vines. Last year we had a five-acre plot of Hoosier potatoes planted the first week in July, after strawberries, that gave a yield of over 1400 ⅝-bushel baskets of potatoes for the five acres. Less than 5% would grade as seconds. Other growers have done even better than that.

STORING THE CROP.—Because of the solidity and keeping qualities of these potatoes most of the crop is stored. To store, a pit is dug about two feet deep. Potatoes are poured in to make a conical shaped heap; this is then covered with a layer of hay, then a thick layer of soil. There is a slope to this so as to shed rain; a trench is dug around this heap or mound to allow the water to run off without entering the pit. Late potatoes stored in this manner come out solid and firm in the Spring, and can be held without cold storage until May 1st or 15th. Redskin potatoes grown here and stored as described have been taken out in the Spring and sold at the price of new potatoes from the South.

DIGGING METHODS.—Just now, however, we are interested in the best methods of digging. The little girl is not concerned with this, but with growers this problem is uppermost in their minds. For the large grower who makes potatoes his main crop there is no question but what one of the better makes of potato diggers now on the market offers the most economical means of removing his crop. Such diggers are usually drawn by four horses, and the tubers are left lying on top of the rows where they can be easily gathered in basket. Smaller growers feel that it would not be economy to buy one of these larger diggers. They must depend on small diggers or else do the work by hand. In home gardens or breeding plots for seed the old potato hook still offers the best means of getting out the tubers. Between these two classes of growers there are a vast number who produce from one to five acres of potatoes annually. We come in with this class. For removing our own crop we find the ordinary sweet potato digger or plow very satisfactory, and

less expensive for small areas than the larger diggers. The sweet potato digger has several iron rods or fingers attached to a short mold-board, and after running under a row the tubers are left fairly well exposed to the view of the men who follow and gather the potatoes in baskets.

DEEP-PLANTED POTATOES.—A sweet potato digger will not always answer for getting out the crop. Some growers prefer to plant late potatoes deeper than they do the early crop. To accomplish this they plant the potatoes as they plow, dropping the seed pieces in every third furrow. Such potatoes set very deep in the ground, and when digging a two-horse plow seems to work to best advantage. A two-horse plow set shallow will also work fairly well for digging potatoes not set so deep in the soil, but the tubers are not thrown clear of the soil as with a sweet potato digger, and the men gathering them must search around more in the soil for the loosened but uncovered potatoes. Others may use different methods of digging but, whatever the method, may we all be filled with the same joy in our work that seems to be possessed so abundantly by the little girl in the picture. TRUCKER, JR.

KILLING WEED SEED IN MANURE.

THE wise and wonderful Creator has so hedged about the continuation of species that it is impossible wholly to annihilate any. One way of perpetuating plant life is by enormous multiplication of seed. I have an instance at hand in the case of an enormous pigweed growing in a cold frame, which in four months has attained a height of 11 feet, and will undoubtedly mature several thousand seeds, or enough to make several acres so weedy that nothing else would grow. The seeds of this plant are immune to temperatures up to 150 degrees and any degree of frost, and will remain in water a number of days without injury and in all respects may be considered an average representative of a large proportion of our commonest weeds, as regards difficulty of destroying seeds by forces which destroy both wood and metal.

The age at which seeds lose vitality has not been very definitely settled except in the case of garden and field seeds and these have never been tried out in the same way Nature tests and preserves wild seeds. Weeds constantly spring up where they are not wanted, and in some cases where it is very difficult to account for. The inherent staying power of seeds makes any process expensive which will kill their germinating power. The most available way, that of heat in manure, destroys a valuable constituent of the manure's fertilizing value unless done under conditions like the hotbed, where the ammonia passes into a layer of soil and is partially used before it vanishes. Lettuce growers under glass sterilize soil to get rid of injurious bacteria by burying perforated steam pipes and steaming several hours. This also kills most of the weed seed and all the beneficial bacteria which the soil may contain.

All this is preliminary to answering the question as to destroying weed seed in manure, and answering that I do not know of any practical way of doing so except to ferment it. It is not a question that greatly interests out-of-door gardeners. As soon as rows of beets, lettuce, or other vegetables show above ground the row is straddled with a wheel-hoe and all the weeds eliminated except a very narrow strip. This matter of hoeing is as necessary in a piece of ground which has been cleared of weeds by previous culture as in a weedy one, because the ground must be stirred to get new particles of soil together as well as to prevent caking. Finally, only a tithe or less of the weeds come from manure. There are soils which have produced continuous crops of corn annually for 70 years without a particle of manure being spread upon them, yet one such field left idle for one Summer by the death of the owner produced a wonderful crop of weeds five feet high, and of more than 20 sorts, some of which were not common in that locality—the Scioto Valley.

I have never been in any location where there was not enough neglected and weed-grown land to more than stock the cultivated soil. Narrow and short-sighted methods produce weeds in variety and great abundance. The farmers in my town carefully cut the nearly ripened docks out of their meadows and deposit them in the wagon road, to be washed by rain and carried by the mud on wagon wheels and horses' ankles to a thousand places where they should not be, and would not be if they simply laid them in a little pile and killed them when dry with a little oil and fire. A meadow infested with the white-topped weed will put enough seed into the stable manure to stock a farm for a lifetime. Such a field should be plowed for corn in May, the corn followed with rye and the next year put into Alfalfa. Some day our agricultural experts will recognize weeds as plants worthy of close study, and find a way to make these intruders pay their way. L. R. PIERCE.

Ohio.

R. N.-Y.—Some of us who grow fruit have already found a way. Let them grow, cut off with the mower and pile around the trees. They make good humus.

CUTTING BACK 40-YEAR TREES.

WE have a number of Gravenstein trees about 40 years old that have been allowed to get too high for spraying and picking. Would it be profitable to cut them back and form a new head that will be within reach? R. D. P.

New Jersey.

Whether it is likely to be profitable to cut back and form heads depends entirely upon their present condition. If the trees are a good distance apart, say 38 to 40 feet, and are in a favorable location for cultivation and spraying, and are fairly vigorous, a thorough cutting back and pruning would be likely to be successful and profitable. On the other hand, if the trees are close together, say 30 feet apart, and have lost all of the lower branches because of overcrowding, with many dead and blighted branches, there is considerable doubt whether the cutting back and the forming of a new head would bring the desired results. A tree that is in good condition for improvement should have space enough in which to develop, and should have a few live branches within eight or 10 feet of the ground. If the trees have a trunk bare of branches to a height of 15 to 18 feet, it is difficult to develop good low heads upon the trees. If these trees have some fairly vigorous branches within a reasonable distance from the ground, the following suggestions for pruning can be made:

Remove all dead and diseased branches. Prune out any upright growing branches in the center of the tree that exceed a height of 20 feet, or in other words, cut back the top to side branches so that it

PEACHES, GRASS AND PULLETS. Fig. 536.

can be sprayed readily from the tower of a sprayer.

In some cases where the trees have been much weakened there may be water sprouts growing upward from the old branches. In cutting back the trees, some of these should be saved and allowed to fill the space left vacant by the pruning out of the dead and weakened branches. The lower side branches that may be left upon the trees should be pruned sufficiently to enable one to cultivate and spray the trees well. If these lower branches are very thick, they should be thinned out somewhat to permit light to enter, and if they extend to a considerable distance beyond the trunk of the tree some slight cutting back may be required. In a general way the object is to secure a shortened, but well-balanced framework, and to retain as many of the small spurs and side branches as possible. Where a large apple tree is cut back to mere stubs of branches 10 or 12 inches in diameter, and without any small side branches, it is almost impossible to form a strong and satisfactory new top upon the tree.

The pruning should be done during the Winter and early Spring before any growth takes place. Whether any fruit would be borne the season following the pruning will depend upon the condition of the trees. If the lower branches are vigorous enough to carry fruit buds there should be some fruit to mature. If the lower branches that are left after pruning are very weak little fruit is likely to be secured the first season. M. A. BLAKE.

New Jersey Exp. Station.

PEACHES, GRASS AND PULLETS.

THE picture at Fig. 536 was taken in the peach orchard of Judge F. M. Peasley of Connecticut. Judge Peasley has a large flock of White Leghorns, which run through the season on the colony system. He says he raises hay, peaches and pullets on the same land, and produces a good crop of each. The plan of keeping hens in a peach orchard is not usually favored by fruit growers, as the scratching and manuring by the hens is apt to drive the tree into too much wood growth. Where the grass is left, however, to be cut for hay, the combination makes a good one, as the growth of the hay prevents overforcing of the trees, and the pullets take pretty good care of both crops. The water and feed wagon is shown in the picture, and also the homemade brooder made out of a piano box. Some of the devices used by the Connecticut hen men to save labor and at the same time produce good stock are very ingenious, and quite worthy as evidence of brain development of the descendants of those who in former years are said to have produced wooden nutmegs and basswood hams which would really deceive a good housekeeper. There is little chance for deception, however, in the production of a good hen or pullet, for the hen is honest, and you cannot make her carry along any tricks of the hen man.

AFTER THE PEACH HARVEST.

WE just finished harvesting the biggest peach crop from our little orchard we ever had. Most of our bearing trees are four and five years old, with one lot only two years old which has a fine crop. Besides our own crop I purchased two small crops from neighboring farmers who have planted peach orchards by way of experiment. I picked and sold these for one-fourth of the proceeds. I hired a man at 16 cents an hour who did most of the picking in all the orchards. The delivering and some of the picking I did myself, thus the two of us harvested about 275 bushels of peaches with very little outside help.

The season was rather a trying one in some respects, yet on the whole I came out on my own peach crop as well as on the ones I purchased. Most of the trees were well loaded, but the dry season here caused a large proportion of undersized fruit. We thought we had thinned the fruit thoroughly, going over some trees several times as the green fruit grew larger. Yet the trees were too full, considering the dry season. Severe thinning is much more necessary when there is a lack of moisture.

The home peach market was as brisk as ever, notwithstanding we heard many complaints of the small size of the fruit. Nearly everyone wanted a few of the largest peaches, while some customers would not accept any other kind. Of course we graded them, the best grades selling for about double the price of the poorest grades. But we soon found ourselves with comparatively few bushels of really fancy fruit, while there was an abundance of the middle and lower grades. We found good sale for these latter goods, provided one would promise them some of the big fellows. This meant some careful maneuvering to get everybody supplied. Unlike other kinds of fruit here peaches do well only in certain protected localities. Again, peaches seem to be the favorite fruit of many people. As a result of these conditions we were able to secure in the home market a price for our smallest peaches about equal to the price of the best Bartlett pears. Many farmers would gladly have given three bushels of their best Fall or Winter apples in exchange for one bushel of our best peaches. Cherries, plums and grapes became so plentiful one could scarcely give them away, yet the demand for peaches kept up, though the price was not so high as for several years past.

We noticed a big difference in the size of different varieties. The Elbertas are always medium to large if the trees have a fair chance to make a crop. This variety is considered by many fruit growers as second in quality, but I find it gives excellent satisfaction, and because of its large size and beautiful yellow color is absolutely the best seller in our orchard. The Elberta is not quite so hardy nor as prolific as some other varieties, otherwise I would probably plant more of these than all other varieties combined. As it is I expect to plant more Elbertas than any other one variety. The Belle of Georgia is still holding the highest place among white peaches here. I do not yet have the Carman in bearing. The five-year-old Late Crawford trees have their first crop of fruit this year. The fruit is of good quality, but rather acid.

One of the most serious difficulties in peach growing which I have experienced is getting trees true to name. One block of Elberta trees bought from an agent whom I believed to be thoroughly reliable have been a sore disappointment to me. Only about one-fourth of the trees are true to name. When the trees arrived the tops were quite dead, but after planting, they sprouted out (as I thought) above the bud, but such a mixture of little white and yellow freestones and clings I have never seen. I now buy guaranteed trees direct from the nursery. At least I shall know where to place the responsibility if they prove untrue. DAVID PLANK.

Pennsylvania.

THE NEW YORK APPLE GRADING LAW.

What It Is, and What It May Do.

A GOOD LAW.—To begin with, I make the claim without fear of intelligent contradiction that the New York apple law, which went into effect on July 1, is the best apple-packing law ever put on the statute books of any State. It is a reasonable, understandable and workable law, and its enforcement will restore New York apples to their proper place as the standard of quality everywhere in the markets of the world, and save the apple-growing industry of the Empire State from ruin toward which it has been drifting headlong the past few years, owing to the entire absence of honest, uniform grading and packing. I believe that the dishonest packing of New York apples has cost the apple growers of this State, to speak conservatively, $3,000,000 annually. The United States (Sulzer) law is a good law, but it does not meet the situation as fully as does the New York law, and the fact that it is *optional* completely destroys its usefulness; not one in a hundred growers packed their apples under this law last year. We became convinced that the only way the growers and dealers of this State could ever be induced to pack their apples properly was to pass a law to compel them to do so. The law has only been in effect three months but it has already worked wonders. Growers of other States recognize that they are "up against the real thing," now; there is no competition that can beat New York State apples when they are properly packed. The Northwestern box apple industry is fully awake to the fact that excuse for paying fancy prices for their product in the East no longer exists. No finer apples are grown anywhere on earth than in New York, and when the consumer learns that he can safely purchase a barrel of our fruit without danger, to say nothing of a certainty, of being swindled, he will no longer hesitate to buy the apples that taste the best. Such a law was absolutely essential to keep fruit suited only for the cider mill and evaporator, out of barrels and out of the market.

DEALERS AND PACKERS.—Right here I wish to say a word in defense of the farmer, who has had to bear all the ignominy of crooked packing. There are undoubtedly some farmers who have been shortsighted and pennywise enough to pack their apples improperly, but I believe it is conservative to say that 75% of the crooked packing of New York apples has been done by dealers. During late years a large proportion of our apples have been purchased by speculators "tree run," and all the farmer has had to do with the crop was to pick it and draw it to the storage, and it has been a matter of common observation that mighty few of the apples "escaped" to the cider mill or evaporator. Year after year the fruit growers' associations have met in annual convention, discussed the situation and passed resolutions condemning the practice of poor packing, but the practice has gone on in the face of a declining export trade, and the preference shown in the markets for apples from other States, until finally last Winter a few growers who could see farther than the end of their nose took a determined stand and worked out the details of the law, drafted the bill, took it to Albany and secured its passage. There is nothing in the law to prevent a man packing his apples exactly as he has been in the habit of doing; he can put a bushel of cider apples in the middle of the barrel if he wishes to, but *he must put on the head of the barrel his name and address; the minimum size of the fruit in the barrel* and *also mark it "wormy," "scabby," "fungused," "rotten,"* etc., in accordance with the *true facts;* of course he will not do this because there is no chance left to *deceive the purchaser.*

SCOPE OF THE LAW.—Great care was taken in preparing the law to conserve the interests of the individuals concerned, the grower, the consumer and the industry in general. Four grades are provided: "Fancy," "A," "B," and "unclassified." There should be no question as to what constitutes a "fancy" apple. Any fruit that is fancy must be perfect; it must have good color for the variety, be free of all defects and of good size for the variety. Baldwin apples may be called "fancy" if every apple in the barrel is blood red and perfect, although in size they are but 2¼ inches and so marked. Kings, Twenty Ounce and other naturally large varieties could not be called "fancy" and packed to a minimum size of less than three inches. The "A" grade is intended to represent a first class No. 1 apple; the "B" grade a first class No. 2 apple, and the "Unclassified," as the term implies, apples which do not conform to the requirements of the other grades, but in the case of the "unclassified," the minimum size, and other facts representing the *true facts* covering the contents, together with the name and address of the packer must be marked on the head of the barrel. The law is intended to stop crooked packing; to put an end to deliberate deceit and fraud. Of course we may expect that every dishonest apple packer in the State will be against the law; that under one pretext or another they will endeavor at the first opportunity to have the law repealed or amended so that they may continue their nefarious business, but the decent growers of the State, the real men engaged in the industry who recognize the absolute necessity of such a law, if the great apple industry of New York is to survive, are going to fight the crooks to a finish. The practice of killing the goose that lays the golden eggs has gone on long enough; it is a question of honesty or dishonesty, of good healthy life or suicide. Let those who care to align themselves on the side of fraud and deceit, do so; they will find plenty of opposition and a tough row to hoe if they try it. The law has the unqualified endorsement of the two largest fruit growers' associations in the State, as well as that of the International Apple Shippers' Association, the secretary of which aided very materially in drafting the law.

OBJECTIONS TO THE LAW.—A certain grower came to us and said: "I can't pack my apples under this law." "Why not?" we asked. "Well," he replied, "you see in my part of the State we don't grow as fine apples as you do in Western New York, we have a lot of fungus and our apples are wormy." "What have you been doing with your apples heretofore?" I asked him. "Oh, I've been putting them in the barrel," he replied. "Well," I said, "you can continue to do so if you like; all that is necessary is that you put your name and address on the head of the barrel, also the minimum size and mark them 'fungused' and 'wormy.'" "Oh, but I can't do that you know," he replied. Of course no law is of much account if it is not enforced, but it is the intention of the real fruit growers of New York that this law shall be enforced, and it can be very easily and at little expense. Only a few intelligent, capable inspectors are necessary. The Commissioner of Agriculture is, I believe, ready and willing to do his part to enforce the statute, and if the intelligent progressive growers will all get behind the law and support it, the task will be easy, and it is *up to everyone of them to do this thing.*

DISHONEST PACKING.—The grower who is trying his best to obey the law is not the man we are after, but the fellow who does not wish to pack honestly and will not do so unless he is watched and punished, is the chap to get after. It is not going to be so hard to find these gentry, and after they have been caught and punished, the effect will be very wholesome. One very important thing this law has already accomplished, is the proper sizing of apples; hundreds of growers this Fall have purchased and are now using for the first time, apple-grading machines. These machines are not very expensive and will pay for themselves in one season on a large crop of apples, in the labor saved. To begin with they take out all the small cider apples, and easily save two men's wages doing that; then they make three or four accurate grades as to size, and this can only be properly done with a machine. It has always been a mistake to put large and small apples in the same barrel, even though the small ones were 2¼ or 2½ inches; they look a great deal better and sell a great deal better packed separately. The reports received from many markets this Fall are very gratifying. Several letters and telegrams have come to us stating: "We have never before seen such fine fruit from New York State" and "It is no trouble to sell your fruit this year." The fruit is not any better than formerly, but it is *packed right*, and for the first time the marks on the head of the barrel really *mean something.* That is the whole answer.

SETH J. T. RUSH.

RESULTS FROM DRAINING WET LAND. FIG. 537

PRODUCE ON THE WAY TO CHICAGO MARKET. FIG. 538.

FREE MARKETS AT CHICAGO.

THERE is now going on in Chicago a contest that is of interest to every man who tills the soil, and every person who makes use of the product to sustain life. The Chicago city government established in a disused school building a city market, where city people are able to buy fruits and vegetables independent of the commission men. It is a plan by which it is sought to wipe out some of the profits of the middlemen, and give the advantage to the consumer. But the commission men are on the alert; they are said to have started a propaganda by the spread of which among the growers the latter will still dispose of their stuff to the commision men, who can in turn sell it to the grocerymen. The argument of the commission men is that they have sought to keep up prices, by which the producers get more for their crops than by selling to any city market.

Despite these efforts to cut out the middleman, however, new ideas in middle dealing crop out almost every day. The other day a government worker lost his $2,300 job. Almost at once this man undertook a plan to get a profit on eggs somewhere between the hen and the consumer. I met this man on a Lake Michigan steamer the other night. He was on his way to Michigan to hire a man to buy eggs from the farmer. The ex-government clerk pays the buyer a dollar a case for buying them, the farmer ships the case to the former clerk who candles them and then sells them to the corner grocery man, who disposes of them to the consumer. The picture at Fig. 538 shows a market gardener's load which sold for $100 or more, without having to pass through the middleman's hands.

J. L. GRAFF.

DYNAMITE OR TILE FOR DRAINAGE.

WHAT DYNAMITE DOES.—Among the many modern agencies tending toward improvement in methods of solving problems that confront us on every hand dynamite holds a prominent place. In clearing our fields of those rocks and bowlders that have been used as a nucleus for unsightly stone piles frequently overgrown with bushes, loosening the sub-soil for the setting of anchor posts in fence building, breaking up the stubborn hardpan for tree planting and in clearing up new ground, it has no equal. Again, by its use large, open ditches can be dug rapidly and economically, especially if the course is through swampy land, where bushes and small trees abound. These are torn to shreds, while the earth is scattered over so wide a space that there is no high bank of earth at the side of the ditch, which must continuously keep sliding in, making it necessary to frequently reclean the ditch. In all fairness, I want to give dynamite credit for what it accomplishes, but when it is heralded as the proper agent to be used in land drainage some one has blundered. My experience and observations have led to the conclusion that as a means of drainage it is only permanently effective where the hard subsoil is underlaid with a stratum of more porous character allowing the excess of water to leach away; and even then the subsoil would, in time, revert to its former condition in a great measure. There is no aeration of the soil in drainage by the use of dynamite. The water simply lies dead and soaks away, consequently there is no sweetening of the soil.

TILE WITH DYNAMITE.—In land drainage there are three items of importance: to get rid of the excess of water, retain necessary moisture and sweeten up the soil by aeration. The results accruing from soil improvement by draining land with tile for the past 50 years or more prove conclusively that this is the proper method provided the work is properly done. I will now cite an instance where both dynamite and tile were used in the same field. In clearing off the stumps and bushes from what is called the "swamp lot" on Mr. E. E. Doty's farm two methods were tried. First, a powerful stump-puller was used, but when the huge stumps were pulled over there was much earth adhering to them, and as the subsoil was clay it was found impossible to handle them without the use of dynamite, so the stump-puller method was abandoned. By using dynamite of proper strength and quantities these were cleared out and torn apart so that there was no trouble in removing the remains, but in every instance where a big stump was blown out a deep and large basin remained. It was the intention to drain that lot last season, but the Fall was so dry this was not accomplished. The field was plowed over last Fall, as such land can be plowed, but first these pits had to be partly filled in by hand, so that the teams could get over them. I noticed that the plowmen were frequently inclined to profanity while at this stump-lot job of plowing—however, this has had no bad effect, apparently, on the crop now growing on the land.

DRAINING THE FIELD.—This Spring, 1914, we started in to drain the field, or, at least, the wettest part of it. Every pit where the stumps were blown out was filled with water, *and stayed full*. There was no settling or leaching away. The field presented the appearance of a chain of small lakes; in fact, there was as much water as land in sight. There was a line of six-inch tile running across the foot of the swamp. From this we ran a submain up through the lot, touching as many of these ponds as possible. Then the laterals were staked off, and all ditches dug down about 18 or 20 inches. What ponds were not reached by these ditches were tapped by digging little trenches to them. Then after these had drained off sufficiently to admit of further operations work began again at the outlet point. This sub-main was in depth from 2½ to 3½ feet, and had a *uniform grade* of four inches to the hundred feet. This was done so as to allow more fall in the laterals where there is always greater need of it. It was a tedious, difficult job, but the men were interested in the work, and the job was finally completed—and done right. Then came the fitting of the land, clearing off roots and stones, etc. This was no small matter. The field was then planted to Leaming corn for silo use. The picture at Fig. 537, shows the condition of the crop in August, and it is simply an immense crop. I believe both dynamite and tile drainage deserve credit for present results, the dynamite for tearing up and mixing the soil and subsoil, and the tiles for drainage and aeration. As the years roll by, tile-drained land becomes better in structural and mechanical condition, and capable of producing better crops annually, provided it is properly farmed. No other feature of soil improvement can show as profitable results. HENRY E. COX.

Fall Spraying for Peaches.

I HAVE peach orchards where ground is so wet it is late in the Spring before I can get on the land with my sprayer. Would it be advisable to spray with lime-sulphur for scale in the Fall?
Wilson, N. Y. J. S.

Yes. We should, under such circumstances, spray in late Fall or Winter with either lime-sulphur or soluble oil. On our own farm we have just such a field, and follow this plan.

Care of Paint Brushes.

WHEN paint brushes are put away with more or less paint in them, they get very hard and stiff at the base of the bristles, although kept in oil. Can you tell me how to restore them to general usefulness? I think that I have heard something about boiling in water.
Litchfield, Conn. W. W.

To soften brushes get from your druggist one pint of benzole, not benzine; stand brushes in it a few minutes, then press up and down until soft; wash them first in turpentine, followed by warm water and soap. Or get at some paint shop one pint of paint remover; it is the same thing, but has a trademarked name which adds two dollars a gallon to price; use same as above. A. F. R.

WANT TO KNOW.

CAN anyone give me the name of the originator of the Troy Market Garden sweet corn? I am very anxious to set some seed as true to original type as possible. F. B. S.
Castleton, N. Y.

CONCRETE FENCE POSTS.—Does it pay to make fence posts of concrete? If so give directions for making. E. H. A.
Virginia.

COMING FARMERS' MEETINGS.

National Dairy Show, Chicago, Ill., October 22-31. The following meetings and conventions will be held in connection with the show: American Association Creamery Butter Manufacturers, Oct. 26. Holstein-Friesian Association of America, Oct. 26. International Milk Dealers' Association, Oct. 26 and 27. Conference, Secretaries of State Dairymen's Association, Oct. 27. Official Dairy-Instructors' Association, Oct. 27. National Dairy Union, Oct. 28. American Diary Farmers' Association, Oct. 28. Council of the National Dairy Show, Oct. 28. National Association of Creamery Managers and Owners, Oct. 28. American Jersey Cattle Club, Oct. 28. National Association of Ice Cream Manufacturers Oct. 28, 29 and 30. International Association of Dairy and Milk Inspectors, Oct. 29, American Guernsey Cattle Club, Oct. 29, Congress of Marketing, Oct. 29. Milk Producers' Association, Oct. 30.

New England Fruit Show in connection with the Rhode Island Fruit Growers' Association annual meeting in Providence, R. I., November 9, 10, 11 and 12; secretary, A. M. Parmelee, Norwood, R. I.

National Grange, annual meeting, Wilmington, Del., November 11-14.

Maryland Week Exhibition, State Horticultural Society, Maryland Crop Improvement, Dairymen's and Beekeepers' Association, Baltimore, November 16-21.

Institute and convention, Lycoming County Farm Bureau, Williamsport, Pa., November 17-20.

Annual Show of the Paterson, N. J., Poultry, Pigeon and Pet Stock Association, November 18-21.

Indiana Apple Show, Tomlinson Hall, Indianapolis, Ind., November 18-24.

Mansfield Poultry Association, Mansfield, Mass., third annual exhibition, Nov. 25-28; L. Faye Howe, secretary.

Western Connecticut Poultry Association of Danbury, Conn., Inc., nineteenth annual exhibition, Hull's Armory Hall, Danbury, Nov. 26, 27, 28; secretary, Thomas Deans, 39 Hoyt St., Danbury, Conn.

Second annual seed exposition, Montana Seed Growers' Association, Bozeman, Mont., December 8-10.

Farmers' Week, Pennsylvania State College, December 28, 1914 to January 2, 1915, State College P. O., Penn.

January 9th to 15th, inclusive, 1915. Mid-Winter Exposition, Statae Fair Grounds, Columbus, Ohio, Corn Apple, Dairy and Poultry Shows combined.

Daffodil Bulbs at Special Prices

These are extra good bulbs which will give many beautiful golden yellow flowers next spring and for several seasons thereafter, if planted in the garden before the ground freezes. We will send to any part of the country

Fifty Assorted Bulbs For One Dollar, Postpaid

We have a fairly good supply, but advise ordering early if you want to secure bulbs at this special price.

Our catalogue is ready—send for a copy and see our list of Hyacinths, Tulips, Crocus, and other Bulbs for fall planting and spring blooming.

Pear Trees
AT PRICES ANYONE CAN PAY

Fraser's Tree Book (mailed free) tells what varieties of Pear trees I grow and gives prices and planting hints. I won't sell *cheap* trees at any price, but I do sell good trees at a reasonable price. If you could come to my nursery you would see with your own eyes why my Pear trees are worth more than others—they are straight, strong, big (but not overgrown) trunks, and roots that are a mass of fibres. I kept a gang of men going all summer to make these trees what they are. Write today for a copy of Fraser's Tree Book.

29 YEARS 350 ACRES.

VAN DEMAN'S FRUIT NOTES.

Tardy-bearing Pear Tree.

FIVE years ago I planted a three-year-old pear tree which has never fruited, though three years ago it blossomed. Can you tell me what to do to make the tree bear fruit? R. E. B.
Grantwood, N. J.

If the pear tree is a dwarf it is very strange that it has not borne at five years from planting, but if it is a standard, which is very probable, it is not strange. Therefore it is not to be wondered at that no bloom has appeared except the little that came at one time. If after waiting a year or so longer no bloom appears it would be well to investigate the matter. There are great differences in the time of beginning to bear among the varieties of pears and as the name of this tree is not given it is impossible to give an opinion as to what should be expected of it.

Sweet Cherries on Mazzard.

I HAVE read that the reason our heart or sweet cherry trees do not last well is that the stocks they are budded on are unsuitable. Are Mazzard stocks a wild sweet cherry? W. J. H.
Raritan, N. J.

It is quite true that the main reason for the failure of many of the sweet cherry trees that were grown and sold by nurserymen is that they are on Mahaleb stocks, which is only suitable for the sour varieties. The cherry trees that are very common over many of the Atlantic States, New Jersey among them, and are often called a "wild" cherry, because they come up over the fields and along fence rows, are of the European sweet or Mazzard species. This is the parent of the good sweet varieties and is very suitable to use as a stock for them.

Transplanting Apple and Pear Trees.

WHAT do you think of transplanting apple and pear trees, 12 of each, that were planted in a row two years ago this Fall? I would like to plant English Morello cherry instead, as these were planted along a fence line, and wish to transfer apple and pear trees to a different row with several hundred different varieties this Fall. Would it be safe to transplant these apple and pear trees? A. W. G.
Perrysville, Pa.

I would say that it would be safe to transplant the apple and pear trees by taking them up very carefully, so as not to injure their roots more than is absolutely necessary. One very important point in the transplanting is to pack the soil between and over the roots very firmly. This insures the moisture in the roots being kept in the normal condition and injury from the drying influences of the Winter will not result.

Hybridization by Grafting.

A FRIEND here claims to have produced hybrid apples by inserting scions after their buds had opened, and that others have secured similar results, asserting that unless scions are dormant the fruit will partake of characteristics of both stock and scion. Can you cite any experimental data on this question? E. G. B.
Fredericksburg, Va.

There is not a particle of truth in the theory that hybrids can be made by grafting diverse varieties together. This has been disproven many millions of times by grafting and budding in nursery and everywhere and over the whole range of trees and plants, from pines to potatoes. Not a trace of the supposed transmission of varietal characteristics has been noticed in my own experience of over 50 years of budding and grafting, but entirely the reverse. And I have done the work at all possible times of year, including the active season of growth; nor have I ever had others who have had abundant experience to report a single case of that kind. Varietal or individual traits or peculiarities are transmitted through their sexual organs only. This is the law of nature in both animal and vegetable life. The resulting crosses show the blending of the traits of their parents. Grafting does not blend the varieties, nor does it blend the wood. Where a pear graft or bud joins onto a quince stock, as occurs on every dwarf pear tree, one is pear and the other is quince wood, quince sap, quince foliage (if there should be sprouts below the union), and above all is pear wood, pear sap, pear foliage, and pear fruit of the size, shape, color, flavor and season of the variety used. It is so with all of the other innumerable cases of grafting and budding that I have ever seen or heard of on good authority. All the contrary reports, so far as investigated, have been mere guesses or stretches of the imagination.

H. E. VAN DEMAN.

CROP REPORTS.

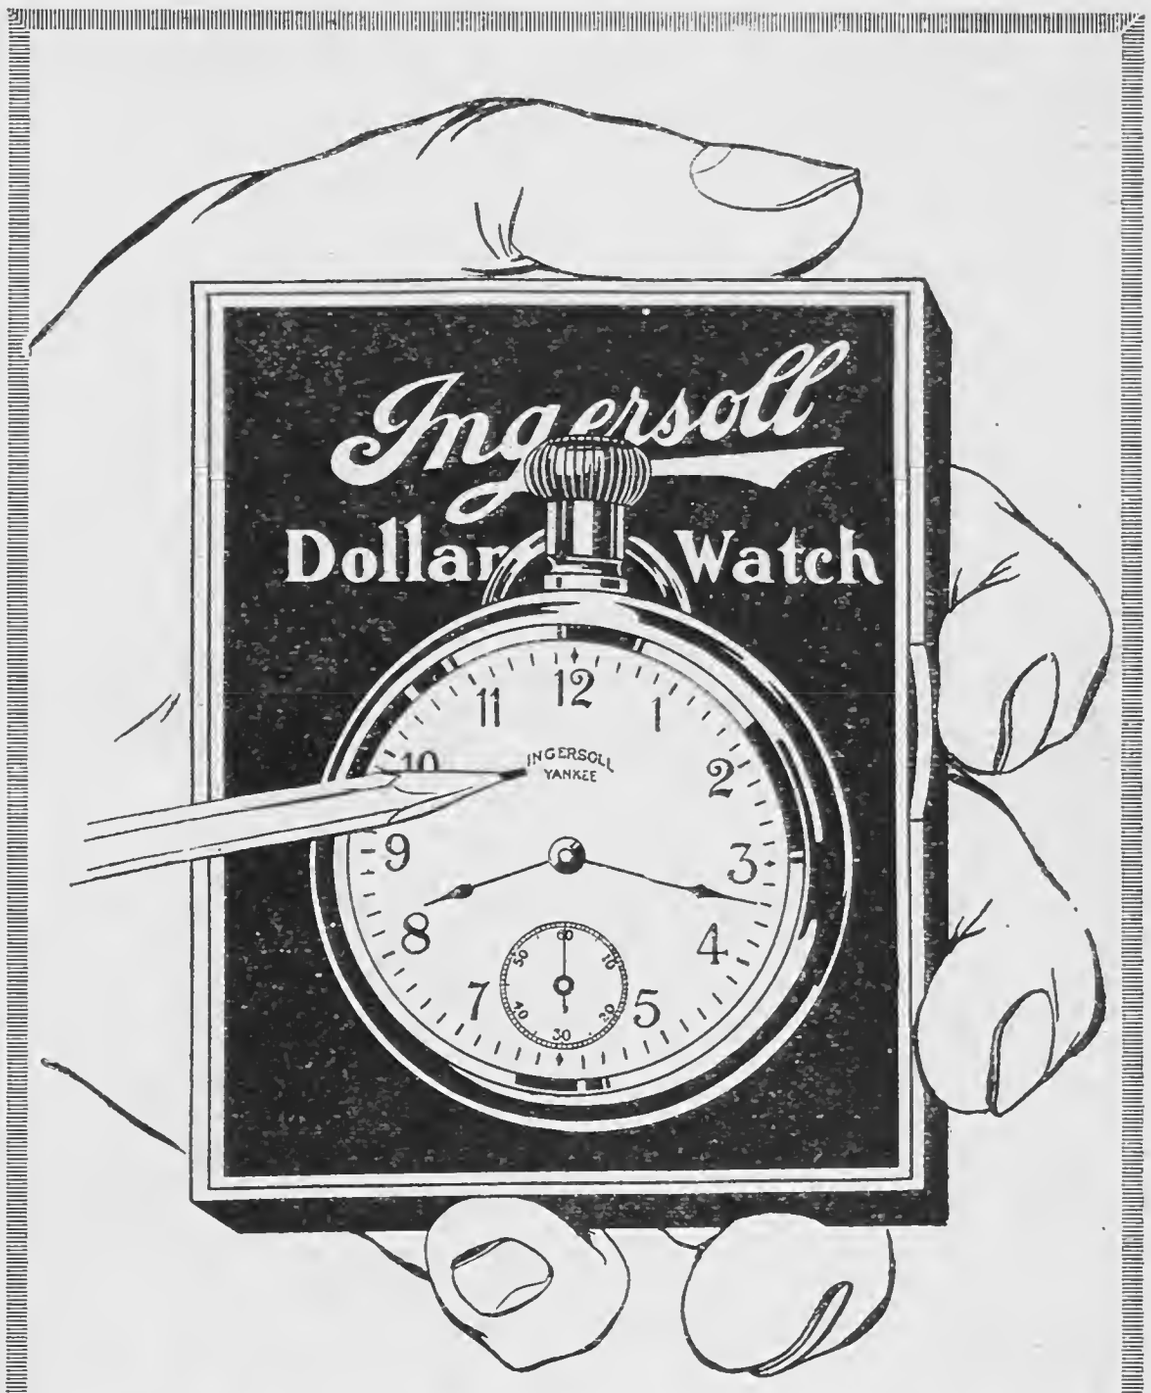
Oct. 10. Prices paid to farmers: hay $14 (loose) and $15 for baled; butter 22; eggs 26; potatoes 70; veal calves $8 to $8.50. I. W.
Coshocton, O.

Oct. 4 and no frost. Corn is still green on the stalk. Grass is green and flowers blooming everywhere. Plenty of rain all Summer and Fall. Pastures good. Hay crop is plentiful while corn and oats are up to average or better. Farmers are keeping usual number of cows, but are not buying any new ones. We raise our own cows through here and sell the surplus. Butterfat is high and pork, the main by-product of dairying here, is standing at a good figure.
White Bear, Minn. R. F.

Oct. 12. Crop conditions in this territory are normal. A drought of long duration, which dried up many springs and killed pastures, was broken by copious rain Oct. 10. Crops were good, hay a full crop and corporations offering $15 f. o. b. destination for it; potatoes coming out clean and of extra quality, selling for 65 to 80. Apples are a bountiful crop and supply exceeds demand, hence price low. Such as are prepared to pick and preserve for late delivery will get better prices. Oats 60; buckwheat 70; rye 85. Farm sales well attended and good prices obtained. Horses are lower in price and other live stock, especially cows and swine, are in larger demand. Fall grain about the normal acreage, and looks well considering the dry spell just over. Rye still being seeded. Hay bales and thrashers are busy, $1 per ton for baling and 2½ to four cents for thrashing charged for the work, the farmer to furnish all extra help and board the entire force. About 18 tons per day the average. L. E. K.
Ebensburg, Pa.

Oct. 6. Conditions are comparatively favorable in Jefferson County at the present time. The weather continues warm, there has been no frost and stock is running on wild pasture which is still yielding good feed. Wheat seeding is still going on. A majority of our farmers delayed seeding until late, hoping thereby to avoid Hessian fly, which was prevalent over a large territory this season. The wheat crop was thrashed early from the shock and a large share of it was marketed direct from the thrasher at 62 to 65 per bushel. It has since brought $1, but went off again and is now selling at 85. A large acreage is being sown this Fall. The corn in a large part of this county is fairly good, but east of here to the Missouri River it is a very poor crop, on account of lack of rain. Oats were the best crop in years, and selling at 40. Potatoes are a fair crop, selling at 80. Many carloads will be brought in here from Wisconsin, the Red River country, and Northwest Nebraska. Only two good cuttings of Alfalfa were put up this season, rainfall being too light to make much of the third crop. Stock cattle are increasing in number slowly. Such cattle are selling at 6½ cents to feeders. Hogs are scarce; fat ones selling at present at eight cents. Hay appears to be plenty at $8 to $10 per ton. Country butter 20; eggs 20. Apples were a complete failure here. The orchards are dead over a large region, trees that were set years ago and have never paid the taxes on the land they occupied.
Fairbury, Nebr. H. M. R.

Oct. 8. The principal crops raised here are sweet corn and tomatoes, for which the canners pay $11 per ton for corn and 30 cents per bushel for tomatoes. I did not raise either as crops, am selling a few fine tomatoes at 50 cents per bushel. I sold some sweet corn at one cent per ear. Summer apples 50 per bushel; peaches sold from $1 to $1.10 per bushel. There is no sale at present for apples. Wheat has run from 80 cents to $1; had an offer of 68 cents for my wheat, and was asked $7 per barrel for flour by same dealers. I sold part of my wheat at 80 and had the balance ground for hog feed. Hogs are selling at $9 per cwt. on foot or 20 cents added per cwt. dressed. Dairy products are low compared to other localities and in proportion to price of feed. Milk sells at six cents a quart delivered. Butter now 30; all Summer was from 16 to 20; eggs same price as butter. I have my experience relative to price of cottonseed meal, which I think should be investigated. I came here from Virginia last November, had been paying $1.50 per cwt. Our local dealer here charged me $2.25. Some time ago I read an article in the "Breeder Gazette" extolling the merits of cottonseed meal for dairy cows and deploring the fact that it was not more universally used by our dairymen in this country, while so much of it was exported, the price mentioned in the article was $25 per ton. If that is the price in quantity, why should it retail at $45? G. A. S.
Aberdeen, Md.



The Watch for the Man Outdoors

This is the watch that 40,000,000 people have found to be a reliable timekeeper.

It is the watch for business men, physicians, mechanics, farmers, and all practical men who decide that what they want in a watch is accurate timekeeping.

The Ingersoll is particularly a better watch for use where it is subjected to hard knocks, or exposure to dust, rain, or any bad weather.

And the Ingersoll can be bought in any store anywhere—on Broadway, New York, or at any little crossroad store in America; and the price is the same wherever you find it—One Dollar.

Look sharp for the name "Ingersoll" on the dial—the mark of the good timekeeper.

ROBT. H. INGERSOLL & BRO., 315 Fourth Avenue, New York

EVENTS OF THE WEEK.

DOMESTIC.—Three were killed and 14 persons seriously injured, Oct. 12, as the result of the wrecking of a Denver and Rio Grande train 16 miles from Grand Junction, Colo. The wreck was caused by a 20-ton boulder falling from a precipice and crashing through one of the cars of the train.

The entire business district of Spencer, W. Va., was destroyed by fire, Oct. 12, with a loss of approximately $300,000. The fire started in a fruit store and spread rapidly because there was no water with which to fight the flames. Little rain has fallen throughout this section in the last two months.

Thirty hungry sailors who experienced a narrow escape from starvation on the sea reached New York, Oct. 12, aboard the schooner Alice Lord, long overdue from St. Martens, in the Danish West Indies. The little vessel had been driven by a hurricane nearly one thousand miles from her course. For five days the only rations her sailors had were a plate of bean soup and two or three pancakes apiece.

University Hall at Columbia University, New York, was practically destroyed by fire, Oct. 10. The loss is estimated at $250,000.

Mrs. Annette Abbot Adams, the first woman to be appointed an Assistant United States District Attorney, took the oath of office at San Francisco, Cal., Oct. 13, in the Federal Court. Mrs. Adams immediately went about her duties as fourth assistant to John W. Preston, United States District Attorney for Northern California.

An attempt to wreck St. Patrick's Cathedral, New York City, with a bomb, Oct. 13, was followed at midnight by a similar attempt in St. Alphonsus Roman Catholic Church, at 312 West Broadway, near Grand Street. It was supposed that the two explosions were caused by the same person.

Washington, Oct. 12.—Assistant Surgeon L. W. Jenkins and five others were drowned when a boat from the revenue cutter Manning was swamped in a bad sea in Unalga Pass, off Cape Sariches, Saturday, according to a radiogram received today from the commander of the Bering Sea fleet. The boat was returning with a sick man from the lighthouse at that point when the accident happened.

James J. Farmer, Colonel William J. Hartley, Samuel F. Warfield and others and the Anglo-American Authors' Association, of 225 Fifth Ave., New York, were put on trial in this city, Oct. 13, on indictments charging the use of the mails in the operation of a scheme to defraud. According to the postal authorities, the defendants reaped profits amounting to nearly $10,000,000 in three or four years from the sale of ornate editions of classic and modern authors. Men and women of wealth have been led to pay enormous prices for volumes which they could have purchased from reliable booksellers for one-third or sometimes one-tenth of the price charged by the Anglo-American Authors' Association. Two of the men concerned pleaded guilty, Oct. 14.

FARM AND GARDEN.—In the boys' corn contest held at the Lancaster, Pa., Fair, Albert O. Bruckart of Lititz won first prize on White Dent corn in a class of 13 exhibitors. He was also awarded the grand champion prize of $10 in gold for the best 10 ears in the entire contest. There were 89 contestants from all parts of the county.

Consular Agent E. J. White reports as follows on fox farming from White Horse, Canada: "While the fox markets of eastern Canada, principally in New Brunswick and Prince Edward Island, are practically the same as last year, the prices paid here for young foxes this season are only about one-quarter of those paid last year. This is due to a law passed by the Yukon Territorial Legislature in March, 1914, providing that a fox from the wild state must be kept in captivity two years before it can be exported. Animals born in captivity may be exported at any time. As the majority of the young foxes captured are taken by Indians who are not prepared to keep them for any length of time they are bought by 'fox farmers,' of whom there are now about twelve in Yukon Territory, and kept by them until such time as they may be legally exported. The result of the passage of the law forbidding the exportation of captured young foxes has prevented outsiders from buying for immediate exportation, as was done in previous years, and in consequence prices are now much lower. A silver gray pup three months old, which one year ago brought $800 to $1,050, now sells for $150 to $250."

The Vegetable Growers' Association of America opened its seventh annual convention in Philadelphia October 6, to continue four days. The president, W. J. Ritterskamp, Princeton, Ill., introduced an interesting programme, which included lectures, essays, and tours to places of trade interest.

Another government nursery is being planned at the Great Plains Experiment Station, near Mandan, N. D.

The first annual institute and convention of the Lycoming County Farm Bureau will be held at Williamsport, Pa., November 17-20. In connection with this exhibit there will be held the fourth annual display of the Lycoming County Apple Growers' Society; the fourth annual display of the Holstein-Friesian Cattle Association; the seventh annual exhibition of the Williamsport Poultry Association and an official display, demonstration and institute of the Pennsylvania State College. Premium list may be obtained from Wm. S. Milliner, City Hall, Williamsport, Pa.

The Maryland Week Exhibition will be held at the Fifth Regiment Armory, Baltimore, November 17-21. It will be, as last year, under the auspices of the Maryland State Horticultural Society, and affiliated with this organization will be the Maryland Crop Improvement Association, Maryland State Dairymen's Association and Maryland State Beekeepers' Association. In the order named, these organizations will hold their annual meetings on Wednesday, Thursday, Friday and Saturday, with three sessions daily, in the Armory gymnasium. The formal opening on Tuesday night will be with an appropriate programme in which national government, State, city and various rural interests will be represented.

THE EUROPEAN WAR.—Antwerp surrendered Oct. 9, after a heroic defense, and is now occupied by the Germans. The King and Queen, and the entire Belgian army, with its British auxiliaries, escaped to Ostend. A great proportion of the civil population fled to Holland, across the Scheldt. It was reported, Oct. 12, however, that several Antwerp forts still held out. The German government has notified Holland that it will not disturb the neutral status of the river Scheldt.....The government of Belgium, with no place of safety, has abandoned the country, and its administrative offices are removed to Havre, on French soil. One reason for this was the dropping of aerial bombs on Ostend. King Albert has remained at Ostend to command the army.....

The University of Louvain has accepted the offer of the University of Cambridge, England, to continue its work there. .....Oct. 10, the Russian cruiser Pallada was sunk in the Baltic Sea by a German torpedo.....The British consul at Warsaw has asked the American consul to take over his office there, and it is believed that the capture of the city by the Germans is imminent..... The forty-four lists of losses in the Prussian army which have been published contain a total of 211,000 killed, wounded and missing, according to a Reuter dispatch from Amsterdam. The lists do not include losses among the Bavarians, Saxons and Wurtemburgians.....Oct. 11 Germans made another aerial raid on Paris, dropping bombs at several points, but doing little damage. One bomb struck the Cathedral of Notre Dame.....The campaign on the Aisne, called the Battle of the Five Rivers, continues; the Allies have advanced to Ypres, Belgium..... King Charles of Rumania died Oct. 10, aged 75. He had kept his country strictly neutral, but it is now believed that the country will side with the Allies.....Martial law has been proclaimed throughout the Union of South Africa as a result of a rebellion in the northern part of the Cape Province, which adjoins German Southwest Africa. Lieut. Col. Maritz, a Boer officer with a number of his officers and men, has gone over to the German forces..... The Japanese and Germans have agreed on a brief armistice to bury the dead at Kiao-Chau. The Governor of the territory is endeavoring to arrange for the departure of all non-combatants remaining in Tsing-tau.....Portugal began mobilizing troops, Oct. 15, and is expected to declare war on Germany. It is believed Portugal will be active in Africa.

BUFFALO MARKETS.

HOME-GROWN grapes are $30 per ton and 11 to 12 cents for seven-pound baskets. Apples of the home crop are not quoted at more than $2 a barrel, wholesale, with fair to good at 20 to 30 cents a bushel. It still looks as though part of the local crop would not be picked. Pears are $3 to $4.50 per barrel wholesale. Quinces of rather poor quality retail at 40 cents a third-bushel basket. There is a good supply of prunes at 30 to 35 cents per six-pound baskets. Potatoes are down again, 50 cents a bushel wholesale and 65 cents retail. The crop in this section promises to be large. Onions are 60 to 65 cents per bushel, fancy. Cabbage is $1 to $2.50 per 100. Beans are high, $4 per bushel for Marrow. There are still string beans, at 75 cents to $1.25 per bushel. This is a great chestnut year, northern nuts wholesaling at eight cents per pound and sometimes retailing as low as 10 cents a quart. Butter and eggs are higher, but cheese is dull and a trifle lower. Best creamery butter wholesales at 33 cents, fair grades at 26 cents. Cheese is 14 to 17 cents per pound, fair to best being about a cent off from last year and two cents from a year ago at wholesaling centers. J. W. C.

HUDSON Six-40-$1550

The Winning Class Car

For several years, among leading designers, a new-type car has been rapidly evolving. It came in response to motorists' demands. It began with the trend toward Sixes.

The aim was to remedy crudities and to end all over-tax.

That meant light weight. It meant economy of fuel. It meant artistic lines, ideal equipment. And it meant a reduction in quality prices. Most late-year efforts among high-grade designers have been bent in those directions.

Howard E. Coffin Started in 1910

Four years ago, Howard E. Coffin, the great Hudson designer, began to develop this Hudson Six-40 as the ideal coming type. During all those years he has had working with him 47 other engineers.

Part by part, detail by detail, they worked out their final refinements. Now this Hudson Six-40 for 1915 shows their finished conception of the new-day car.

They have saved about 1000 pounds in weight, by better materials and better designing. They have saved about 30 per cent in fuel by a new-type, small-bore motor. They have devised and adopted countless new attractions in beauty and comfort, in equipment and convenience. Their car of today represents the last word in modern motor car engineering.

Last year, by efficiency, they brought the price down to $1750. That broke every record on a quality car. This year, with a trebled output, they brought it to $1550. Now, at this price, which once denoted a low-grade car, you can buy this prince of class cars.

$3,875,000 Last Month

Note what a welcome men have accorded this masterpiece of Howard E. Coffin.

In June, when our first-year Six-40 was all sold out, we had 3000 unfilled orders. On August 1, 30 days after the new model appeared, we had 4000 buyers waiting. Yet our output had been trebled.

In September, motorists paid for this Hudson Six-40 $3,875,000. We built five times as many cars as in September a year ago. Yet we could not keep up with orders.

Now this model outsells any car in the world with a price above $1200.

Thus the Hudson Six-40 has become the leader among all the new-type class cars. The verdict of buyers, as shown by sales, is that no rival compares with it. Men waited weeks for this model when other cars were plentiful. It has multiplied Hudson popularity five-fold inside of a single year.

Go see this car now. Next year's models of all makes are out now, and this is the time to choose. Get your new car for fall driving; for the best motoring months of the year. Your dealer will see that you get prompt delivery, if we have to ship by express.

Phaeton, with two extra disappearing seats, $1550 f. o. b. Detroit.

Canadian price, $2100 f. o. b. Detroit, duty paid.

Hudson dealers are everywhere.

Red Hook, N. Y.

NEW BUSINESS FOR FARMERS.

WE have a report of a Massachusetts man, who lives back among the hills where there was not much business. Among other things, he had a little store, and has been depending upon the stage or farmers' wagon for hauling home his goods. Finally he tried an experiment with an auto truck. With this, he was able to make rapid trips to the county town and come back quickly with such goods as he needed. He was able in this way not only to supply his own goods, but do errands for the neighbors, and also carry passengers. This latter business finally developed very well, and he has established a regular route and a time for traveling back and forth between his country village and the town. By adopting a regular route and timing himself, so that people may know when he would reach certain points, he has developed a steady business, and people along the way are greatly accommodated by this service. This is only one example of the way country people are making use of these automobiles and trucks. There are a good many localities where, for a long time, people have impatiently waited for a railroad or a trolley service. In many cases, the cost of establishing such service would be altogether too great for the returns, but by making use of large automobiles or trucks, people in these outlying towns may be well served in the transportation of both passengers and freight. Another man that we hear of in a New England college town has developed a business of buying second hand furniture from farmers and others and selling it at a fair price, after cleaning and repairing, to college students. All sorts of things are being tried out in the way of developing a business, and many of them are succeeding in the line of putting to profitable use, things that would otherwise be thrown away. We have all got to remember that profit in modern business is now made by saving and utilizing things or opportunities which were formerly not considered or wasted.

How to Store Seed Potatoes.

SEVERAL of our readers have asked us for the best method of storing potatoes, in order to obtain fairly good seed for next year. These persons want to use selected seed of their own growing and have the ordinary farm facilities for handling seed. What would you advise such persons to do with their seed in order to hold it to the best advantage?

Prime essential is to keep tubers from freezing and dormant until planting. I have never enjoyed other facilities than dwelling-house frost-proof cellars, but utilize every weather advantage of temperature to get them cooled down to 35 degrees as soon as possible and keep them there. I obtain desired temperature by opening to outside air when cool and closing when warm. I do not think excessively moist air desirable, nor ventilation. I prefer dry soil at digging and no exposure to sun. I was for ten years a potato dealer, and the best kept potatoes I ever handled were from an unused dwelling cellar that had been heavily banked well up against house and unopened until July 1; cellar bottom was earth, neither wet or dry. My customers in absence of assurance to contrary, believed them of that season's growth.

New York. E. A. HILL.

On storing my seed potatoes I put them in the house cellar when dug and leave out the cellar windows until freezing weather, but cover the windows during the day to keep cellar dark. The idea is to keep them in a dark place and at a low temperature, 35 to 40 degrees, and then they keep dormant and firm; warm cellars would be liable to cause them to heat and start decay and lower the vitality of the seed. In a long, cold spell I have seen the frost stand on the cellar walls on the north side of the cellar, but does no harm unless it gets cold enough to freeze the potatoes, which it does not. Keep them dark and in a cool place for good seed. W. L. HANNAH.

Maine.

Since we are growing a variety of early potatoes which sprout early in the Spring, and since we do not wish to plant until about June 1, it is a problem to store the seed in such a way that the sprouts will remain dormant until a short time before planting. For a number of years we stored the seeds in a house cellar, but the vitality of the seed was very often seriously injured by early sprouting. We have, therefore, adopted a method of wintering our seed potatoes out of doors in a pile covered with alternate layers of straw and dirt. We choose a well-drained spot for the pile, preferably on the north side of a building where it will not be exposed to the sun. We set up two boards on edge, four feet apart, and pile between these boards all the potatoes that we can, making an A-shape pile as long as is necessary to store the number of potatoes we wish for seed. Then beginning at the base of the pile we place forkfuls of straw about one foot thick, lapping them carefully so there will be no thin places. We build up each side of the pile in this way, and finally lay forkfuls of straw along the ridge. Then we cover this pile with about four inches of dirt, which we allow to freeze. The dirt may be taken from the ground near the pile, but not nearer than three feet to it. After the first layer of dirt is frozen we put on another layer of straw like the first, then a layer of about six inches of dirt. In a normal Winter the pile will go through with this covering without any loss from freezing, but it will be safer after the last layer of dirt has frozen to pile on more straw, corn husks or any material which is handy in order to protect the pile from too severe cold, and to keep the layers of earth frozen until late in the Spring.

A cool day should be chosen for making the pile, so that the potatoes will be cool when they are stored. If this point is not observed the pile may heat and potatoes start into growth. We have no difficulty in keeping potatoes stored in this way until May 20 in a perfectly dormant condition. I would advise anyone who contemplates trying this method to be very careful in getting the layers of straw and dirt evenly distributed and of uniform thickness. If this is done and the potatoes put into piles when cool, and the first layer of dirt allowed to freeze before the second one is put on you may expect the seed to keep perfectly.

Vermont. E. S. BRIGHAM.

R. N.-Y.—Let everyone remember that this advice is for a cold country like Northern Vermont. If the pile is put up properly and the seed put into the pile when cool this is the best method for storing seed potatoes in cold climates. It would not, however, do farther south, where Winters are warm, and it may be rather dangerous to recommend to people for fear that they will not be careful in putting on the layers of straw and dirt according to directions.

A FARMER living not far from Boston was disappointed the other day when Mrs. Blank, one of his regular customers, refused to buy any more eggs from him. "They are not satisfactory," she told him. "Some of the last lot were not fit to use." "But, Mrs. Blank," remonstrated the old man, "a hen is bound to lay a bad egg now and ag'in."—Boston Transcript.

Paid $105.00 for a Studebaker wagon 38 years ago

IN 1876, Mr. R. F. Dewey, of Millersburg, Ind. bought a Studebaker Farm Wagon for $105.00. Mr. Dewey writes:

"I have a Studebaker wagon that I purchased of E. A. Welch in Goshen in the spring of 1876. I paid $105.00 for it. It was a high wheeled, narrow tired wagon when I got it but I later had it cut down and made into a wide tread. I am still using the wagon on my 160 acre farm, 8 1-2 miles southeast of Goshen. It has had all sorts of hard work. At present I am using it to haul cordwood."

COST HIM $2.77 A YEAR

Figure it out yourself. Divide the cost of the wagon, $105.00, by thirty-eight years and you will see that Mr. Dewey has been paying in the neighborhood of $2.77 a year for his farm wagon—or about three quarters of a cent a day.

Think of the money that this wagon has earned for Mr. Dewey and the money it will continue to earn, because every year's life added to 38, still further cuts down the cost of the wagon.

But that is the way with a Studebaker wagon. Built of air dried lumber and tested iron they outlast other so called "Standard" farm wagons by many years. Studebaker wheels alone are a guarantee of long life. The slope shoulder spokes, the carefully pinned felloes, the inspected hubs all contribute to wearing qualities and ability to stand up under hard work.

You can buy cheaper wagons than Studebaker's. But no wagons made have the reputation for lasting as long as Studebaker's.

Studebaker Buggies and Harness carry the same high standard of excellence as Studebaker Wagons.

Feed Grinding and Wood Cutting

In the Winter every farmer finds himself beset with numerous jobs—big and small—every-day jobs and occasional ones. This is where an efficient, reliable power plant is a time and money saver.

The "Badger" Engine is made well from start to finish; made to run without interruption; not merely to sell.

It is simple—anybody can run it or adjust it. It is economical, using less gas or gasoline than any engine known. It develops more power than rated. There are many types and sizes of "Badgers" to suit every individual need. Any BADGER is a GOOD engine.

The "Badger" is always ready to run—Winter or Summer—at an instant's notice. **Every part guaranteed for five years unconditionally.**

GASOLINE ENGINES

Hope Farm Notes

HOPE FARM "HENS."—Let us call them "hens," out of consideration of the feelings of those who say they are not "scrubs." I went up to Storrs on Oct. 10 to look over the contest and make arrangements for the "Favorite Hens." My birds are there, happy and lively—though most of them are molting. Naturally they have tapered off on the egg yield, but it looks as if they would reach 1,300 eggs by November 1. Now I want to give their individual record up to Oct. 1 so that we may see that even "hens" as well as pure bloods may be drones or lazy members.

THE HOPE FARM "HENS."
Record from Nov. 1, 1913 to Oct. 1, 1914.

	1	2	3	4	5	6	7	8	9	10
Nov.	0	0	0	0	0	0	0	0	0	0
Dec.	0	0	0	0	0	0	0	0	0	0
Jan.	0	6	0	0	0	0	0	7	0	0
Feb.	0	10	0	6	1	5	0	14	9	0
Mar.	10	17	6	14	5	12	17	17	22	15
April	18	23	19	14	21	21	15	17	20	20
May	21	22	23	21	28	25	13	19	22	19
June	7	19	22	19	21	19	11	18	23	9
July	18	21	20	18	12	15	4	10	25	22
Aug.	13	20	17	8	16	10	15	20	26	21
Sept.	4	4	0	0	12	20	4	16	22	8
Total	91	142	107	100	116	127	79	138	169	114

There were enough eggs laid outside the nest to make a total of 1,250 up to Oct. 1. As for feed, these 10 hens consumed up to Sept. 19, 484 pounds of dry mash and 612 pounds of grain. This covers 313 days, and makes a little less than 25 ounces of mash and 31 ounces of grain per day for the 10 hens, or 2½ ounces of mash and a trifle over three ounces of grain per day for each hen. These hens also consumed a little over eight pounds of grit, four pounds of charcoal and 25½ pounds of shells. I will not figure profit or loss on the hens until Nov. 1, when the full year's record is completed.

There is a wide margin between the record of No. 9 and that of No. 7. No. 9 is a good White Leghorn. Judge Card scored her 90 points. No. 7 is a mongrel showing marks of several breeds, with Brown Leghorn perhaps predominating. I picked her as the best one in the pen—she has turned out to be the drone. Yet you see she went about 140 days before laying an egg. That adds to the glory of No. 9. She went over 100 days without laying. Take her record since March 1. In 214 days she has laid 160 eggs. She is still laying, and will probably reach 175 eggs by Nov. 1. No. 8 began laying in January, but fell down later on. Here is another mongrel with Red blood dominating. The Leghorns average 142 eggs, the Rock culls average 98, and the mongrels 122. As you see they all waited nearly 100 days before laying an egg, for they were in very poor condition when they reached the contest. Their record is really for nine months. Now these hens are to be carried on another year under the same conditions of feeding and care. We shall see what they do next year. My belief is that they will lay more eggs by 200 than they have this year. I base this prediction on the fact that they are now in very much better condition than they were one year ago. They will, I think, start off promptly after recovering from their molt and keep it up. Now then, who says my "hens" will not reach 1,500 eggs next year? I did not expect them to lay over 750 in this contest. Now, I am inclined to back them to double that figure. Remember they will be bred to two different cockerels during the season!

DOUBLE CROPPING.—You will remember that we plowed up a five-year-old strawberry bed after this year's picking, and about July 4 planted potatoes on the sod. These potatoes were dug during the first week of October. It was a light yield, as we evidently did not use the right kind of seed. When the potatoes were dug we chopped up the soil with the harrows, fitted it well and set out strong layer plants of strawberries in rows three feet apart and two feet in the row. These plants are starting off, though the soil is very dry. I do not claim that these plants will give a crop next year. They will bear a few fine berries, but will make a better growth if we can carry them through the Winter than Spring-set plants. But see what we are doing. On land very suitable to the strawberry we get five good crops. The ground is plowed and fitted by growing potatoes. Then it comes back, the same year, into strawberries again—the crop best adapted to the land. Next year, if we like we can run a row or two of lettuce or early beets along the rows of strawberries while the latter are growing.

MAKING BARN INTO HENHOUSE.—As usual I am after information, and as usual I go right to the fountain's head. Can I take a regular country barn and by lining it with tarred paper or anything else, make it comfortable for White Leghorn hens in Winter, and make it so comfortable the hens will lay in cold Winter weather? What would it be best to line it with? A. R. P.
New York.

Yes, you can line such a house with thick tarred paper so it will be comfortable. The chief thing is to keep out the wind and prevent draughts. We should batten the cracks over, and then tack the tarred paper over the inside so as to leave, if possible, an air space of about three inches between the wall and the paper. Make both airtight if possible. I should try to make the walls of such a hen barn not unlike an icehouse—making the inside tight and warm, and then attending to the fresh air problem. While you can make such a building comfortable, it is another thing to make the hens lay. It is not the barn, but the man who becomes responsible for that.

NOTICES.—Several people have asked me to reprint a notice which is sometimes pasted up on the barndoor at Hope Farm. I presume they mean the following. The suggestive treatment is often better than attempts at prohibition. It surely seems to me ridiculously inconsistent for a man to try to prohibit others from doing just what he does himself. For example, think of a man who uses tobacco freely commanding his boys not to smoke cigarettes!

NOTICE

THE HOPE FARM MAN

is quite capable of drinking all the liquor, doing all the fighting and all the swearing that will ever be necessary on this Farm.

He could also, if necessary, tell most of the stories and find use for all needed tobacco.

Business Hours belong to the Boss!

COW ON BOUGHT FEED.—Can a cow be kept without a loss where all feed is bought and there is no pasturage on or near the home? G. B. G.
Wilmington, Mass.

I should figure in such a case that I should be obliged to feed the equivalent of 2½ tons of hay and 3,000 pounds of grain to keep the cow one year. If this were all bought it would cost in this section about $95. The cost of a cow would be $75 or more. I should figure at least 10 per cent. for yearly depreciation in value. Labor, rent, medicines and similar expenses would come to $15 at least, or a total of $117.50 as year's outgo. Now if your milk costs you eight cents a quart to buy, your cow would have to give, say 1,500 quarts, to pay her way. At six cents this would be 2,000 quarts. If you have a garden the manure could be used to advantage, and the wastes from corn and beans or the tops of roots or vines will all help cut down the cost of food. In our own case the cow will make use of much roughage which could not be otherwise used profitably. The chances are that it will cost you $125 or more to take care of a single cow. A good one ought to be profitable if you put little or no value on your own labor, and have shelter for her so that it will not be necessary to build.

CRAB GRASS.—We have had considerable to say about crab grass lately—among the rest a note about this pest in a lawn. The following note is from Dr. W. J. Beal—the most noted farm botanist in the country. Years ago the Hope Farm man studied botany under Dr. Beal, but as we see without much fame to student or teacher:

"I mail a specimen of one common sort of crab grass, Digitaria humifusa, or Panicum glabrum, often bad in lawns, an annual grass, everything except seeds dying in the Fall. Your note on page 1149 must mean witch grass or quack grass. When I tell my son-in-law some points in botany or horticulture I say as I do to you, 'This is instruction that I neglected to drill into you when you were my student.' To get rid of either species of crab grass make the lawn richer and the better lawn grasses will keep Mr. Crab out. Crab grass is also known as finger grass." W. J. BEAL.

I will testify that Dr. Beal did his full duty. He drilled hard with a strong arm and a good drill, but I fear he struck a head so hard that it turned the edge of the drill. H. W. C.

The Comfort *Baby's* Morning Dip

"GOODNESS KNOWS," says the Comfort Baby's Grandmother, "what we'd do without this Perfection Smokeless Oil Heater.

"If I'd only had one when you were a baby, you'd have been saved many a cold and croupy spell."

Landscape Gardening as a Profession.

WILL you advise me as to how I should proceed to learn the profession of landscape architect? How long would it take, and what are the possibilities? I have a natural taste for it.
New York. J. J. R.

Take the course in landscape gardening at Cornell University; after graduating from there secure employment with some good firm making a specialty of landscape gardening, which will be necessary for the rounding out of your knowledge of the work. There is very much to learn in this profession. One must not only know how to draw plans for the improvement of the landscape, but he must have a thorough knowledge of all the species and varieties of trees, shrubs and plants generally used in the adornment of the house grounds, public parks, cemeteries, etc., as to their habits, height of growth, color of foliage, time of blooming and color of flower, that he may group them or use them as single specimens in a pleasing and harmonious manner. The length of time required to acquire this knowledge cannot be accurately estimated, as so much depends upon circumstances in each individual case. A natural love and aptitude for the profession will be much in favor of the aspirant, hard work and close application to the studies will also have a tendency to shorten the period of qualifying for the profession, but at best several years of hard study and practical work will be necessary before you can become a professional landscape gardener.

This is one profession that does not seem to be over-supplied with good practical men, and is undoubtedly more promising than most of the older and more common professions. Landscape gardening in America has scarcely advanced beyond the infant period. The next 25 years will witness vast strides along this line of work, and good landscape men will be in great demand at very attractive and lucrative figures for their advice and work. By all means go ahead and acquire the profession if you can possibly do so. K.

Roses Choked by Stock.

WHAT is the matter with my roses? I am enclosing samples, so you will understand better what I mean. The garden was planted with best roses that could be bought. The first and second year they did finely, but since that time they have been steadily going back, that is, what I call growing wild. Every new shoot that came up is like the sample, and instead of the beautiful double flowers I only have single ones. This rose garden has the best of care in the Fall, before hard freezing, it is given a heavy mulch of oak leaves and well rotted stable manure; in the Spring the coarse mulch is taken off and the fine is forked on; they are gone over thoroughly and pruned of all dead wood, but they are still going back all the time. T. W.
Tarrytown, N. Y.

The twigs sent are the brier rose, and the whole trouble is that the bud has been choked out by the stock on which it is budded. In planting budded roses they should always be set with the collar—the point at which the union is made—two inches below the surface; this gives the graft a chance to form, in time, its own root system, and also lessens the chance of winter-killing at the point of union. Even with this deeper planting the stock will throw up a good many shoots, in some cases, and these must always be cut out as soon as they show, or they will certainly choke out the less vigorous graft. The brier rose has seven leaflets, the stems covered with small thorns, like those sent us, and this is easily distinguished. The Manetti rose, also much used for stock, has few thorns, three to five leaflets, sometimes seven. These "wild" shoots usually come up on the outside of the plant, and it is quite easy to detect them; if you feel uncertain follow the shoot down to its point of growth, and rub the bud right off. We have grown budded roses for years without ever having the experience complained of, but they have been set deep and every suspicious shoot removed, in the few cases where they have formed. Anyone who plants roses should notice whether they are on their own roots or not. Such a wholesale disappointment as that described by T. W. is very rare; yet it may easily occur if the persons managing the rose garden have no suspicion that the stock is thus strangling its foster offspring. Of course the only thing to do is to dig out these roses, and either replace them with own-root stock, or utilize this unhappy experience in the care of any worked plants used.

Eradicating Woodbine.

WHAT is the best way to get rid of woodbine vines? They are near a dividing wood fence between two yards. I thought I would dig the roots of the vine out this Fall and again in the Spring. Is there anything more that could be done to kill them? C. H. T.
Hartford, Conn.

Woodbine is the popular name of Lonicera grata, one of our native honeysuckles. The name is also inappropriately applied to Bignonia radicans (Chinese trumpet vine) and Ampelopsis quinquefolia (Virginia creeper, five-leaved ivy). All these species of vines are very tenacious of life and very difficult to eradicate, as almost every piece of root left in the ground will sooner or later send up sprouts and shortly become an established thrifty plant. The best method of eradicating them is to grub out the plants, digging the ground over thoroughly, picking out and casting aside every piece of root brought to view, which work should be done this Fall. Next year if any sprouts appear, they should be chopped out promptly. If none is allowed to grow during the Summer, it is possible that the plants may be entirely eradicated by Fall. K.

Selecting Lima-bean Seed.

THE New Jersey Experiment Station has sometimes had complaints to the effect that lima beans have been growing less productive or later in season year by year. If it is true that some growers save their seed from what is left of the crop after the marketing season is over, this state of affairs is little to be wondered at. Seed set late in the season is apt to be poor of germination and growth because cool weather and weakened plants are not likely to produce strong seed. More than this, seed saved from the last of the crop is more apt to come from late than from early plants, as the latter have by that time yielded their best product. Seed for sowing should be borne by the plant at the height of the season, or better still, all the seed of selected productive plants may be saved.

Most growers reject discolored seed, and that which is under size or misshapen. Special care should be taken in this direction during the present season, because a disease that badly spots the pods has done some damage in bean growing sections. Many pods so spotted give seeds of a pale yellow or brownish color. The Experiment Station specialists in plant diseases say that although this spot may not wholly destroy the seed or may not be transmitted through the seed, beans so diseased may give weak, early growth and, if the planting season be cool, are more apt to rot in the ground.

THE hundred and twentieth inquirer: "What is the matter, constable?" P. C.: "Motor-bus ran over a cat, mum." Hundred and twentieth: "Oh, dear me! Was the cat in the street, constable?" P. C.: "No, mum, the motor-bus chased it up the lamp-post."—Melbourne Australasian.

You'll like VELLASTIC Union Suits for the warmth of their velvety fleece and the comfort of their snug, form-fashioned fit.

VELLASTIC

Ribbed Fleece-Lined Underwear

All that its name implies—soft like velvet, and elastic. Medium in weight—maximum in satisfaction. The inner fleece won't wash away—won't knot—won't mat. Doctors recommend VELLASTIC as an underwear that wards off colds.

For Men, Women and Children

Union Suits or Separate Garments at 50c and up. VELLASTIC Union Suits are perfection in fit and comfort. Look for the name VELLASTIC.

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates, 75 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. We use every possible precaution and admit the advertising of reliable houses only. But to make doubly sure, we will make good any loss to paid subscribers sustained by trusting any deliberate swindler, irresponsible advertisers or misleading advertisements in our columns, and any such swindler will be publicly exposed. We are also often called upon to adjust differences or mistakes between our subscribers and honest, responsible houses, whether advertisers or not. We willingly use our good offices to this end, but such cases should not be confused with dishonest transactions. We protect subscribers against rogues, but we will not be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and to identify it, you should mention THE RURAL NEW-YORKER when writing the advertiser.

UP and down through the Hudson Valley large quantities of rye are grown. Years ago in the upper valley rye straw was a standard and profitable crop. It is now to a less extent. In late years green manures and cover crops have become popular and most of us come to believe that no matter what other seed we use it pays to put in some rye to make sure. This season a company of farmers organized to buy and sell produce and supplies. They had, combined, a large quantity of rye. On sending samples to a large milling concern they found that their rye contained garlic. Such rye (with garlic) was quoted at 80 cents, while rye free from garlic brought 96 cents. Here was a difference of 16 cents a bushel, or 20 per cent. of the price lost through foul grain. Here is something for the Hudson Valley farmer far more important than the European War. The farmer cannot influence the war, but he can clean up his seed! Much of this trouble is due to the common practice of borrowing or changing seed with the neighbors, and not fanning or cleaning it in any way. In the company of farmers here mentioned this loss from unclean rye seed reached nearly $1,000!

*

DURING the past few weeks the inhabitants of Belgium have given the world an example of fierce, bulldog courage in defense of their country. We are not discussing their motives or the justice of their cause, but referring to the fighting quality of men whose ancestors made even the great Cæsar turn back, and this is why we refer to it. A few years ago we had a visit from a scientific gentleman who had spent some years studying conditions in Europe. This man said that the Belgians were becoming a weak, effeminate race—"a race of old women" was the way he put it. This was due to diet, he said. The average Belgian rarely ate "good red meat," but lived upon vegetables, bread, cheese and eggs or poultry. Such a diet would tame any nation, and take the fighting spirit out of them. Our friend claimed that only the large meat-eating nations would show any patriotism—"potatoes and pullets make a tame dog—not a fighter!" It looks as if the Belgians had eaten a few roast bantam roosters along with their potatoes and pullets! It does not make so much difference what a man eats. It is the spirit of the man that counts. Nine-tenths of the people who reach 40 years would be far better off if they cut half the meat out of their diet.

*

EVERY week we are asked to help settle a milk trouble which results from a dispute over testing. The milk in question is bought on the basis of its per cent. of fat—the testing being done by the buyer. Sometimes the dairyman feels that he does not get a fair showing—that the test is not accurate. A fraction of one per cent. of fat in a month's supply of milk will make a big difference to a farmer, and cutting down the multiplier in this way is a serious thing. In New York State, when a farmer is not satisfied that he is getting a square deal he can apply to the Department of Agriculture. An inspector will come and sample the milk, and it will be analyzed by the State's chemist. Yet this is not always satisfactory, as in such a dispute it is a contest between two inspectors and two chemists. A better way is for the dairyman to obtain a Babcock tester and learn how to operate it accurately. This will enable him to check off the record so that he may be sure of his ground. It is the same principle of having a good pair of scales at home and weighing feed or seed as it is received, or farm produce as it is sold. Without the milk tester and the scales the buyer or seller has all the advantage in dealing with a farmer. With these implements and a good knowledge of their use the farmer can protect himself.

IN an ordinary season this might be considered very early to talk about buying seeds for next year. It is no ordinary season, however, and our advice to careful gardeners and farmers is to start now in bargaining for a seed supply. The war in Europe has involved several countries which supply large quantities of seeds. In some cases these seeds will not be furnished at all—in others they cannot be as carefully selected or handled as would be the case in time of peace. Those who order first will have best chance at the true seed supply and run less risk of obtaining "misfits" or adulterated seeds. Again, in such a season as this one is to be, farmers should be careful to have samples of their seeds tested by the experiment stations or the Agricultural Department. There will be a rush of this work later. The stations can do careful work for you this Fall and early Winter. There never was a season when it paid to hunt for "cheap" seeds, but this year the folly of doing so is greater than ever. Our advice is to patronize a reliable seedsman of long standing reputation and to make out your order early.

*

THE Land Bank of New York is now a reality. The Board of Directors held its first meeting at Albany on Friday, Oct. 16. The Land Bank has the full $100,000 capital pledged—the subscribing associations representing total assets of $20,000,000. The bank will be open to do business as soon as the legal papers are executed. Money will then be available for loans on farms and homes in this State. The names of the first Board of Directors follow:

John J. Dillon, New York.
Edwin F. Howell, New York.
Robert B. Van Cortlandt, Mount Kisco.
William H. Judson, New York.
Charles S. Folsom, New York.
George F. Flandereaux, New Rochelle.
David B. Hutton, Brooklyn.
James P. Judge, Brooklyn.
Benjamin Thompson, Brooklyn.
Bernard G. Parker, Gouverneur.
Edgar A. Newell, Ogdensburgh.
Elmer E. Stanton, Troy.
Frank D. Kingsbury, Corning.
W. C. Cooper, Oswego.
J. C. Farnwell, Geneva.

These directors will serve until the first annual meeting in January, when a new Board will be elected by the members. The first three are elected from the State at large, the others represent the four judicial districts of the State—three directors from each. The stupidity of politicians was revealed in an incident connected with this meeting. While the directors were arranging for the opening of the bank the city papers which fear that Governor Glynn will get credit for the Land Bank, were busy writing editorials to discredit it; and the directors on reaching the street after completing their arrangements, read in the Albany papers that the Land Bank would never be organized. Here is an institution to benefit all classes, purely coöperative, and generally demanded; yet these blind partisans think they can kill it with sneers. They would show more sense if they joined the Governor and other supporters of the Land Bank, and demanded credit for a share in it.

*

THE business of growing hickorynuts in New England ought to be made as large and profitable an enterprise as growing pecans in Louisiana or walnuts in California. No one questions the immense development of these last-named enterprises. Without question somewhere off in the woods are to be found varieties of hickories far superior to those now picked and sold. Compare the present hickory situation with that of apple growers before such varieties as Baldwin, Grimes or Greening appeared. Farmers grew mostly a few inferior varieties, or had orchards of natural seedling fruit. Some one, wandering in the woods, discovered a tree with fine, superior red apples. It became known as Baldwin, and its wood used for propagation was carried far and wide, changing the entire character of New England apple growing. New England nut-growing will in time be changed and improved in much the same way. Superior hickory trees will be found and tested, and the coming nut grower will learn how to use the wood of the high class nuts for propagating trees. We have every confidence that this will be done until some day the New England hickory will rank with the California walnut and the Southern pecan as representing a large industry. Every man who knows of any superior hickory tree should notify the Northern Nut Growers' Association. He will not obtain wealth by doing so, but he will do more—help a good cause.

WEST VIRGINIA has a law under which agents of the State Crop Pest Commission are authorized to enter private property and cut down cedar trees which carry their share of the cedar and apple rust disease. This plant disease, like some others, passes parts of its life on two different plants. Part of its development is made upon cedar trees—from which it is carried to the apple, where it often causes great damage. It is often difficult for farmers to realize this fact of the part played by cedar trees, and when the crop pest agents came to cut the diseased cedars down some of them were arrested and indicted for malicious trespass and conspiracy. Suit was also brought asking for an injunction to prevent further action of this sort by the Crop Pest Commission. The argument was that this law was unconstitutional, since it interfered with the rights of private property. At the trials of these cases it was necessary for the scientific experts to demonstrate the true character of the rust disease. They were obliged to prove that the cedar was its "host plant," and that it could not be developed and spread unless there were cedar trees reasonably near the apple orchards. This they succeeded in doing, and the cases were dismissed. The court has now decided that the law is constitutional, and that the State has a right to enter property and destroy the cedar trees on the theory that by harboring the rust disease they are a menace to the apple growing industry.

*

WHEN Tom Barron was at the egg contest last July, he invited American breeders to enter an English contest which starts at Burnley, Lancashire, on October 28. American hen men will be glad to know that Francis F. Lincoln has sent a pen of his Leghorns to measure eggs with the English birds. Mr. Lincoln's hens are now ahead in the American contest, and seem likely to win out, though the Wyandottes are after them and gaining. Every American will send good wishes along with the Lincoln Leghorns. They are American bred, and they carry a great American name. In this English contest six hens are entered. Three of them are to be kept in a small house—holding a dozen or so—while the other three are to be in a long house where half the birds in the contest are located. The object of this evidently is to test both systems of hen-keeping. Prizes are to be given on the basis of market values (weight considered)—not merely numbers of eggs. THE R. N.-Y. will give the record of these American invaders from time to time. If other American breeders have entered we shall be glad to record their names.

*

THE great problem is the marketing or reaching the market. We are much interested in the accounts in THE R. N.-Y. about the public markets. It is hard to be satisfied to take 30 cents per bushel for potatoes, the price now paid here by buyers. We hope to get a little nearer the consumer later and will hold ours. I.

This report comes from Livingston Co., N. Y. The average consumer here in New York is paying close to $1.50 for potatoes right now. This is partly because purchases are made in small quantities—half a peck or even less, but the facts are beyond question. Yet even now we have people who say there is no such thing as a "35-cent dollar." The new public markets are waking up the city people. That is about all they can hope to do for a time, but it is the most important thing of all. Just as soon as the city people realize that they are paying three prices for their food and that they can save one price by more direct dealing they will change their habits of buying. It is a matter of education first of all. Most of these city buyers read nothing but the daily paper, and their education will come largely through that. The daily paper follows whatever is popular. Popularity comes through discussion and thinking. Keep talking public markets!

BREVITIES.

"KILLING the goose that lays the golden egg." Some men would be better off if this goose were killed and they had to get down to brass tacks.

THE Kansas Agricultural College has gone to jail—about 130 inmates of the Leavenworth Federal Prison taking the correspondence study work from the college.

GOV. WALSH of Massachusetts has called off the open season for hunting in that State as a measure of protection against forest fires. The drought has made the woods as dry as tinder.

A WOMAN reader asks us the blunt question—"Do you believe the statements made in the advertisements about success in squab breeding?" We have not read such literature for some time. The last we read seemed to be a pure fake. The author surely took the readers for the softest kind of squabs that ever craved pigeon milk. Some people tell us they make a profit from squab raising. For the untried beginner we think it a dream.

A PUBLIC MARKET IN POUGHKEEPSIE, N. Y.

THE women of the Housewives' League and the farmers of the Dutchess County Coöperative Association had an enthusiastic meeting in the Court House, Poughkeepsie, on Thursday evening, October 14th. The immediate reason for this particular meeting was the opening of a producers' open market in one of the open spaces of the city during the past week. This departure came into action largely through the local members of the Housewives' League. Local growers during the present season have been receiving from 30 to 50 per cent. less for their produce than they got last year; while the housewives complained that they were paying more this season than a year ago. This resulted in a demand on the local authorities for opportunity for farmers to display their goods in an open market and to sell them direct to the people. Farmers came with their fruit and vegetables and were all sold out long before noon. The result was repeated day after day for five days, and then an opposition to the open markets developed by the local dealers. They distributed printed circulars attacking the open markets and advised their customers not to patronize them. Neither the growers nor the women wanted any local dispute or hard feeling; and the meeting was called and everybody invited in the hope that a better understanding might be reached.

The complaint from the producers' and consumers' side was that dealers insisted on wanting a level of prices even when the surplus was greatest and in that way restricted consumption of cheap products; and while denying the consumer the benefit of surplus prices, caused the goods to rot on the farmers' hands because there was no demand for them commensurate with the supply. It was charged that because of this state of affairs we have hungry children in the cities, while the best food in the world is rotting on the ground within a few miles of the empty kitchens of the town and city. Numerous instances were quoted to show that the price paid the producer bore no corresponding relation to the price charged the consumer. Individual dealers in different parts of Poughkeepsie offered different prices for the same grade of produce, and there being no standard of prices, farmers refused to bring goods to Poughkeepsie markets unless contracted for in advance. This worked to the disadvantage of the consumer.

The dealers contended that the housewives were partly to blame for high prices, because they exacted an expensive delivery service. They also complained that farmers were largely to blame in not properly packing and grading produce for local markets.

It was an intelligent and enthusiastic meeting, well represented by the three classes of producers, distributors and consumers. The general consensus was that the cost of distribution is higher than it should be; and the only question of contention was the means by which extravagance and waste could be eliminated.

The open market is only a temporary expedient. A dozen or 15 farm wagons were at the market Thursday morning. They had choice, fresh goods, and the women were buying at reasonable prices. But the open wagon only changed one form of extravagance for another. If the producers had a covered market and packing house combined, three men could receive all their goods and handle them and sell them to better advantage than the 15 men, teams and wagons. The organized coöperative market would permit the farmers to unload their produce, and go home with their teams while their representatives made the sales, and took proper care of the goods. The need of such local markets and packing and grading and storing facilities is apparent in every village and city of the State and country. There is no other way to save waste and reduce cost. Governor Glynn provided for the organization of these local associations and markets as part of the system contemplated in the new Food and Markets Department. He secured an appropriation of $20,000 for the initial work in organization and this work is now going on; but of course the State cannot be expected to provide the buildings nor the operation of the markets. It is probable, however, that the Land Bank will be in a position to assist farmers in the financing of the building for local market purposes. Plans are already under consideration for a permanent covered market in Poughkeepsie, and from the temper of the people, and the progressive spirit of both farmers and housewives in that vicinity, the prediction is made that the market will soon become a reality. J. J. D.

WORKING OFF THE APPLE CROP.

ALL over the country where apples are grown the producers are alive to the fact that they must exert themselves to get rid of their fruit. No one is going to do it for them. The cotton growers have troubles of their own and serious ones at that. There is a movement on foot urging people to buy a bale of cotton and thus help finance the crop. Even the moving picture shows have been brought into this campaign, and night after night throughout the large cities pictures are shown of the growing of the cotton crop and the great need of selling the vast quantity now on hand. Those of us who grow apples must make a similar personal and popular campaign in order to get rid of our fruit. Foreign shipments will be cut off to a great extent, but there are people enough in this country to eat every apple we can grow and look around for more, if we can let them know about the fruit. The South offers a great opportunity in this line. Some of the Southern storekeepers are waking up to the fact. Here, for instance is an advertisement which appears in a local paper printed in Georgia:

In that country apples are almost a novelty, and

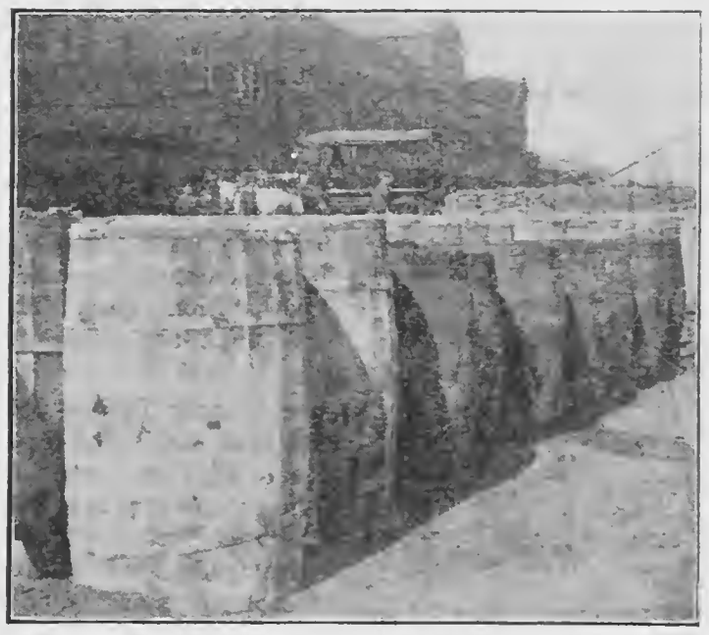
WILLIAMS COMMISSION CO.

rarely eaten by the common people. They ought to be eaten more freely than bananas or oranges and they would be, if our growers would wake up, and like the Western apple men, stand ready to give a fair share of their crop for the purposes of advertising. We must not only resort to advertising but to song and story as well in order to get rid of our fruit. The Rochester people announce apple day with its demand that every one who lives anywhere near that city shall eat apples and eat many of them too. There will be



BARRELS OF ROSIN AND TURPENTINE.

speeches and stories and songs in addition to apples and among others the following song is announced:

Seems like I'm crazy for apples—
Been without any so long;
Now that it's time for the fruit to be prime,
Say, I just burst into song.

Other fruit's good in its season,
But, ah, how I welcome the Fall,
That part of the year when the apples are here
The bulliest fruit of them all.

There's a tang to the taste of an apple,
A zest like the keen Autumn breeze,
With a savor that's won from the smile of the sun
When it ripened the fruit on the trees.

Oh, I've hungered and thirsted for apples,
With the appetite keen of a boy,
And the season which brings in this viand of kings
For me is a reason of joy.

For Autumn means rosy-cheeked apples,
And apples mean cider and pie,
And dumplings and such which you can' praise too much.
No matter how hard you may try

So here's to his Highness the Apple.
Who comes with the crispness of Fall,
When my palate's athrill as I take in my fill
Of the bulliest fruit of them all!

No one seems to have fitted a tune to it yet, but that is a small matter in a campaign like this. The point is for every man who has apples for sale this year to grade them properly, put only the best on the market and talk apples and sing apples and eat apples wherever he goes, whether indoors or out. That is the way to move popular thought, and nothing except popular thought can get rid of our fruit this year.

Pine Tree Products.

THE picture shows turpentine and rosin just unloaded at New York from a Savannah steamer. There were about 600 barrels of turpentine and 300 of rosin in the lot. The rosin is in the long irregular shaped barrels, which are made of rough material and can be used but once.

New York State News.

MANY NEW GRANGES.—New York has organized 36 new Granges during the year ending September 30. The total number organized the country over is 490, and 28 have been reorganized. There has been a great growth in membership in the West, as we find that Kansas has 68 new Granges, Nebraska 57, Ohio 55, Washington 28, and North Dakota 26. In the East, Pennsylvania leads, with 38 new and seven reorganized Granges.

HOW THE LAW WORKS.—The new compensation law is being "operated" diligently these days but there is no hope of the Commission ever catching up with their work. The law has been in operation now three months and about 4,000 cases have been settled out of 18,000 claims filed. If the same rate of progress continues, the end of the year will find 16,000 claims disposed of and 64,000 still pending.

PROF. FLICK ADDRESSES HOLSTEIN MEN.—The Holstein-Friesian Club of Syracuse at its recent smoker given at a Syracuse hotel, heard Prof. A. C. Flick of Syracuse University on the effect of the European War on the Holstein industry of Holland. After discussing the war at length, he declared that America, not Holland, would be the center of the Holstein industry in the future. He believes that Holland will have to send all its cattle to the block to keep up the food supply. A committee from the Holstein-Friesian Club of New York was present and discussed means for getting larger returns in the milk business. It is the plan of the committee to get in touch with the Dairymen's League and the Housewives' League, in regard to this matter.

FRUIT GROWING THAT PAYS.—Last week the writer visited the fruit farm of A. Jansen in Ulster County. It is not a large farm, only about 1,200 trees in the apple orchards, but it is exceeding profitable. Last year he marketed 2,500 barrels but this year the crop will not exceed half that number. We found Mr. Jansen and his men running the sorter on a lot of McIntosh Reds that were sold at $4 per barrel; this when most growers are wondering how they can get $1.50 for their crop. This latter price is what Mr. Jansen gets for windfalls. He doesn't believe in sending windfalls to the cider mill when the assorted fruit, scarcely differing from the picked, will bring $1.50. He does not sell windfalls as picked fruit, but labels the barrels in large letters WINDFALLS, and the consumer knows he is getting windfalls. Last year McIntosh sold for $6 in New York, so did Spys, and Baldwins brought $7 or more. Perhaps we haven't the full secret of these top-notch prices and a little better, but we have one secret, namely that Mr. Jansen has shipped to the same commission house in New York for 20 years, and it takes all the fruit he can raise. The commission man knows precisely what he is getting when he reads the Jansen labels and so do the customers, the consumers, in the city. It is chiefly this that enables Mr. Jansen to get about $1 per barrel more than the market price for this choice fruit. The new packing and grading law doesn't trouble him in the least. He has been doing the very thing the law requires for years. He says the law is all right and will bring to account those men who have been accustomed to use a stove pipe in the middle of the barrel while packing. Those growers who favor cultivation of orchards will not find much here to support their theory. Here are hundreds of trees, set 17 years ago, through and between which no plow has been driven in 12 years. These trees are averaging seven barrels, some running as high as 11 barrels, to the tree. J. W. D.

The New York Apple Crop.

THE apple market so far has been decidedly slow. Warm weather early in October also has reacted on many Wayne growers. Ordinarily all cars can be shipped without icing, but from reports in some parts of the county there would have been a gain in using cooled cars. Some dealers report that they are unable to dispose of any stock at $1.75 per barrel. Under these conditions not all of them are anxious to buy for early delivery. A large number of growers are not disposed to move on the market at the present quotations, and are placing their fruit either in cold or common storage. It is thought by many that when the plethora of undersized, inferior fruit is taken care of there will be much more of a chance for the better grades of fruit. One grower stated that he knew of a deal for seven cars at $2.25 per barrel. He averred that it was quite likely the next few days would see him buying for future selling.

The Wayne County Cold Storage and Ice Company has been incorporated at Newark. The amount of the capital stock is $125,000, divided into 1,250 shares of $100 each. The Lyons Cold Storage Company has about completed its plant, which is of reinforced concrete and terra cotta tile. It is three stories high, without a basement. The first floor contains the office, receiving room and engine room, with a storage capacity of 12,000 barrels, packing room and two elevators on the same floor. On the second floor is a storage room with a capacity of 15,000 barrels and a packing room; the third floor is given over to storage entirely, holding 17,000 barrels and making a total capacity of 44,000 barrels for the plant. Some fruit is already coming in. The plant was built by the Voshall-Percy Company; the machinery was installed by the Frick Construction Company. Work was started on the plant about the middle of June. The total cost will be $70,000. The directors of the company are Charles Coffey, N. A. Mestler, E. W. Haum, S. B. Gavitt and C. W. Barrick.

The War and Commerce.

DURING the first 10 days of October New York sent to European ports 2,600,000 bushels of wheat, 500,000 of corn, 530,000 of oats, 10,000 tons of flour and 26,000 tons of raw sugar.

The Department of State has ruled that private citizens of the United States can sell army supplies to any of the warring nations of Europe without violation of neutrality. Of course such goods would be contraband and liable to seizure by an enemy on the sea. War expeditions fitted out in our ports or on land, are contrary to law.

A Pennsylvania concern has an order for 50,000 stretchers from Europe for removing wounded from the field, delivery to be made at the rate of 1,000 per week.

One peculiar result of the war is the failure of the Brazil Railway Co., which has been forced into receivership on complaint of stockholders. The Brazil Railway and subsidiary corporations is capitalized at $71,000,000, with debts said to exceed $118,000,000.

Great Britain embargo on wool shipments promises to make a slight increase in prices here, perhaps one cent per pound or more on specially desired varieties. Boston, the greatest wool market in this country, now has about 50,000,000 pounds in storage, on which $500,000 or more will be made by speculators. We produce about half the quantity of wool used here, and there will be practically no further supplies brought in until Spring, when the clip from Australia and other South Temperate Zone points will be on hand. The first lots may reach Boston in January. The outlook is for lower prices then, as Europe's manufacturing demand is so small. Sales of domestic wool at Boston are ranging from 19 to 26 cents. Some three-eighths blood Ohio has brought 28 cents; delaine unwashed, 22 to 24; and Montana, 19 to 22.

Woman and the Home

From Day to Day

COLUMBIA'S EMBLEM.

Blazon Columbia's emblem,
The bounteous golden corn!
Eons ago, of that great sun's glow
And the joy of the earth, 'twas born.
From Superior's shore to Chili,
From the ocean of dawn to the west,
With its banners of green and silken sheen
It sprang at the sun's behest;
And by dew and shower, from its natal hour,
With honey and wine 'twas fed,
Till on the slope and plain the gods were fain
To share the feast outspread;
For the rarest boon to the land they loved,
Was the corn so rich and fair,
Nor star nor breeze o'er the farthest seas
Could find its like elsewhere.

In their holiest temples the Incas
Offered the heaven-sent maize—
Grains wrought of gold, in a silver fold,
For the sun's enraptured gaze;
And its harvest came to the wandering tribes
As the gods' own gift and seal,
And Montezuma's festal bread
Was made of its sacred meal.
Narrow their cherished fields; but ours
Are broad as the continent's breast,
And, lavish as leaves, the rustling sheaves
Bring plenty and joy and rest:
For they strew the plains and crowd the wains
When the reapers meet at morn,
Till blithe cheers ring and west winds sing
A song for the garnered corn.

The rose may bloom for England,
The lily for France unfold;
Ireland may honor the shamrock,
Scotland her thistle hold;
But the shield of the great republic,
The glory of the west,
Shall bear a stalk of the tasseled corn—
The sun's supreme bequest!
The arbutus and the goldenrod
The heart of the north may cheer,
And the mountain laurel for Maryland
Its royal clusters rear,
And jasmine and magnolia
The crest of the south adorn;
But the wide republic's emblem
Is the bounteous, golden corn!

—Edna Dean Proctor.

*

THE London *Times* tells of one little French village in the path of war where an aged lady sent the town crier around with a drum, after the manner of rural France, to announce that she would take care of all cats and dogs left by their owners in their flight from the invaders, she remaining in the deserted village to care for the derelicts. We hope that this brave and humane woman was left unhurt, with her charges; she surely deserves one of Mr. Carnegie's medals.

*

HERE is a recipe for cranberry pudding, given by the *Mothers' Magazine*: Cream half a cupful of butter, add slowly one cupful of sugar, then add three well-beaten eggs. Mix three teaspoonfuls of baking powder with three and a half cupfuls of flour; add this to the mixture alternately with half a cupful of milk. Add two cupfuls of cranberries which have been washed, dried and floured with some of the flour already measured. Turn into a buttered mold, cover closely and steam two hours. Serve with hard sauce.

*

THE Department of Agriculture has issued a very interesting Farmers' Bulletin, No. 609, on "Bird Houses and How to Build Them." It is by Ned Dearborn, Assistant Biologist of the Bureau of Biological Survey. The introduction gives general advice and suggestions for attracting birds about a home or farm. The bulletin states that since the movement began to encourage bird protection the number of house birds has greatly increased. Dimensions are given for nesting boxes, adapted to different sorts of birds. Some of the martin boxes shown are regular apartment houses, with accommodations for a number of feathered families. The plans given range from the humble tomato can or empty gourd to structures of some elaboration. We think the bulletin will be greatly enjoyed by young people on the farm, who will have opportunity during the Winter to make plans for bird homes before the next nesting season. Reference is made to the attraction offered birds, during the Summer, by a shallow pool or pan of water for drinking and bathing. During the past Summer we found that a fountain made by the spray from a hose in a shady place, attracted birds in great quantity; they frolicked in it like a lot of boys in a swimming hole. Last Winter, which was very snowy with us, we fed starving birds by hundreds, and many of them stayed with us until the thaw came.

The Rural Patterns.

In ordering, send number and size of patterns desired. Price of each pattern, 10 cents.

7779, Ladies' plain blouse or shirt waist. Cut in sizes 34 to 44 bust measure. Size 38 requires 2 yards of 36-inch material. 7855, Shirt waist or blouse. Cut in sizes 34 to 44 bust measure. Size 38 requires 2⅝ yards of 36-inch material. 8176, Semi-princesse gown. Cut in

sizes 34 to 40 bust measure. Size 36 requires 4 yards of 36 or 44-inch material with 1⅜ yards 27 inches wide for trimming. 8407, Ladies' one-piece skirt with yoke. Cut in sizes 24 to 32 waist measure. Size 28 requires 2½ yards of 36 or 44-inch material. 7549, Four-piece skirt for women. Cut in sizes 22 to 32 waist measure. Size 26 requires 3½ yards of plain material 36 inches wide, or 4½ yards if material has figure or nap.

7885, Girl's one-piece dress. Cut in sizes 8, 10 and 12 years. Size 10 re-

quires 3¼ yards of 36-inch material with 1 yard 27 inches wide for collar, belt and cuffs. 7860, Girl's dress. Cut in sizes 10, 12 and 14 years. Size 12 requires 4½ yards of 36-inch material. 8361, Dress with long tunic, for misses and small women. Cut in sizes 16 and 18 years. Size 16 requires 6 yards of 36-inch material with 1½ yards for the facing and collar to make as shown on the figure. 8387, Child's apron. Cut in sizes 2, 4 and 6 years. Size 4 requires 1½ yards of 36 or 44-inch material. 8274a, Girl's dress. Cut in sizes 6, 8 and 10 years. Size 8 requires 2⅝ yards of 36-inch to make of one material.

Weaving Coverlets.

I AM very anxious to know how to weave the old-fashioned coverlets (blue and white). Can you give me any information about the work?

MRS. C. P. E.

Will some one who has preserved a knowledge of this old-time handicraft tell us all about it, from threading the warp to the finished product? We have had some references to it, but not quite specific enough to help a beginner, and even an old-fashioned hand loom seems very complicated to the inexperienced. A very good book for the amateur weaver is "Hand Loom Weaving, Plain and Ornamental," by Luther Hooper. It is an English work, and while it does not mention coverlets, it explains all the parts of a loom very thoroughly, the explanation being aided by many pictures. It shows some patterns that could be used for bed covers, telling just how they are made. These hand-woven coverlets are now chiefly made in the South, though they form one of the revived handicrafts in New England. Some handsome ones, made of home-dyed flax, the blue colored with indigo, are to be seen among old Dutch families in New Jersey.

Frugal but Savory.

GRAVY For a Meatless Dinner.—Cook one medium-sized onion (minced fine) in four cupfuls of boiling water. When onion is cooked until tender add two bouillon cubes. Thicken with butter and flour and add one teaspoonful of sage.

A Hearty Dish.—Boil two cupfuls of rice and six sliced sweet peppers until done. Salt to taste. When cold shape into croquettes, roll in flour and fry in plenty of lard. Serve with a tomato sauce made as follows: Stew one pint of cooked tomatoes and one onion for 15 minutes, then rub them through a wire sieve. Thicken the strained tomato with butter and flour.

F. A.

Tomato Pot Roast.—Beef of bottom of round, or any preferred cut for this dish, three to four pounds; hot drippings, two tablespoonfuls; onions, two medium sized; carrot, one; bayleaf, one-half; liquid portion of a can of tomatoes, or fresh tomatoes, four or five; salt and paprika to taste; thickening, sugar, one-quarter teaspoonful; flour, one tablespoonful, will be needed.

Sear the meat on all sides in the hot drippings, put in boiler and add the onions, sliced, also the carrot, sliced, and half of a bayleaf. Cover with the tomatoes. If fresh tomatoes are used they should be peeled and cut into small pieces. Add the salt and paprika, cover the pot tightly and let simmer slowly for three hours, or until done. A little water may be added if the tomato juice cooks down too much. When serving thicken the sauce, and add more sugar and more salt and pepper if necessary. Thicken with one tablespoonful of flour, moistened with cold water, to each cup of gravy; let boil and serve in a sauceboat.

As a plant upon the earth, so a man rests upon the bosom of God; he is nourished by falling fountains, and draws, at his need, inexhaustible power. Who can set bounds to the possibilities of man?—Emerson.

An Indoor Closet For Every Home

This sanitary convenience, this modern comfort, this safeguard to health, is now within *your* means.

We have perfected a simple and inexpensive chemical system in

THE WATERBURY SANITARY CLOSET
ALL METAL—CHEMICAL

that does away with the necessity for plumbing, water system and cesspool. Thus for the very small cost of $22.50 you can have a complete, sanitary, odorless indoor closet.

No installation cost; is quickly set up. You can put the Waterbury in any room, hallway or closet in the house, as it is positively inoffensive in every way. It is a well finished, nicely decorated piece of furniture. The odorless and sanitary features are covered by our guaranty.

You can feel perfectly safe in ordering direct from this ad. if you wish to get a Waterbury Sanitary Closet as soon as possible. A big, responsible, well known company is behind the Waterbury and the real guaranty that goes with it.

By all means write for the Waterbury Book, explaining fully how it works.

Don't Go Through Another Winter Without

Fresh Running Water in Your Country Home

Don't be bothered with frozen pumps and tanks again this year. Give your family the greatest of all conveniences and luxuries—running water fresh from the well, hard and soft, hot or cold for kitchen, laundry, toilet and bath. Spare them the usual winter discomfort and sickness due to exposure and cold. Give your stock all the pure water they want at well temperature the year 'round and see them thrive and make you bigger profits. Icy water stops digestion, cuts down the milk yield—keeps stock from putting on flesh.

Over 6 Years Old

Everfresh WATER SYSTEM

Over 6000 Sold

—requires no water storage tank and is controlled entirely by ordinary water faucets. Opening any faucet starts the Perry Pump working and delivers a full steady flow of water fresh from the well. Closing the faucet stops the pump and it will remain idle until a faucet is again opened. Simplest, safest, easiest water system to install and operate. Write for FREE catalog today.

UNITED PUMP & POWER CO., 473 Dickey Bldg., Chicago

Suggestions for a Hallowe'en Celebration.

OF the many celebrations that come to us throughout the year All Saints' Eve, or Hallowe'en, with its mystic traditions, offers the most real merriment for our fun-loving young people. The tang in the crisp Autumn air sets pulse beating high, and puts one in just the mood for a lark with weird spooks, sly elves and gruesome witches. Then, too, the fact that one is not expected to dress in his best or stand on ceremonies lends much to the zest of the occasion. The big farmhouse kitchen, a roomy old-fashioned cellar, or, if the weather is not too chillly, a clean swept barn, lighted with pumpkin Jack-o'-lanterns, make ideal places for frolicking, feasting, and ghost meets.

Invitations for a Hallowe'en party can be as quaint and fantastical as one wishes. A piece of coarse brown wrapping paper with ragged edges, waxed to resemble parchment, and decorated with one of the many old-time Hallowe'en devices—witches, black cats, bats, owls, or pumpkin heads, in red and black ink; rolled and tied with red and black ribbon, or sealed with red and black sealing wax, are very appropriate.

The woods, fields and garden will furnish enough suitable material for decorations. Squashes and pumpkins, cut into halves, crosswise or lengthwise, the seeds and pulp scooped out, make charming receptacles for gay Autumn leaves and red berries, and for holding fruit, nuts and bonbons. A great cabbage head with the heart removed, makes an ideal Jack Horner for the center of the table. All sorts of small fantastical gifts, wrapped in tissue paper and tied with half-inch ribbon in yellow and black, equal numbers of each color, leaving long streamers, are hidden among its leaves and in the center. After the feast is eaten each guest draws a prize by pulling on a ribbon.

Big red and yellow apples, with the blossom end sliced off so they will stand alone, the top cut evenly off, the core scooped out, and the cavities filled with red, yellow and brown candies, then the top replaced, with a tiny lighted candle set in where the stem once was, and placed at each plate, make very attractive favors. The candles used for Christmas tree decorations are about the right size.

For another unique centerpiece, a great yellow pumpkin shell filled with fruit, nuts, and bonbons, has a circle of these small lighted candles set in around the edge. With this there is a candle blowing contest before the contents can be enjoyed. Each member of the party blows out the candle assigned him; if he does not succeed in the first attempt, or blows out more than one, he must lose his share of the goodies, or pay a forfeit.

As for the walls, there is nothing prettier than the fluffy gray Clematis and red mountain ash, or gray bayberries, and red and yellow oak leaves. Long, well-shaped carrots with oval slits cut in the big end for eyes, a triangle for the nose and a bow shape for the mouth, and a tuft of the foliage left on, suspending here and there among the Clematis, are both quaint and decorative. When pumpkins are plentiful Jack-o'-lanterns might be the only illumination, and when these are not forthcoming there are the big and little paper ones that can be purchased at a small cost in almost any of the large towns.

Half a dozen rolls of crepe paper with Hallowe'en patterns, offers a limitless range in decorative possibilities in this direction. The designs can be cut out and pasted on cardboard. Witches flying on broomsticks, or stirring the caldron kettle, thin black cats with bushy tails, dismal owls perched on bare boughs, "Br'er Rabbits" peeping out of pumpkin heads, and uncanny bats, all of which when cut out, mounted, and rubbed with a little phosphorescent paint, are just the thing for decorating the walls and table of a dimly-lighted room. The smaller designs can be used on the invitations if one likes, instead of the pen and ink sketches.

An open fire plays an important part in many of the old-time Hallowe'en games, and when this is not to be had the kitchen range or furnace are very good substitutes. There should be some real candlesticks with lighted candles for the "Jump Over the Candle" game you all know so well. A small washtub half filled with water, and partly hidden with evergreen boughs and Autumn leaves, is needed for the "bobbing apple" contest. Apples with the initial of a girl cut on them, are dropped into the water, then each boy is invited to duck his head and bring out one with his teeth. The letter on the apple is, of course, the initial of his true sweetheart. At the far corner of the room have the lights turned out, and a ghostly shrouded figure doling out fortunes. These, like the invitations, should be written in red and black ink on parchment-like paper, and handed to each guest as he or she is requested to approach the awesome specter.

Eating a thimbleful of salt while walking down the cellar stairs backward with a lighted candle in one hand and a looking glass in the other to catch a glimpse of one's future husband is another old-time feature. Then there is the nut test on the hearth, the test of the three "luggies," and the tossing of the apple paring to see what initial letters it forms as it falls to the floor, and many other old-fashioned foretelling signs and symbols that never lose their quaint charm. A ghost dance, where everyone, shrouded in pillow cases and sheets, wearing black or yellow mask, is expected to take part, will furnish any amount of fun.

Nuts and apples with plenty of sweet cider are the regulation refreshments for an old-time Hallowe'en frolic, but if one likes to add a touch of modernism there may be a menu something like this:

Devilled oysters.
Brown bread and cheese sandwiches.
Devil's food (black chocolate cake).
Ghost cake (white mountain cake with white icing).
Tea. Sweet cider. Home-made Fudge.

ROSAMOND LAMPMAN.

Seen in New York Shops.

CORSAGE bunches of artificial flowers or fruit are again much worn, but this Fall they are pinned on the coat high up on the left side, near the shoulder. A great many little bunches of fruit, satin or velvet, are thus worn, as well as flowers that never saw their counterparts in any garden. The street corsage bunches are almost always of small flowers, but gigantic velvet roses, single or semi-double, are used to pin on a muff, or for evening wear. These big roses cost from $1.50 up, each; little knots of small flowers or fruit cost from about 35 cents up, according to quality and make. Some artificial flowers are always expensive; for example, we have never seen cheap nasturtiums. Roses and violets are the universal flowers, coming in every grade of quality.

Among new neckwear are high collars, coming down to a low V-shape in front, which have a ribbon an inch wide run through broad eyelets at the back. The ribbon is tied in front, thus holding up the back of the collar; the tie crosses the open space left by the flaring collar, the V remaining open below it. The ribbon ties were either black satin or Roman stripes. These collars, in white washing organdie, with ribbon included, were 50 cents.

Maline ruffs and feather boas are both again in vogue. The ostrich boas noted are not round, but flat, of closely curled feathers, and are broader at the middle than at the ends, which are finished with tassels or long ribbon loops. Pleated maline ruffs are sometimes short enough to fit snug around the neck, while others are long enough to reach the waist line; black and white are most becoming, but this Fall there are many of maline, as well as feathers, in various shades of brown. It should be remembered that a plump, short-necked woman should never wear a maline ruff or feather boa; it is sure to give her a pouter-pigeon effect.

Among women's smart shoes are many made with the overgaiter effect; they are made of black Russia calf or patent coltskin, with an overgaiter effect of fawn, gray or black cloth. They have high French heels and light welted soles. For harder service are very businesslike walking shoes of tan Russia calf with Cuban or low heels. Bronze kid slippers, in a variety of models, are much in vogue; some are high-heeled evening models, others walking pumps. The evening slippers are often beaded in bronze, while other styles show bronze or yellowed silver buckles. All call for stockings to match, for while many women have been wearing stockings of white or contrasting colors with pumps and slippers, the style has never been really in vogue except for informal Summer wear. It has the disadvantage, too, of being usually unbecoming, unless the feet and ankles are unusually trim and pretty.

The new blouses are of infinite variety. One inexpensive model, costing $2.95, is of crepe de chine, having sleeves, chemisette and flaring high collar of lace, while another crepe de chine model, costing $3.95, has a high collar at the back and in the front finely tucked frills coming down to a V at the waist. Sleeveless basques of black satin, with white satin collar and revers, cost $3.95; sleeveless basques of black velvet, with silk sashes, are $5. These are worn over long-sleeved guimpes of lace or crepe de chine. Black satin basques are also shown with black lace sleeves. There are a great many styles of black lace blouses, either all black, or made over white chiffon. These are quite serviceable, while dressy and becoming. Black lace seems more in vogue than for several years.

A new style of veil, in either octagon or filet mesh, has a wide border formed of velvet squares.

A pretty dress for a girl from eight to 12 years old has a loose overdress of dark blue serge, something like a very long-waisted Balkan blouse with a short circular peplum, so that it came half way to the knee. Collar, cuffs and chemisette were of white pique. This was worn over a plain skirt of blue and white check. This is a desirable style for combining two materials.

One of the new circular skirts in blue serge fitted smoothly over the hips, where it had three rows of black silk braid; below it flared out so as to ripple at the bottom, being about 3½ yards round. This dress had a waist in coatee effect, with a rounded swallow-tail back; it was trimmed with silk braid and cube-shaped braid buttons, and had a white silk collar.

Shirred Eggs With Tomatoes.—Butter shallow fireproof shirring dishes and spread with a layer of tomato pulp which has been previously cooked to a thick paste and seasoned. Sprinkle with buttered crumbs except in centre. There, make a slight depression in which to break an egg. Place in the oven until the egg is sufficiently cooked and the crumbs well browned. If these shallow dishes are not available, spread the tomato pulp on a rather thick slice of toast, removing a little of the crumb from the centre to leave the hollow for the egg. Arrange in a baking tin and bake until eggs are set.

Baked Tomatoes With Bacon.—Remove thin slice from top and bottom of large tomatoes. Divide in two thick slices. Place in baking tin and set in moderate oven. When the tomatoes are partially cooked, place on each half a crossing of two narrow strips of thin bacon. Increase heat so that bacon shall crisp nicely. The bacon fat will furnish sufficient seasoning. Serve on rounds of buttered toast.

SOOT
REMOVED from flues stoves and heaters
WITHOUT MOVING PIPES!
Don't take down the stove pipes—don't risk chimney fires—don't let soot in the flues spoil the draft.
A handful of this wonderful new powder, "SOOTFO," sprinkled on the fire, eliminates part of the soot by chemical action, and loosens the rest so that it drops like dust to the bottom of the flue and is easily drawn out.
Perfectly safe—non-explosive—a child can use it. Non-injurious to pipes. A little used once a month will give you a perfect draft all the year.
We guarantee "SOOTFO" to remove the soot when used as directed, or money refunded.
One year's supply (5 lbs.) prepaid, $1. Send for free circular.

FARM STOCK BREEDING.

PART II.

General Principles.

HEREDITY.—The modern idea of heredity does not believe in the inheritance of acquired characters. Of course, that will largely depend upon what we call acquired characters. Some of the characteristics of a species or class of animals have been acquired through long ages of natural selection and weeding out of the weaker ones, but the common usage of the word, "acquired" when applied to characters means those which are of a transitory nature much as the tricks of a dog, the hand-shaking of a horse and other achievements which may be brought on by training. The colt will not possess the acquired characters of the mother; that is, the colt of a trick mare will not necessarily be a trick colt although he may have acquired a tendency in that direction, and may be very easily trained to do tricks. I have seen colts of such mares very obstinate and scarcely able to learn anything. The feeding or other factors which enter into the making of the desirable adult besides the coming together of two desirable parents are acquired characters, and the answer to the question of their transmission is probably no.

PRENATAL INFLUENCES.—While we must not deny that the nervous condition of the mother may have some effect upon the offspring, such prodigious effects as are often claimed for it would seem to be simply "out of the question." Many freaks which are often called birth marks are more likely cases of reversion to some ancestor or cases of arrested development.

CROSSING BREEDS.—The crossing of breeds is a practise that is seldom advisable, for the chances are that one will get an inferior animal which combines the bad characters of both breeds and has not the good qualities of either of the animals entering into the cross. In some cases, however, as crossing the Shorthorn upon the Hereford gives a good type of market steer, the two breeds seem to reinforce each other. At any rate, never cross more than once. If crossing is done at all, it should be for the production of market stock only. Cross a Shorthorn bull on a Hereford cow and the first cross may not look like either of the parents but the offspring of such first crosses will look very much alike. Go on with the crossing on these halfbreeds with the Shorthorn bull and one gets everything ranging through good, bad and indifferent. After one gets beyond the first cross, the weak points of both breeds begin to show up and a mongrel lot of stock is the result. It is true that some of our breeds were originated by crossing on native cattle, but at present we have enough breeds to supply adequately the needs of any part of the country. Make a choice of the breed that best fills the requirements and then stick to it. Sometime ago, a correspondent of THE R. N.-Y. wrote that some dairymen in the Western Reserve in Ohio had been breeding up Holsteins for eight to 10 years and then to get the bonus for high-testing milk, Jersey bulls were turned in. This could hardly be considered good dairy breeding. If this is continued for 10 years, these farmers will have neither Holsteins, Jerseys nor a new breed but will be the owners of a mongrel lot of cattle.

TRANSMISSION OF DISEASE.—We often hear it claimed that diseases can be directly transmitted to the embryo. This is probably true in blood diseases or diseases of the ovaries. It seems that hog cholera which is a blood disease can be transmitted to the offspring. I have never known of a case where a sow contracted hog cholera and still farrowed her pigs naturally. She will invariably abort if she has true hog cholera. Another common disease which is transmitted in embryo is the white diarrhœa which affects young chicks from three to seven days after hatching and which is claimed by scientists to be due to diseased ovaries in the hens. These contaminate the embryo before the shell is formed around the egg and these bacteria grow with the developing chicks and are ready to attack them in dead earnest as soon as they emerge from the shell. The mother's blood gets to the embryo by diffusion or slow seeping through animal membranes; usually the bulk of it diffuses through cross membranes in the umbilicus or navel cord. The exact particulars vary with the different kinds of animals. Any blood-borne germ disease cannot be carried to the young as these membranes strain the germs out. In fact, the bacteriologist can separate the germs from blood or tissues by filtering through animal membranes. Of course, when the ovaries are diseased, it would be hard to imagine a healthy egg developing in them. The disease attacking the ovary would naturally attack the egg and either arrest its development or so weaken it that it would not develop into a healthy animal. Any local disease, however, such as in tuberculosis, lump-jaw, cancer, etc., does not seem to be transmitted to the offspring. There are on record many cases where tuberculous cows have dropped healthy calves. These have been isolated at once and not allowed to take the milk from their dams and have developed without ever having the disease. It seems that such offspring are somewhat super-sensitized to the attack of the disease from which the mother is suffering which means that they may inherit a tendency to be easy prey for the disease atlhough they do not actually inherit it. The best policy for the breeder is to avoid all these diseases so far as possible and thus preclude the possibility of spending time and money on animals having a tendency which renders them more susceptible. I. J. M.

Michigan.

LIVE STOCK NOTES.

THE butter production of Holland is so controlled by the government as to guarantee its purity. It amounts to 154,000,000 pounds yearly.

Increasing parasitical diseases in poultry and game birds in England is said to be due to distribution of dust in the air by automobiles.

French government agents sought contracts from New York steamship companies to transport 5,000 army horses to Bordeaux at $40 a head. The animals were westerners, half broken, light and young. They were suitable for cavalry work only, and cost from $80 to $100 per head. The large New York dealers say that most of the orders for horses have been put through dealers in the West, and that representatives of England and France are buying directly from ranchmen. One said that he knew of sales of more than 100,000 horses made in the West; that the animals were shipped either to England or France by way of Canada. This dealer said since the war commenced the price of horses went upward $20 to $25 per head, and they will go higher. He declared it is very difficult to secure large horses.

There is an organization of Texas ranchmen now established with the view to shipping to New York cattle and beef by water from the Black Prairie coast lands in the Lone Star State.

Don't try keeping over stunted pigs, hoping to get them growing this Winter, and perhaps ready for Spring. It is a waste of effort and feed, and besides it does not pay to let them become stunted, it will be a good plan to sell those little fellows now, before Winter starts in. Perhaps some neighbor with more feed can make good use of them.

The advantages of raising Fall calves are that cream may be sold in Winter and skim-milk fed to calves, the calves may receive more careful attention; the calf is ready to go on pasture in Spring. Keep the calves in a dry place, give them plenty of sunlight and air, keep the calves growing steadily, and free from lice.

Many farm people in the Winter will allow the separator to stand several days without washing, only flushing it out with warm water. The California Station advises: "The cleanliness of the separator needs first attention. It must be kept scrupulously clean. The disastrous effects of using a foul separator bowl can be imagined only when recalling that all cream that passes through it becomes seeded with the bacteria it contains."

Preceding June 30th the imports of cheese from Europe averaged about five and one third million pounds a month for the year. Since then the European war has affected the imports considerably, and it is the opinion of the Department of Agriculture that American cheesemakers can take advantage of the opportunity to establish their products in place of European goods. Limburger has been made in America and sold for some years at a price which drove the imported product from the market, yet many people believe they are eating imported limburger.

SANITATION

would have saved a great many of the 7,420,912 hogs valued at $59,455,700.00 lost in United States during 1913 from

HOG CHOLERA

You can make your hog pens sanitary if you use

AMERICAN STEEL FENCE POST

Made by American Steel & Wire Company

High-class steel, heavily coated with zinc. Strong enough to hold up any wire fence and furnish all necessary resistance. End and corner posts so strong that they will maintain any wire fence made.

Cheaper than Wood and More Durable

Adapted to all conditions and absolutely satisfactory, no matter how heavy the fence nor how hard the usage after the fence is erected. Give better service than wood post, and you get the benefit of every post in the fence from year to year, while wood posts burn, rot and decay from the start. Have been in service since 1893, in every section of the United States, and the oldest posts now as good as when set. Adapted to all fences. Increases the life of a fence. A wire fence on wooden posts is like building a brick house on a wood foundation. For sale by dealers everywhere. Big picture catalog FREE.

THE RURAL NEW-YORKER,
333 WEST 30th ST., NEW YORK.

SUCCESS WITH PUREBREDS.

I BEGAN farming February 1, 1912, with five head of purebreds and 20 grades. In August of that year I purchased Fairview Pontiac Korndyke Prince, who possesses 75% of the same blood as Pontiac Korndyke, and am using him as my herd sire. I now have 21 purebreds and have six A. R. O. records. One cow over 17 years of age, 43 days after calving, made 377.8 pounds milk and 16 pounds butter in seven days. One of her three daughters as a junior two-year-old produced 344.7 pounds milk and 17.71 pounds of butter in seven days. Other two-year-olds have produced 18.81 and 17.66 pounds butter in seven days, receiving ordinar care. My rations for milch cows are 200 pounds brewers' grains, 100 pounds bran, 75 pounds ground oats, 100 pounds gluten, 75 pounds oil meal, 100 pounds ground Alfalfa and four pounds salt. I feed cottonseed meal, but do not mix it with the other grains. For dry cows and calves, I mix 50 pounds ground oats, 100 pounds bran, 100 hominy, and 100 pounds oil meal. To prepare cows for testing add three to five quarts of oil meal as required. For young calves I begin with three pounds milk and one pound water, gradually adding milk until six pounds is reached, and feed them all the grain they will eat up clean. M. N. TOREY.
Delaware Co., N. Y.

Selecting Steers for "Feeder" Cattle.

IN selecting steers that will feed to a profit, the Wisconsin station advises:

They must have beef characteristics, a wide strong back and a large heart girth.

They must have strong frame with plenty of room for vital organs, for a weak constitutioned animal cannot endure the feeding season.

A wide head and muzzle usually indicates good feeding qualities.

Short legs, heavy hind quarters and arched ribs are essential in the feeding animal.

The skin should be reasonably thick, soft, and covered by heavy coat of hair.

The animal should have a straight back and low-set appearance due to the depth of body and short legs.

Things a Dairyman Should Not Do.

THE following advice placarded in view of dairymen visitors at Syracuse, should be brought home to every farmer:

Do not stir up any dust just before milking time.
Do not sweep the stables at milking time.
Do not milk with dirty hands.
Do not use a wide-top pail.
Do not allow milk to stand in the stable.
Things a dairyman should do:
Keep cows clean.
Wipe flanks and udders just before milking.
Avoid dust in the stable at milking time.
Have clean hands and clothing while milking and handling milk.
Thoroughly cleanse and scald all utensils and keep in clean place.
Use a small-top milk pail.

FARM NEWS.

AT the Ninth Annual Dairy Show, October 22-31, 1914, the American Jersey Cattle Club has offered $1,000 in premiums. 181 Jerseys have been entered in competition for these premiums. A mass meeting of Jersey breeders will be held, either in the Breeders' Building or at the Saddle and Sirloin Club, at the Stock Yards, at 2.30 P. M., October 29. A meeting of the Board of Directors of the Club will be held on October 29th, at 10 A. M., at the Hotel Blackstone; and a Banquet of Jersey breeders, under the auspices of the A. J. C. C., will take place at the Hotel Blackstone on the evening of October 28th, at 7.30 P. M. All Jersey breeders are cordially invited.

The European war, together with the increased demand for purebred draft stallions from American stables, should establish the American breeder on a very firm basis. The importations will suffer severe curtailment as the war progresses, although when the war commenced, those animals that were already purchased were not requisitioned, and yet there was considerable difficulty in getting from foreign ports here. In speaking of American Percherons a prominent live stock writer declared he had seen as good Percherons in America as he had seen in France.

Three buyers recently from Graham County, Arizona, visited Wisconsin, and from three counties took out 250 purebred Holstein, Guernsey and Jersey cattle, paying an average price of $100 a head.

Holsteins For Sale—100 high-grade yearlings, $40 and $45 each. Heifer calves, 7/8 Holstein, $15 each. Registered Holstein bulls, $35 to $100 each. REAGAN BROS., Tully, N.Y.

ONTARIO PRINCE LORIE—HOLSTEIN BULL—born, April 3, 1914; dam, high record granddaughter of Hengerveld De Kol; sire, 35.61 pound bull. Price, $250. Send for pedigree. Cloverdale Farm, Charlotte, N. Y.

Registered Holstein Bull Calf—born Sept. 1914. Dam has an official record at three years old of 17 lbs. of butter. Price, $50. One ready for service at $125.
ARTHUR R. FREEMAN, PULASKI, N. Y.

Holstein Bull
Yearling grandson of Pontiac Korndyke. Sire's dam has record of 33 lbs. butter 7 days. More white than black. A bargain. Sabarama Farm, Baldwinsville, N Y.

READY FOR SERVICE—PRICES, $75 00 to $150.00 Registered Holstein and Jersey Bulls. Splendid individuals with great backing. Best blood in the land. Also younger bull calves. Write for list. HOMEWOOD FARMS, RYE, N. Y.

Fine Purebred Holstein Bull Calves
FOR SALE—We have two at $45 each, suitable to bring up a grade herd. Others of fancier breeding, $125 to $300 each. Suitable to head any herd.
MOHEGAN FARM, Mohegan Lake, N. Y.
Hudson Valley Holstein Headquarters

REGISTERED HOLSTEIN YEARLING BULLS
Sired by Colonel Korndyke De Kol, one of the best sons of Pontiac Korndyke. Also 4 grandsons of the King of the Butter Kings, from choice heavy-milking dams, at popular prices. Write me what you want. Donald F. McLennan, Syracuse, New York

East River Grade Holsteins For Sale
75 High Grade Cows just fresh, large producers. 40 cows due to calve this month and next. 40 extra nice heifer calves ten days old, sired by pure blooded bulls, from high producing dams. Registered and grade bulls all ages.
WE TUBERCULINE TEST.
JOHN B. WEBSTER,
Dept. Y, Cortland, N. Y. *Bell Phone 14, F. 5.*

SPRINGDALE FARMS
Is the best place to buy
GRADE HOLSTEINS
200 Cows and Heifers always on hand. Largest, finest individuals, heaviest milkers.
Registered bulls, Pontiac & Colantha breeding.
F. P. SAUNDERS & SON, Cortland, N. Y.
Office, 50 Clinton Ave.

Purebred Registered
HOLSTEIN CATTLE
With thirty common cows, each giving 3,000 pounds of milk per year, introduce a purebred registered Holstein bull. In two years, you'll be milking grade Holsteins yielding 4,000 to 5,000 pounds. In five years, you'll have 6,000 pound cows and will need to keep only fifteen cows to get the same amount of milk. In ten years, you'll have 8,000 to 9,000 pound cows and a ten-cow herd will produce as much milk as your thirty cows do now.
Quite a saving in labor, feed, and equipment to say nothing of the increased value of your cows and calves.

THE SILO.

Paints for the Silo.

I READ the cob-house silo article on page 1071 with interest. I have a square silo built of rough boards not surfaced, some boards thicker than others, some shrunk, but practically airtight, except possibly in the corners. I am looking for a preparation to finish inside of same to make it absolutely airtight, fill cracks and make a smooth surface. Do you think gas tar will do this? If so how much time does it take for it to set? Several years ago before I was interested in silos I saw a barrel of something which looked like some kind of tar and rosin that was applied hot to the inside of silos and finished them up nicely. I cannot find anything like this on the market, and am hoping that you can direct me. If I use gas tar do you think sand and cement could be used with it in place of sawdust as a crack filler, as advised in the article? R. E. P.

Nelson, Pa.

From the description given, there does not seem to be any serious difficulties to overcome, as the silo seems about "tight" to commence with. I think any of the waterproof paints would fill all cracks and make a smooth surface, the value of the latter is to prevent friction, or preventing perfect settling of the silage along the walls, and the rough, uneven surface might hold a little air if the silo was boarded horizontally. There are three paints, that I think would—any of them—fill the bill. One very cheap and simple one is skim-milk and Portland cement made somewhat thick and put on liberally with a wide brush; it would fill all cracks, make a smooth surface, dries quickly and would, I am sure, make the corners snug. The other is gas tar, mixed with gasoline to medium thickness and applied with a liberally filled brush, commencing at the top to paint. This is a great crack filler, quickly dries out, never peels or loses its hard shiny surface, as my old silo painted with it quite 25 years ago, will testify. If the corners are too wide open, paint them liberally, then run up a narrow width of roofing paper in the corner, and nail in a three-cornered strip, and then put on more paint. You then will have an air and moisture-proof lining to the silo. Of the composition of supposed tar and rosin you mention I have no knowledge, though it may be what is known as smokestack paint, and used also for coating tar-paper roofs, is cheap, dries quickly, and is a good filler. For large cracks the tar and sawdust is all right, but its use, as referred to, was a "cement" to be used between the layers of planks where the silo walls are made by spiking planks, one upon the other; some are still building that way, though very costly in lumber.

JOHN GOULD.

Who Should Build Silos?

IT is hard to estimate the value of the silo for the farmer on the corn belt farm who keeps any amount of live stock. Silage has long been proven and recognized as one of the best feeds obtainable for either Winter or Summer feeding. Some different crops may be advantageously siloed, but the most commonly used, and perhaps one of the most satisfactory is Indian corn. Corn silage is by far the most generally used, but clover, Alfalfa, rye and oats have been siloed by many with good results.

Silage is used for feeding beef and dairy cattle to a larger extent perhaps than any other live stock. Some feed it with good advantage to breeding sows, and say it invigorates and tones up the sow's system, and keeps the bowels gently loose, which is so essential before farrowing time. Others insist that it is not a highly satisfactory feed for hogs because too much fiber is necessarily eaten, which is hard to digest and of no particular value. Other farmers feed it to horses in limited quantities with the best of results. However, the horse's digestive apparatus is so different from that of the cow that if the greatest care is not exercised in feeding, serious cases of indigestion may arise. The writer has fed silage in a very limited way to swine and horses, but has fed large quantities of it to cattle and sheep, and likes it for this purpose. From the fact that silage has been found such valuable feed for farm live stock, and since by siloing corn there is practically no waste of the corn plant, because the whole stalk is put into the silo from right above the ground, including the ear, the purchasing of a silo is worthy of serious deliberation for many farmers, but after all, is the silo a necessary asset for the average farmer in the corn belt? Several things must be taken into consideration before buying a silo. Many have the erroneous idea that because the silo is a good investment for the average man who keeps a number of cattle or other live stock, it is desirable for the one keeping a limited number of live stock. Where only four or five cows, three or four horses, no sheep, and hogs not to exceed 30 are kept, and it is expected to add no more, a silo is not a good investment.

The writer resides in one of the chief tobacco-growing regions of Ohio, but a large amount of live stock is kept by a great many farmers who have silos. The farmer who devotes most of his time and energies to tobacco or some other crop does not need a silo. Many farms are less than 100 acres, and tobacco is the main money crop, with only sufficient live stock to supply the wants of the home with beef, butter and milk; with a portion of the products to sell. For men thus situated silos are not necessary, but to get the most out of this process the cattle need be fed a balanced ration out of a combination of clover, or Alfalfa, chop feed, oil or cottonseed meal. The horses can be fed clover or Timothy hay, corn stover, corn and oats, or a combination of these.

The farmer who is so situated that it is a difficult task to get sufficient help at filling time may find that the silo is not desirable for him. Here with us in the tobacco region silo filling, tobacco cutting and wheat sowing all come at practically the same time, and for this reason we have had to delay filling the silo several days on different occasions until we could get sufficient help. The corn was more matured than we would have liked to have it by this delay. If the hired help problem is a serious one, the silo may be an unnecessary equipment, but for the farmer who has none of these undesirable conditions to meet and who retains sufficient live stock cannot make a better investment than to erect one of standard makes of silos, and thereby conserve the corn crop and get the most possible benefit from the entire crop.

Miami Co., Ohio.

Fumes from Silo Kill Four.

COLUMBUS, O., Sept. 23.—Four men were killed at the hospital farm Saturday, according to a telegram sent by officials of the Athens State hospital to members of the State board of administration, the governing body. Two other persons were reported probably fatally injured. The men were overcome by noxious fumes generated in the silo. All the victims were patients in the State hospital.

This report is printed in the daily papers. Every year we have several reports of this sort. The "deadly fumes" come from carbonic acid gas. This is heavier than air, and settles at the bottom of silos, wells or cellars, or in large valleys where there is no chance for air drainage. In nearly every neighborhood there are records of death from going down into old wells which have not been used for some months. No one should go into a silo or a well testing the air. Lower down a lantern or a candle before entering. If the light goes out do not go down until the air has been well stirred up. By working the cutter or blower into the silo for a few moments the danger will be removed. A chain and bucket pump in the well or a flat board or pan churned up and down at the end of a stick or rope will mix the air thoroughly. The average silo with the feeding gates left open is not likely to be dangerous as the heavy gas can drain out.

SILO PARTLY UNDERGROUND.—I expect to put up a silo right in the corner of the haymow in the barn. I wish to make it part underground, with a wooden silo on top. I have the room in the barn, and that is warm and handy always. If I can dig it I expect to go down about 15 feet, and eight feet wide. If I concrete the hole six or eight inches all around I think I shall have a substantial underground silo. They talk about the danger of suffocating in such a pit, but I think there is a way of overcoming that. I intend to remain about 12 or 15 inches away from the wall so as to work around my top silo. I intend to salt the silage. Does that help to keep it in good shape? If any of your readers have any experience with such work I wish they would let me know.

THE EGG-LAYING CONTEST.

THE forty-ninth week shows an egg production of 1,417 eggs; this is 250 eggs less than last week. All of the American breeds, Rocks, Wyandottes, R. I. Reds, show a much better egg production than the White Leghorns, with the exception of the high-scoring pens of the latter breed, which are holding up remarkably well. A singular fact is that this week all the three highest pens of White Leghorns lay the same number of eggs. Tom Barron's pen laid 28, Francis F. Lincoln's pen laid 28, and Storrs Agricultural Station pen No. 42—the "sour milk" pen—laid 28. These were the three highest scoring pens among the Leghorns. But the "top-notcher" for the week is Tom Barron's White Wyandottes, with a score of 41. When Mr. Barron was on here last July, and his Wyandottes had fallen to second place, he said to me that he still thought they had a good chance to win, because "they would beat the Leghorns at laying when the cold weather comes." But Francis F. Lincoln's Leghorns are 25 eggs ahead, and there are only three weeks to go, so it looks doubtful; yet if the Wyandottes can gain for two weeks as many as they have this week, viz.: 13 eggs, they will beat Lincoln's birds by one egg. It's a very pretty fight as it stands. What impresses me very much is Mr. Barron's confidence in the results of his breeding; in private conversation, he would say "those birds are bred right, and they will do"—so and so. It seemed as if in his mind it was like a mathematical demonstration; that there was very little of the element of chance in it.

I have just received the report for September of the Missouri contest. The English Leghorns have laid 2,136 eggs in the 10 months; the next highest pen is a pen of Leghorns from Missouri, and their total is 1,909, showing a lead of 227 eggs for the Barron pen.

The Storrs contest bids fair to have 100 pens full in the next contest; more breeds are represented than ever before. So far no one has entered any Light Brahmas. Hasn't some breeder of this grand old breed the "sand" to enter a pen? The report for the week is as follows:

GEO. A. COSGROVE.

Fowls on Free Range.

I AM about to start a small chicken ranch of about 100 hens. I have no pens. Do you think if I keep about 12 cockerels and let a different one run each day to prevent their fighting, this would be sufficient to insure good fertile eggs? I think breeding fowls will do better and keep in a healthier condition if let run at large. Do you not think so? R. S.

Three vigorous cockerels should be ample in a flock of 100 Leghorn hens, and if they have free range it is not necessary to keep part of them shut up to prevent fighting. It is true that breeding fowls do better when having their liberty, but in cold weather it is necessary for them to have comfortable quarters of some kind; these quarters may be very inexpensive, however, if dry and free from drafts. M. B. D.

Lettuce and Feathers.

IS there an element in lettuce leaves, which will promote the growth of feathers, on chickens, which are slow to feather out? I ask because in a 10-chicken hatch kept in a coop of Plymouth Rocks, two did not feather out; they were covered with a down until quite large, five or six weeks old. I then fed the brood lettuce, and a few days after I commenced doing so I noticed that feathers came out rapidly and they were soon covered, while the others in the brood seemed to grow brighter and more feathers. M. H. D.

I know of no reason for thinking that lettuce leaves can stimulate the growth of feathers, these latter requiring for their development the protein element of food in which most vegetables are deficient. The observation is interesting, however, and may well be followed up if occasion offers. Most flocks show, at times, cases of delayed development in feathering out, this seeming to be rather a curious physiological phenomenon not easily accounted for. A friend in Alabama gives the following interesting account of delayed feathering as seen in the South. "I have had Barred Rocks, chicks hatched in early Spring or late Fall, go along and feather normally but those hatched in late Spring and early Summer shed the baby down and the pullets grow a normal covering, while the little cockerels go as naked as a plantation pickaninny, except for a few of the flight wing feathers and some on the head and back of the neck. They often get badly sunburned on the back because of the lack of protection. The young roosters always feather up all right as the cooler nights begin, and it has appeared to me that, as a rule, the featherless specimens feather up and are better birds. This happens as regularly here as the year rolls around to the appointed season." M. B. D.

Cleaning Soiled Eggs.

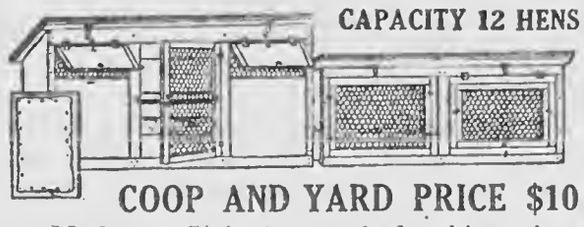
WHAT can be used to remove spots from eggs? I generally keep from 500 to 800 hens and at times some of the eggs get very dirty and I find it impossible to remove the stains.
New York. W. B.

I know of nothing more suitable for this purpose than one of the scouring materials used upon a soft dampened rag. Most stains may be quickly scoured off with one of these scouring soaps and the shell is left in as good condition as is possible after washing. Poultrymen are frequently cautioned against washing eggs in preparation for market, as this removes the protective coating from the newly laid shell and injures the keeping quality of the egg. While all this is undoubtedly true, all poultrymen know that it is practically impossible to keep eggs from becoming soiled in the nests, and if they were sent to market without cleaning they would be severely cut in price. Until some method of preventing hens from soiling their eggs is devised eggs will be washed, and the use of these scouring materials removes the stains with as little injury to the egg as anything known to the writer. M. B. D.

Middlings and Mixed Feed.

ARE brown middlings, and same marked standard middlings, as good as mixed feed for poultry and horses? They usually sell for $2 per ton less here than mixed feed. G. W. S.
So. Woodstock, Vt.

There seems to be no definite standard for middlings or trade name by which the grade can be recognized; millers market their wheat middlings under different names and these signify little or nothing as to the quality of the product. Mixed wheat feed, composed of both middlings and bran, is superior to ordinary middlings, whether marked "Brown" or "Standard" and should bring more in the market. M. B. D.



CAPACITY 12 HENS

COOP AND YARD PRICE $10

Made of 7/8-inch matched white pine lumber, planed two sides. Weight of outfit 300 pounds. Shipped k. d.

PUBLISHER'S DESK

WHAT do you think of the Franklin Park Corporation, circulars of which I enclose? It does not appeal to me but I would be glad to have your estimate of it. A. G. F.
Virginia.

The literature accompanying this inquiry seems to indicate that the Franklin Park Corporation is located at Washington, D. C., and that they want to organize a branch office in Virginia. They want a manager for the local Park Corporation who will invest from $4,000 to $7,000 in the business, and they say appropriation of half the investment will be made for his salary and expenses. They claim the opportunity is presented for making $4,000 to $10,000 per annum. The inducement for the manager to put up cash in advance, and the fixing of his salary is significant, though there is nothing very new about it. We have seen a good many schemes in the past started on just this basis, but if a man wants to pay himself a salary of $2,000 out of his own pocket, we see no very good reason why he should put up $4,000 to somebody else for the privilege. Our opinion is that he can make better use of his money.

I think I am eligible to membership in the Anti-Fake Club, as I have already turned down several papers on account of their advs. and have reported several cases of faking that have come to my notice. At a local fair recently there were numerous glib-tongued agents who wanted to send papers free of charge for one year to introduce the paper. All they asked was that you pay the postage, which probably amounted to their regular subscription. I examined the wares of two of these agents and showed them advs. that "queered" the paper for me. One fellow was a bit angry and wanted to know what influence I would have. He said it would amount to about as much as the Prohibitionists. He didn't seem to realize that if every one did his duty it would not take long to right any wrong. But where most everyone figures that his influence does not amount to much and he may as well take the course of least resistance the wrong is sure to prevail. One drop of water in a place does not amount to much but when enough of them get together and move in the same direction, their power is practically unlimited. L. E. G.
Vermont.

The above letter we think good enough to print in full. If we all did our part to produce conditions as we would like to have them, there would be no doubt of the result. And what a beautiful world we would have to live in. The gathering members of this Anti-Fake Club seem determined to do their part all right.

We are enclosing bill against the Southern Express Company for one case of eggs shipped to a New York house on Sept. 26, 1912. The case of eggs was so badly damaged it was refused. We made claim against the express company, and received several letters from them. One letter in reply said the claim would be adjusted soon. The next letter stated they had lost the papers. We had given it up for lost, but seeing the work you are doing for others, we thought we would get you to try it.
Virginia. W. W.

We took this up promptly. On September 26, 1914, we received advice that this claim was settled on that day—just two years from date of shipment. If this claim had not been entered promptly we would not have been able to help in the adjustment, as the transportation companies are holding very strictly to the four-months limitation, and it will be well for shippers to bear this in mind.

I enclose a letter from the Victor Razor Co., 412 Drexel Bank Bldg., Chicago. A year or so ago I received a razor from them, which I returned, but they sent me another, or it may have been the same one, and I returned that. Now I have the package that they refer to in their letter. I have not opened it, but I suppose it contains a razor. If I thought they would not bother me or anyone else with it, I would accommodate them once more. I do not want the razor. Will you kindly advise me what I should do with the razor?
New Jersey. W. W.

The New Jersey subscriber is under no obligation whatever to return this razor. The Victor Razor Co., as is their habit, sent the subscriber the razor without his knowledge or consent, and it is incumbent upon them either to come and get it, if they want it back, or send postage for its return. The only way to stop this nefarious manner of doing business is to make it unprofitable. Some of our subscribers who have received razors in this way have sent them back by express, charges collect. If all who are sent razors or other goods in this way would take some such action and refuse being bluffed into paying for the goods under the threat of bringing legal action, this class of houses would soon go out of business or reform their methods. In his palmy days, E. G. Lewis organized an agency to collect just such claims on behalf of his fake advertisers. When Secretary Redfield, now of the Department of Labor, Washington, D. C., had the job of whitewashing Lewis through a Congressional committee he thought Lewis was doing a meritorious service to these victims of what were called systematic robberies. The robbers in their estimation were the people who refused to pay for razors and other worthless junk.

Do you consider Phelps building certificates a safe investment of the Farm and Home Publishing Company?
Pennsylvania. W. M. T.

Some years back Herbert Myrick, the controlling spirit in the above concern, put up a building in Springfield, Mass., for his publishing business. At the same time he advertised and sold so-called building certificates to subscribers of his various papers through the country, and promised 15 per cent. interest on them annually; but it was stipulated that the creditor must pay for one of the Myrick papers out of the interest. The certificate seemed to read plainly enough on the face of it that the balance would remain at compound interest and the whole might be withdrawn under certain conditions. Later when an effort was made by a creditor to withdraw the money, Mr. Myrick set up the claim that he was not entitled to the extra interest above the price of the paper, if he withdrew the money during his lifetime. That is you had to die to get it, and a veiled paragraph on the back of the certificate seemed capable of such an interpretation, though it is doubtful if any one would discover it on casual reading. On withdrawal the creditor was obliged to pay for two years in advance for the Myrick paper.

Mr. Myrick's different papers at the time were published by five or more separate companies. We have nothing to show that any of them owned the building at the time, and certainly four of the companies owned no part of it. Yet Mr. Myrick issued building certificates in the name of the companies having no interest in the building, and plainly represented to the purchasers that the certificate made them part owners in the building. It of course did nothing of the kind. Two of the papers which offered the certificates have since been sold. The papers have been discontinued to the certificate holders, and in some cases they have appealed to us, and we have collected the money for them. If any have lost their certificates or neglect going past the present publishers back to Mr. Myrick with a demand for the money, they have not been disturbed in their modest retirement. The certificates were nothing but receipts for the money, with some confusing details as to its return and the disposition of the interest. They were a mere evidence of indebtedness of the concern that signed them. These concerns had no interest in the Myrick building or any other building and of course no control of it. Some of the investors write that they thought the building was security for the investment. These were deceived.

The blank application with this inquiry indicates that Mr. Myrick simply wishes to borrow money from farmers at five per cent. interest payable semi-annually, and the principal returnable on 90 days notice after the lapse of a stated number of years. We do not care to draw any conclusion as to the safety of such an investment. We give the record and leave every man to draw his own conclusion. J. J. D.

UNCLE ZACK, the stable man, enjoyed local repute as a weather prophet. Miss Cassie, coming down early one morning, found Zack on the back porch. "Is the rain going to last all day, Zack?" she asked. "Yessum, Ah reckin it is." "Why, Zack," Miss Cassie said, "I have always heard you say, 'Rain before seven, clear before eleven.' Isn't that true?" "Yessum, it's strickly true," Uncle Zack maintained stoutly, "jes 'cepting it doan' apply to an *all-day rain, ma'am.*"—New York Evening Post.

Save $1 to $2.50 PER TON on Lime

Ground limestone at the quarry costs from $1 to $1.50 per ton. Freight and hauling makes it cost from $1.50 to $3 delivered on your farm. If you have lime rock available, it's like throwing away money to buy limestone at these prices! For, with a JEFFREY LIME-PULVER on your farm, after quarrying the rock, you can grind it for 50c per ton. You can save from $1 to $2.50 per ton. In a short time the machine has paid for itself. Your farm is free from rock—richer—more productive. You can grow the clover and alfalfa that before refused to thrive. You have lime in a form that's better than burnt lime.

Grinds 2 to 3 Tons Per Hour

The Jeffrey Lime-Pulver will take the big rocks—any size up to 4 inches thick and 11 inches long—and grind them to a powder at the rate of from 2 to 3 tons per hour. It's both a crusher and a pulverizer. No need to have two machines—one to crush and one to pulverize. The Lime-Pulver takes the big rocks and grinds them to a fineness that will go through your spreader without the slightest trouble—no clinkers to get in and break it up. You can grind the rock coarser if you desire. But fine grinding is of utmost importance.

Grinds Rock for Road Work, Corn Tobacco Stems, Bone, Etc.

The Lime-Pulver is a dual purpose machine. It will grind rock for road work—2 to 3 tons per hour. Grinds corn on the cob, tobacco stems and bone. Made in the famous Jeffrey shops, of materials almost wear-proof. Ball-bearing pulverizer—pulverizing hammers of Manganese steel. Mounted on wheels and as easily moved as a wagon. Sold on a money-back guarantee. If you have lime rock available and do not own a Lime-Pulver, you pay for it over and over again without ever really owning one, if you have lime rock, you can make big profits selling ground limestone to neighbors. Write today for full particulars, price and our free booklet on Lime.

Products, Prices and Trade.

Wholesale Prices at New York.

Week Ending Oct. 16, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with October is as follows. This is per 100 pounds in the 26-cent zone. This is what is known as the "maximum" for milk testing 3.8 to 4.2 per cent. fat, and is 20 cents per 100 pounds above the "flat" rate.

	1914.
October	$2.00
November	2.10
December	2.10
January	2.05
February	1.95
March	1.90

Wholesale prices paid by New York dealers are running $1.91 and $1.71 for B and C. Hotels and restaurants using two to three cans per day are paying five to six cents per quart, single quart prices from bakeries and grocery stores, six to seven cents; delivered milk, nine to 10 cents.

BUTTER.

The scarcity of best creamery has forced the price up one cent. Other grades are plentiful—some in surplus and meeting dull trade. Very little storage is moving, desirable lots being held firmly.

Creamery, extra, above 93 score, lb	32	@	32½

C. S. LORENTZEN,
Notary Public,
New York County.

My commission expires March 30, 1915.

EGGS.

The price range covering different qualities is unusually wide. Some nearby white have sold up to 50 cents, but lower grades are in considerable surplus, some permitted sale by the health authorities going as low as 10 cents. Most business in what are known as fresh gathered is under 30 cents, and best hennery brown, 32 to 34. There has been a little export business in good storage grades to England, and this trade may increase if breakage is not too heavy. On the other hand we have had small shipments from Denmark.

Storage, best	22	@	23
Lower grades	18	@	20

FRESH FRUITS.

Most apples are 25 to 50 cents per barrel less than last week, receipts having been heavy on our already loaded markets. Demand for pears has been good, and the better grades of Clairgeau and Bosc higher. Grapes in larger supply but selling well at former prices.

NUTS.

The market on chestnuts went to pieces badly owing to heavy supply and warm weather. In one day there was a drop of $4 per bushel on wild chestnuts. Cultivated have held up better in price. Some extra fine cultivated are seen—about half the size of Paragon, but closely resembling wild. In fact many would pass for wild nuts grown under favorable conditions. There is more commercial possibility in these moderate sizes at present than the very large ones. Hickory nuts are scarce, choice bringing upwards of $3 per bushel.

Our total circulation of currency is now $3,694,748,196, or $37.15 per capita.

*

The sale of gold bars at the New York Assay Office for the nine months ending September 30 amounted to $48,409,695.

*

The first steamer from New Zealand to New York without a stop arrived after a voyage of 44½ days by way of Cape Horn.

*

During September new incorporations amounting to $100,000 or over totalled $87,551,400. For the nine months of 1914 capitalization was $1,114,107,700. Delaware led in number of charters.

*

Since May the government fisheries commission has planted 182,000,000 lobster fry along the Maine coast. The young lobsters are the prey of many fishes, so that not more than 10 or 15 per cent. of the plant survives.

*

Brooklyn, N. Y., has been added to the postoffices where extensive distribution of farm produce by parcel post will be made. Postmaster W. E. Kelly will make lists of farmers who want to sell their goods in this way, and these names will be sent to Brooklyn residents. Distribution will be made from a special parcel post sub-station, so that the goods can be handled with the least possible delay. A similar experiment in Boston, Mass., has proven a great success.

*

The North Pacific Fruit Distributors have set these prices at primary shipping points for boxed apples, the first price being for "Extra" and the second "Fancy." Baldwin, $105 @ 85; Jonathan, $1.15 @ 95; McIntosh $1.05 @ 85; Rome Beauty, $1.25 @ $1.05; Spitzenburg, $1.35 @ $1.15; Newtown, $1.35 @ $1.15; Ben Davis, 90 @ 75; Gano, $1.00 @ 80; Winter Bananas, $1.50 @ $1.15; Winesap, $1.35 @ $1.15; Delicious, $1.50 @ $1.15; Grimes, $1.15 @ 95; York Imperial, $1.05 @ 85; Arkansas Black, $1.50 @ $1.15.

*

In the seven months ending with July we imported 122,163,556 pounds of clothing wool, worth $30,332,744; 16,717,949 pounds of combing, $4,195,753; and 67,388,213 carpet wool, $11,428,213; total $45,956,710.

Binding twine imports were 7,500,834 pounds, $687,596; jute, hemp and flaxseed yarns, 3,072,808 pounds, $601,050; burlap and other plain fabric of single jute yarns, 292,851,532 pounds, $24,801,572. Four-fifths of the last item came from British India.

Raw silk imports were 14,684,162, valued at $53,957,340. Nearly three quarters came from Japan.

"WELL, Jean, are you content about your examination?" "Yes, grandpa, I answered all the questions." "And how did you answer them?" "I answered that I didn't know."—Le Rire.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

AUSTRIAN, 24 years, wants situation on poultry farm to learn; no wages, lodging and table only. ILLERT, 231 East 48th St., New York.

WANTED—A competent farmer to run my 100 acre Connecticut farm, 50 miles from New York; shares or salary. Address R. C. T., care R. N.-Y.

POULTRYMAN—Desires position; married; 8 years' experience; modern methods; can get results. Address POULTRYMAN, care Rural New-Yorker.

POSITION WANTED—Married man, with small family, good milker, understands all kinds of farm work, and handy with machinery. F. C. F., Box 182, Chappaqua, N. Y.

PARTNER WANTED—Florida live-stock proposition, with capital, by university trained agriculturist; 500 acres rich clay soil, near Tallahassee. L. HEIMBURGER, Tallahassee, Fla.

WANTED—Single man; must be good milker, who wants to learn advanced registry feeding and work; state nationality, age, wages wanted and reference. New York State, care Rural New-Yorker.

WANTED—Position as manager of a large country estate by a practical farmer, horticulturist and stockman who can produce results; small family; references furnished. M. L. d., care Rural New-Yorker.

POSITION WANTED—By expert poultryman, fruit grower and practical mechanic, build poultry houses, etc., conscientious worker, strictly sober, excellent reference; Swiss-American, age 40, unmarried. JOHN H. GASSER, Bethel, Conn.

TWO STRONG CITY BOYS, aged 18 years, want place on farm for two years, to get practical experience preparatory for agricultural college course. Salary not important. Address ROBT. P. KEHOE, 98 Morningside Ave., New York.

STOCKMAN wants position on large farm; understands horse raising, the care of dairy cattle, sheep, hothouse lambs and hogs; also good working knowledge of poultry; long experience with registered stock, scientific training. R. D. C., care R. N.-Y.

WANTED—Position as herdsman or dairyman by one who thoroughly understands the business; an experienced feeder for tests; A1 buttermaker; ten-year practical experience; single, American, age 31; college training; good habits and record. X Y Z, care R. N.-Y.

WANTED—Position as Superintendent to take complete charge of farm. Married; college graduate; thoroughly understands crops, stock, dairying and up-to-date methods, particularly production of sanitary milk. Excellent references. JOHN HESSE, Smithtown, N. Y.

WANTED—Competent, experienced farmer, 300-acre Niagara fruit and stock farm, fine location, surroundings and equipments all up to date, good opportunity for man who can show results from past records; state in full references, age and salary wanted. CHESTNUT RIDGE FARM, Lockport, N. Y.

TENANT WANTED for improved 130-acre farm near Seneca Lake, Seneca County, New York; 16 acres grapes, 8 acres apples and peaches, rest tillable soil producing Alfalfa, corn, wheat and hay. Good water and accomodations for stock. School, church and R. R. near; progressive neighbors, ample barns, house and outbuildings. A No. 1 opportunity for the right man. Good reference required. HERMAN VAN VLEET, Olmstedville, N. Y.

PURE HONEY—Direct to Consumer; circular free. HARRIS T. KILLE & BRO., Swedesboro, N. J.

THREE CYPHERS four hundred egg incubators; cheap now. HAMILTON FARM, Greenlawn, L. I.

FOR SALE—Fancy Sweet Potatoes at $2.50 per barrel, or will exchange for fancy apples. C. A. NOTTINGHAM, Cape Charles, Va.

EXPERT INFORMATION—Making Cider Vinegar, quick process; forty years' experience; results guaranteed. JOHN P. CASE, Spring St., Trenton, New Jersey.

FOR SALE—Valuable fruit and poultry farm of 9 acres. Fine market. MOORE & SON, Nazareth, Pa.

FOR SALE—Fifty-three-acre farm, with improvements, near Bridgeton. A. J. ALLEN, Salem, N. J.

10 ACRES of good land; orange trees; good house, barn, all improved, $500. M. RIGEL, Yellow Pine, Ala.

I WANT to rent with option of buying a truck farm, 80 to 100 acres in Long Island, within 50 miles of New York. W. R., care R. N.-Y.

FOR SALE—Small place, Sullivan Co., N. Y., over two acres; good buildings; adapted for chickens and truck. JOSEPH ROGERS, Farmingdale, New Jersey.

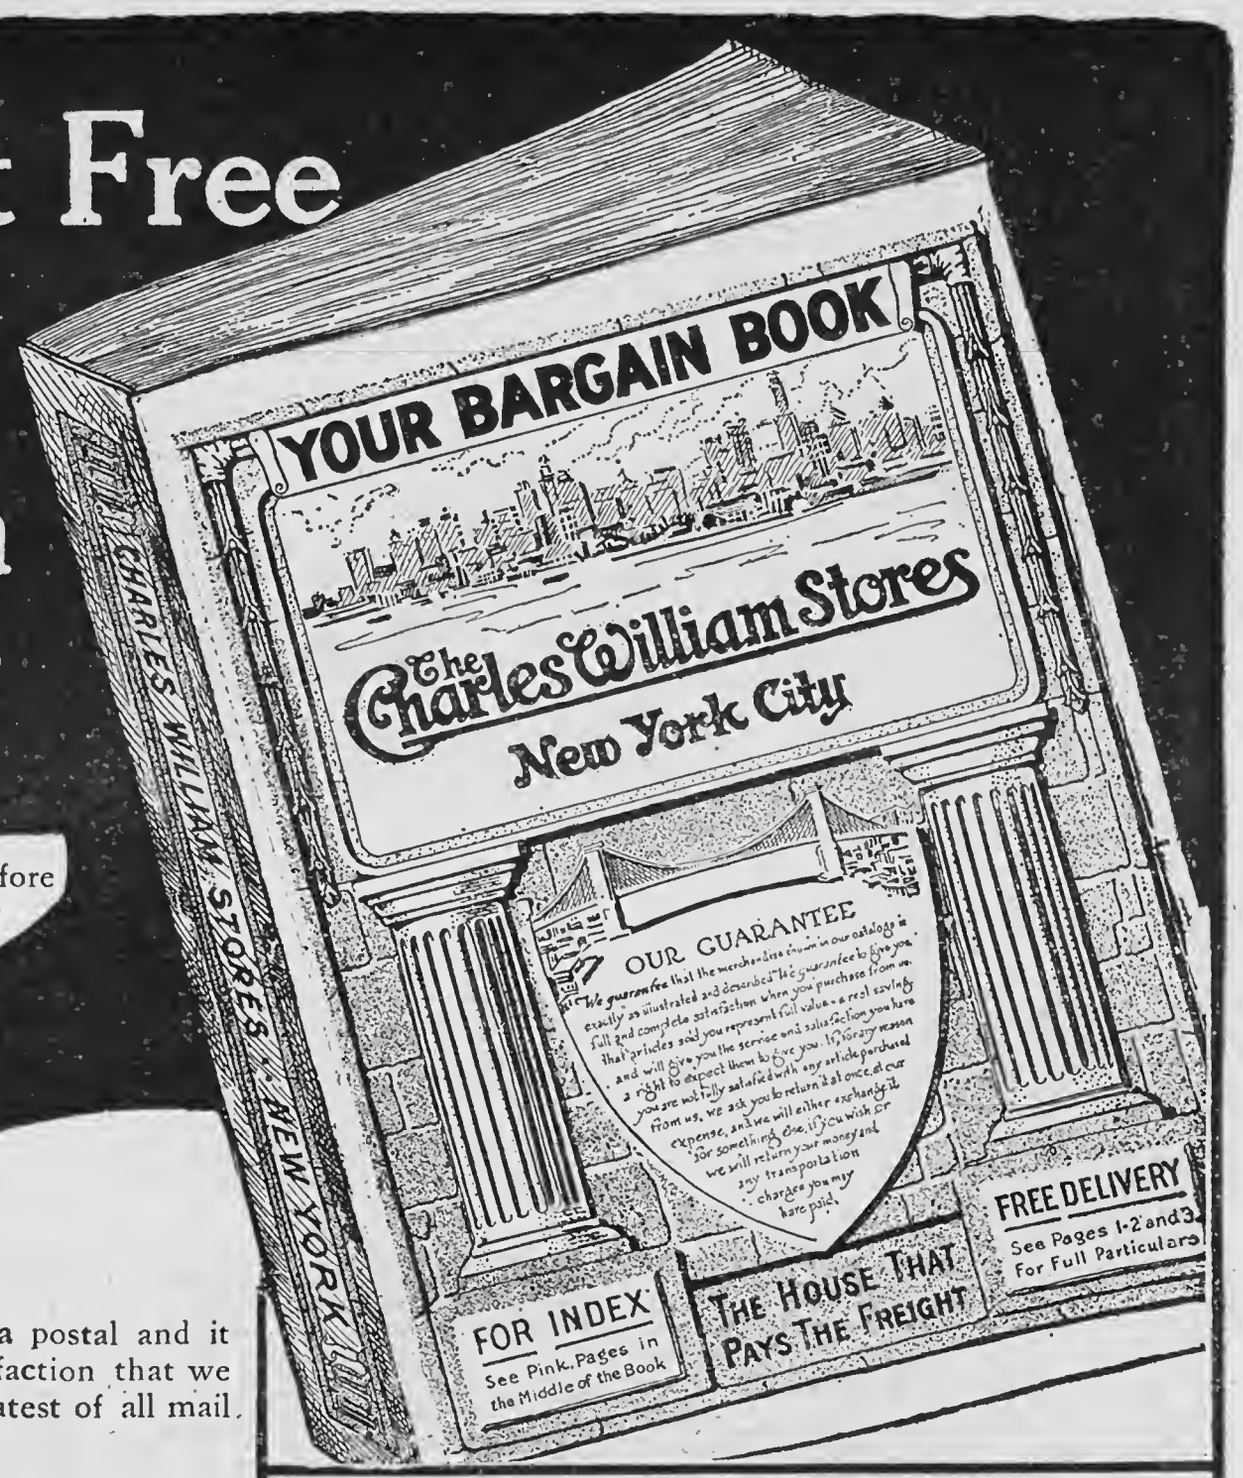
FARM FOR SALE—20-acre plantation Isle of Pines. Finest climate Winter and Summer. Grapefruit, oranges and pineapples; 5,000 American colony. Write DR. O. M. MYERS R— 16 State St., Rochester, N. Y.

FOR SALE—Successful poultry plant, location convenient to market, modern equipped buildings housing 900 hens; must be seen to be appreciated. Price reasonable; terms. Address BARGAIN, care Rural New-Yorker.

FARM FOR SALE—60 acres, with 6-room house and large barn. 3½ miles from L. V. R. R. station and market; 1 mile from village; pleasant, healthy location. Price $1,500 cash. Write to DANIEL HOGAN, R. D., Wyalusing, Bradford Co., Pa.

WANTED—To rent or work on shares, desirable farm well located, 12 to 24 good cows, by young married man, up-to-date, scientific, life experience, studied under Cornell, no bad habits; best references. J. HOLLISTER BARRE, Afton, N. Y.

What This Great Free Book Means to Every Farmer in the Land →



BEFORE you spend another dollar for merchandise of any kind—before you even think of shopping through any other mail order catalog or in town stores—*before you even turn this page*, tear out the coupon below or use a postal card and send for the new, great Charles William Stores Catalog—"*Your* Bargain Book."

That simple act is going to mean more to you than you can now imagine. No matter what prices you are now paying for the things you buy regularly, no matter how well satisfied you may be with your present method of buying, you cannot afford to miss this opportunity of seeing whether or not you are now doing the *best* by yourself. You take no chances, it costs you only a cent or two to mail the coupon or a postal and it means so much to you in dollars and cents saved and in greater satisfaction that we *urge* you just as strongly as we know how, to let us send you this greatest of all mail order catalogs *at once*.

The Only Big Mail Order Company that Pays Delivery Charges

The Charles William Stores is the only big Mail Order Company that saves you the cost, annoyance and inconvenience of paying transportation charges. Wherever you live and no matter how large or small your order amounts to, we pay *all* delivery charges on *everything* in the first 454 pages of "*Your* Bargain Book." We also pay the freight charges on 100 pounds or more of any merchandise in our entire 1186 page catalog (except farm implements, vehicles and safes) to any point in Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Maryland, Delaware, Virginia, District of Columbia, and Ohio. No other mail order company treats its customers so liberally. Think of it—we save you the transportation charges *in addition* to making you the lowest prices on merchandise.

Quickest Service from New York

Our methods are far in advance of other merchants. When you order from us you get your goods *quick*. New York is closer to you—saving railroad time. But the biggest saving comes with our rigid 24-hour time-table in filling and shipping all orders. Your goods will leave our stores the day the order is received. Seldom, if ever, are orders delayed beyond 24 hours. *Quick Service* is one of the most important rules of our organization and our customers show their appreciation in letters we receive every day.

Here's another tremendous advantage: New York is the greatest commercial center in America. 60% of everything you buy comes originally from New York no matter *where* you buy. Thousands of merchandise buyers from Chicago, Philadelphia, St. Louis, Pittsburg, Kansas City, Omaha, Des Moines, Minneapolis and hundreds of other cities crowd into New York once or twice a year to make purchases for home trade. *The Charles William Stores are located in the heart of New York.* Their buyers are always on the ground to get the latest styles, the newest goods and the lowest prices. We need only to send you "*Your* Bargain Book" and you will instantly note the difference between the quality of our *merchandise* and others—and our *prices* and others.

Your Bargain Book will Save You Hundreds of Dollars Every Year

The Charles William Stores offer you lower prices and better merchandise than you can secure anywhere else in the United States. That is the only basis on which we ask for your patronage. We *know* our prices beat them all because we *know* what others are asking for goods that do not compare with ours in quality. Just compare values—on men's, women's or children's clothing—on shoes, hosiery, underwear, dry goods—on furniture, toys, drugs, toilet articles, chinaware—on musical instruments—on sporting goods—on auto supplies, paint, hardware—on farm implements, harness, vehicles—and in fact on *anything* you may need for home, farm or personal use.

Then, in *addition* to lower prices and higher quality, we offer you such remarkably quick service that you'll be surprised. We treat every customer with respect and courtesy and guarantee everything satisfactory in every way or your money right back without argument, without unnecessary correspondence, without delay.

Mail the Coupon Now

We want every reader of the Rural New Yorker to send in the coupon or a postal today, without fail, or tear out coupon now and mail at the first opportunity. We don't want a single reader to miss this grand big 1186-page book because it means so much to you in many, many ways. Just the coupon or a postal—and the best printed, best illustrated and biggest money-saving mail order catalog ever published will be mailed to you at once, free and postage prepaid. Address as below.

THE COST OF GROWING WHEAT

Cut in Two by Changed Methods.

VALUE OF CROP RECORDS.—Farming is not and never can be an exact science. This is no excuse for the indefiniteness and the lack of knowledge of the costs of production, which characterize much of our farming. Carefully-kept records not only offer the most accurate information possible about a crop, but stimulate one to try to lower his costs of production, increase the efficiency of his labor, and modify his methods so as to get larger yields at a less cost per unit. At Beechwood Farm, in Monroe County, New York, careful records have been kept on all the crops for six years. These records are particularly interesting in the case of wheat, of which nearly 80 acres and 2,000 bushels have been grown during this period. The records which follow are given as a four-year average, from 1909 to 1912, and as a two-year average for 1913 and 1914. The reason for this grouping lies in the change in the rotation system, which was made in 1913, and which has greatly reduced the cost of production.

CHANGE IN ROTATION.—Up to 1913 our rotation had always been from five to seven or eight years in length, somewhat as follows: Corn, oats, wheat, hay one to three years, beans sometimes followed by wheat, but more often by oats, etc. After keeping records for four years, it was found that under our conditions, corn and oats were not profitable crops, and they were dropped from the rotation, except as substitute or emergency crops. Since 1913, the rotation has been one of four years, as follows: (1) beans, (2) wheat, (3) clover hay, (4) mixed clover and Timothy hay. The change has resulted in a much lower production cost for three reasons: (1) it permitted a rearrangement of fields (our soil is quite uniform and our fields level) so as to increase the average size of the wheat fields from 10.8 acres to 18 acres. Larger fields reduce the labor costs considerably, our experience has shown; (2) it made possible the sowing of wheat after beans without plowing, at the same time lessening the cost of preparing the seed bed; (3) the yield of wheat was increased because of the better seed bed, which it was possible to secure by the new method. This, I think, is common experience among western New York farmers.

A HOPEFUL YOUNG GARDENER. Fig. 541.

LABOR COSTS.—Labor costs are the largest which enter into the cost of producing wheat, amounting to from one-third to one-half of the total cost. Of this total labor cost, man labor comprises about two-fifths, and horse labor three-fifths. We figure the rates per hour for this labor as 20 cents for men and 15 cents for horses, after carefully keeping records to ascertain these costs. The tables on next page show the total amount and distribution of these labor costs for the six-year period.

From first table it will be seen that from 1909 to 1912, twenty-six and one-fourth man and forty-three and one-half horse hours were required to produce an acre of wheat. By making the change in the rotation the labor cost of production was reduced to 20 man and 21 horse hours. The cash value of this saving amounted to $4.58, as shown in the table which follows. The saving was effected chiefly by doing away with the necessity of plowing the land for wheat after beans, but also by a considerably lessened cost of preparing the land after beans had been removed, than of preparing freshly-plowed ground. The increased size of the fields probably decreased the amount of the labor. This saving was even more pronounced in the horse hours than in the man hours. It should be pointed out also that the total hours saved would have been still larger had the yield remained the same. The increased yield, however, increased the cost of harvesting, hauling, thrashing and marketing.

CASH COSTS SUMMARY.—The next table shows the labor converted to cash, together with the cash items involved in the production of wheat.

It will be noted that the cost of fertilizer was slightly less in the last two years than in the first four years, due to absence of manure. When manure was used 50 per cent. of its value was charged to the first crop, 30 per cent. to the second and 20 per cent. to the third. Since less equipment was used this cost was reduced slightly. Overhead expenses include beside taxes and insurance, all items chargeable to the farm, but not to any particular crop. These are distributed among all the productive enterprises of the farm. The land is valued at $100 an acre, upon which an interest rate of 5 per cent. is charged, as this is the rate at which money can be borrowed on mortgage in this community. By this change in rotation $4.09 was saved, practically changing the balance of the wheat from the debit to the credit side. Ninety per cent of the saving was in labor costs.

COSTS PER BUSHEL.—In order that it may be more clearly seen just what these figures mean, I have divided them into costs per bushel for each year in the last table.

In the last table from the total cost per acre has been deducted the value of the straw, the yield and price per ton of which are given. The value of the straw, none of which is sold, is based on one-half the current price of hay at the barn. The net cost of the grain per acre is then divided by the yield of grain per acre, giving a cost per bushel. In arriving at the average cost per bushel for each period, the net costs per bushel each year have been added and then divided by four and two years respectively.

REDUCTION IN COST.—From this table we learn that the cost per bushel of growing wheat on this particular farm has been reduced from $1.11, under the old method, to about one-half or 54 cents per bushel under the new method. The average cost per bushel for the six years is 92 cents, which is just about the average selling price. By the old method, growing wheat was a losing proposition; by the new it is fairly profitable. The difference is due both to a decrease in the cost of production and to an increase in the yield, both brought about by improved methods and culture. It is true that in the first four year average we had two very poor crops of wheat. The 1912 crop in particular was very poor, due to winter killing, and to an attack of the Hessian fly. But between the years 1909 and 1913, and between the years 1910 and 1914, there is a very fair comparison, since the yields are practically the same. In both cases the costs of growing wheat in the new rotations are nearly 25 per cent., or from 18 to 22

cents a bushel less than in previous rotations.

All the original labor and cash records were made by the tenant, Mr. Robert Hall, who finds that labor

records require about ten minutes a day in time. The owner has had the assistance of the U. S. Department of Agriculture's Office of Farm Management in tabulating the records. This co-operation is herewith acknowledged. M. C. BURRITT.

ABBREVIATED TALES.

Formalin on Wheat.

I am thinking of treating my seed wheat with formalin for rust. Is there any danger of poisoning chickens where wheat is sown near the barn, with the drill, as some of the wheat will not be covered? S. M.
New Jersey.

No. There will be no danger from eating such wheat. The effective principle in the formalin is a gas which does its work and then passes off. You need not fear about the wheat after it has dried.

A Congregation of English Sparrows.

I HAVE two beautiful elm trees before my residence in which the sparrows (I think the entire sparrow population of Albany) congregate every evening. I do not mind that, but the droppings from this congregation are something awful, the street is literally covered every morning. The nuisance is getting to be unbearable. Can you recommend some remedy for this? I do not wish to cut the trees down, as they are perhaps two of the finest trees in our city. If you do not know of a remedy, perhaps some member of the R. N.-Y. family can suggest an effective remedy which has been used with success.
Albany, N. Y. A. C. K.

R. N.-Y.—Our people have never failed yet to find a practical remedy for such troubles. Who can help in this? We have given several articles showing how these sparrows are trapped or poisoned. There may be too many of them in this congregation to make such methods practical. Who can tell?

Our Old Friend "Stonemeal."

LAST Spring our implement dealer, an honest and straightforward man, came to us claiming to have a fertilizer or ground rock containing from 14 to 16 per cent. potash, guaranteed it, or said the company did, to hold blight from cantaloupes or muskmelons, also tomatoes. He did not state whether the potash was soluble in water or not, nor did we take the time to inquire, as we were rushed to the utmost. The fertilizer was to cost $26.50 per ton, $3.50 per ton for freight upon arrival, and the rest if results were obtained. Our muskmelon patch of three acres drilled with the stuff has the blight, and would have been an entire failure, but we top-dressed with chicken manure and fine tobacco siftings. We used it on a row of tomatoes, a row of sweet potatoes, also a row of Irish potatoes. You can tell to the row where that stuff went. Do you know the firm and have you seen any of the stonemeal used and analyzed? The front of the sacks are marked thus: "100 lbs. Stonemeal, for horticulture, and pomology. Stonemeal Fertilizer Co., Inc. Works, North Paterson, New Jersey."
Pennsylvania. D. S. A.

R. N.-Y.—We have had several articles on this "stonemeal." It has been analyzed at the N. J. Experiment Station, and Dr. J. G. Lipman, the director, says it is a ground silicate rock to which some land plaster has been added. The stuff contained 1.73 per cent. of phosphoric acid and 4.13 per cent. of potash—not available as plant food. The station considers it worth about $3 per ton as plant food. Some of the farm soils in New Jersey contain more actual potash than the "stonemeal." As for the claims that it will prevent blight or other diseases we consider this "guff" pure and simple. No one but a man with a stone head would pay $30 a ton for stonemeal after reading the New Jersey reports.

HIT OR MISS REMEDIES.

REGARDING the question of non-bearing plum trees, tell your inquirer to put salt or brine around them, and they will bear. Say a good, big double handful of salt, or equivalent of old brine. I see you advertise "protectors" for fruit trees. I have 150 fruit trees in Hunterdon County, where there are lots of rabbits, but a coating of thick cow manure paste, applied to trunks in late Fall with a whitewash brush, is all the protection they need. No rabbit will touch them when thus treated. Try it. M.
New Jersey.

All sorts of recommendations and advice are still given for the control of various orchard troubles, and some of them are typical of the days when hit-or-miss remedies of all sorts were suggested for the control of insects. But to-day the successful fruit grower bases all of his remedies upon some fact in connection with the life history of the trouble, and recognizes that all remedies, not based upon scientific facts, may not only be a waste of time, but may cause damage. The statement that salt or brine will make non-productive plum trees bear is without a single supporting plant law. Plums are quite frequently unproductive because of self sterility, and salt has no effect upon changing the sex of the flowers. Again, plums may lose most of their fruit through severe attacks of the plum curculio, and a little salt or brine at the roots of the trees will not prevent the "Little Turk" from conducting his business. In some places the plum crop may be destroyed by frost nearly every year, and the application of brine at the base of the tree would be without avail.

Sodium chloride, or common salt, in quantity is also injurious to most of the higher forms of plants. In too many cases a practical test is made without leaving check or untreated trees so that incorrect conclusions are drawn.

In regard to protecting the trunks of fruit trees from rabbits by a coating of cow manure, we might expect that this treatment is likely to be successful. The rabbit objects to most any material with a strong odor, and lime-sulphur, soft soap, fish-oil soap, blood and numerous other materials, if maintained upon the trunks of the trees, will prevent attack. But the rabbit may not cause as much damage as mice, and the latter animals are not so easily repelled, especially by such materials as barnyard compost. Science is often ridiculed, but it is sifting out the remedies that are not founded upon the laws of plant and animal life. M. A. B.

RIPENING TOMATOES OFF THE VINES.

Can green tomatoes be ripened off the vines by wrapping them in paper? If so, would waxed or paraffined paper be better for this purpose than common wrapping paper? Are there any other ways of ripening green tomatoes that will not ripen on the vines before frost?
Ohio. H. M.

Green tomatoes that have reached nearly or quite mature size can be ripened off the vines with very little trouble, and still be of fairly good flavor, but the half-grown or smaller ones, thus ripened are of very poor quality, being extremely sour and of very poor flavor; they are tomatoes, which is about all that can be said of them. I have not tried wrapping them in paper for the reason that they require watching during the ripening period, and should not be handled any more than can be helped. To wrap them in paper would interfere with close observation, and would also entail frequent handling of the fruits to ascertain what progress they are making toward ripening, which would be considerable trouble, and be of more or less injury to them.

I have never bothered much with fruits under three-quarter size or growth. When picking them it is well to sort them into about three lots, the first being those nearing the ripening period, the second, those somewhat greener, and the third, those three-quarter size and smaller. After being graded each grade should be placed separately, on trays or shelves one layer thick, and set anywhere that is dry and a temperature not much below 55 degrees. A lower temperature will retard ripening and in some of the smaller fruits prevent ripening at all, while a higher temperature will hasten ripening of all the sizes. Exposure to full light (but not to the direct rays of the sun) seems best for them. K.

VALUE OF STRAW AS MULCH.

THE Spokane Review prints the following item about burning straw, formerly the common practice in wheat-growing sections:

Pratt county (Kansas) farmers are finding out that it costs them five bushels of wheat to the acre to burn their straw stacks or let them rot. Using straw mostly as a top-dressing for Winter fields, these farmers find that it helps to keep the soil from blowing, conserves the moisture and adds to the fertility. The laborious practice of scattering the straw by pitchfork has been abandoned, and spreaders are used instead.

We never did expect that Kansas farmers would teach lessons of intensive farming to our Eastern market gardeners. There is no question about the value of this straw when worked into the soil. But if a Kansas farmer loses five bushels of wheat by not plowing under the straw the New York or New England farmer will gain five bushels and more by putting under a cover crop. We think it is a sin to let our corn, potato or garden crop soils lie bare through Fall and Winter. Rye and other cover crops seeded in the corn at the last cultivation will prevent losses from the soil and give a great crop of green material to plow under. All this without interfering with other crops. The thing is so simple and plain to those of us who have tried it that we cannot understand why farmers are willing to let their cornfields go bare through the Fall.

OUTLOOK FOR PHOSPHORIC ACID.

THE U. S. Geological Survey makes this prophecy regarding our future supplies of phosphoric acid:

While the States of Florida, Tennessee, and South Carolina have for many years been the principal sources of phosphate rock in the United States, it is believed that the main production in the future will probably come from the great deposits of phosphate rock on public lands in Idaho, Utah, Wyoming and Montana.

At one point in Idaho alone it is estimated that two and one-half billion tons of high-grade phosphoric rock are in sight. This region is as yet in the wilderness, but it will be reached by railroads when the phosphate is needed. With these constantly new discoveries of phosphate deposits there seems to be little reason for the present generation to fear a shortage in this plant food. With the great majority of our soils phosphoric acid is the most needed element in fertilizers, and Nature has evidently hidden away abundant supplies of it in her ample American pockets.

CHICKS SWALLOWING NAILS.—The communication from W. H. Macy, on page 1197, regarding chickens swallowing nails, interests me, for he is the first poultryman other than myself of whom I have heard having this trouble. Three years ago I started in the poultry business, raising 2,500 White Rocks the first year in a new plant. The plant being new there were undoubtedly a large number of nails lying about, but I had no trouble of this sort. For the past two years I have been raising White Leghorns, and have had a good deal of trouble in this respect, and out of flocks of from 3,000 to 6,000 have lost many chickens from this cause. They have swallowed tacks both single and double-pointed, poultry staples, lath nails, eight-penny nails, eight-penny finishing nails and wall-board nails, which have a head one-half inch in diameter. During these past two years I have been troubled with rose bugs, and the poison from these bugs has thrown the digestive organs of my chickens very much out of condition; this may account for their swallowing such indigestible materials. I have watched the chickens very closely, and I find that the Leghorn is much more active, I might say more playful, than the Rock, and when one of them finds a nail he takes it in his beak and tears about the coop with half the others after him, and to avoid losing it he swallows it. I have come to the conclusion that the best way to avoid this loss is to keep such things out of their reach.
Connecticut. THOS. W. MOORE.

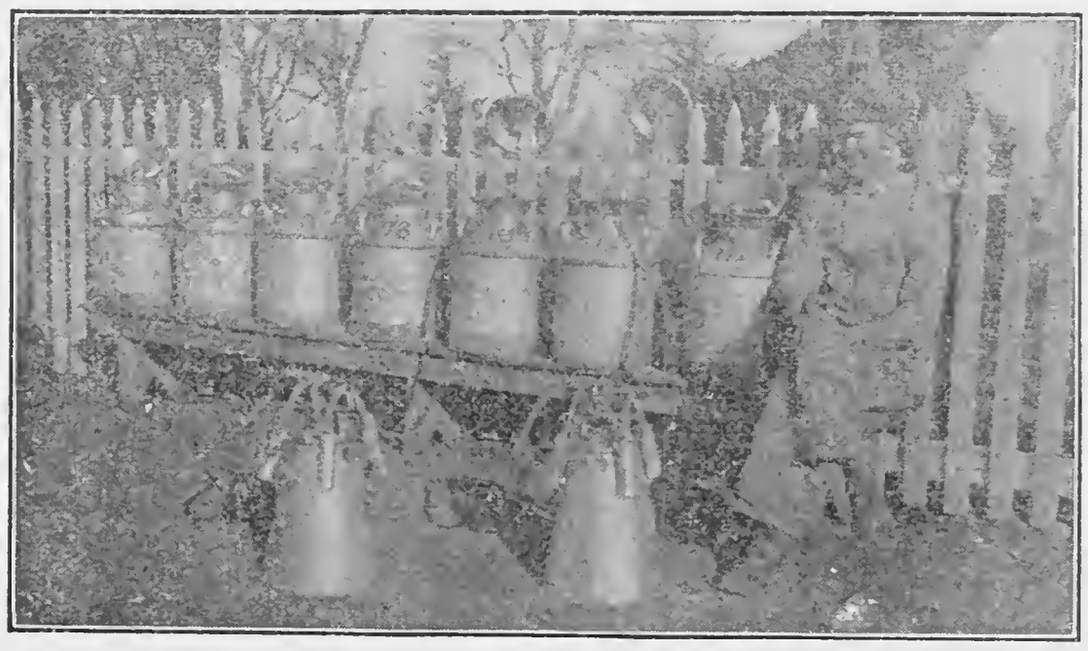
AFFLICTED DAIRYMEN AND MILKING MACHINES.

SINCE the milking machines came upon the market, we have been interested in finding cases where afflicted people who are more or less crippled have been able to use the machines in order to keep up their dairy work. We have found a number of cases where men brought up from boyhood to milk cows, have suddenly met with an accident which deprived them the use of one of their hands. As is well known, men in such a situation find it hard to take up other lines of farming. When a man has milked cows for a number of years, it is difficult to take up other work, yet it would seem that the loss of a hand or a portion of it, would ruin a man's ability to milk and thus drive him from the dairy business. It would be a good test for the milking machine if it would enable such people to come back after their accident and still be able to take care of the cows. We have found a number of cases where this very thing has been done, and pictures of three such men are given this week. The facts are sent us by Mr. Walter E. Cox of Pennsylvania.

ARTHUR HALL ADJUSTING THE MACHINE FIG. 542.

Mr. Charles Weaver, of Illinois, lost his left arm at the elbow. This loss occurred about 18 months ago, and at that time he expected that he would be obliged to give up his fine dairy, which he had started shortly before, and which was doing well. He heard of the milking machine, and made a trial of it. He is now milking 18 cows in less than an hour with this machine. He learned to operate the machine and handle the cups in a very few days, and in about two or three weeks he had the system in operation perfectly, doing more milking than ever before, and taking care of his dairy without trouble. It is needless to say such a man and his family thoroughly believe in a milking machine.

The next picture, at Fig. 544, shows Mr. Cecil Weaver, of Kansas. His father is one of the largest milk producers in the community. Cecil had the misfortune to lose a hand several years ago. He grieved because he wanted to be a dairyman, and felt that this accident had deprived him of his earning capacity in that line. It did not seem possible that a boy with one hand would ever become a practical milker. At the present time this boy is milking 40 cows by himself, by making use of a milking machine. He is thus able to keep up with any of the others, while, but for the milking machine, he would be absolutely out of the race. A separate contrivance has been made which is strapped over the boy's injured arm, and this substitute for a hand enables him to take care of the milking machine. The other picture, at Fig. 542, shows Mr. Arthur Hall, of Virginia. Mr. Hall lost his arm, and yet he is able to use the milking machine, and conducts a profitable dairy, and is himself responsible for milking 30 good cows. As most afflicted people of intelligence are able to adapt themselves to conditions, Mr. Hall is able to use his knee to adjust teat cups to the cows, and does it quickly and in good style. We print these pictures of milking machines in order to encourage others who may have met with a serious accident and who, perhaps, feel that the loss of a hand has driven them forever out of dairy industry. They need not feel this way, for the milking machine, as in the case of the men here mentioned, may give them opportunity to come back and continue their work. They will all tell you, however, that the milking machine will not run itself. It is a more or less complicated device, and needs a careful, intelligent man to handle it properly.



CHARLES WEAVER, HIS MACHINES AND MILK CROP. FIG. 543.

FALL SELECTION OF BREEDING HENS.

TRAP-NESTING.—Mr. Hunter's answer, published on page 1177, in response to Mr. Mapes' request for a "rule-of-thumb," prompts me to suggest that Mr. Hunter offers a poor substitute for a good "rule-of-thumb." Years of experience with trap-nests and the observation of the trap-nest records in the laying contest at Storrs have convinced me that the farmer-poultryman can select his great layers without the expense involved in obtaining accurate individual records with trap-nests. All the farmer-poultryman has to do is handle his flock over early in October, and band those that he finds are then laying. The trap-nests and the contest records teach us that practically all, if not all, of the great persistent layers are then laying, and that the non-layers are then all out of commission. By this method you can avoid the use of the trap-nests, and for the purpose stated, duplicate the trap-nester's work. Of course, you cannot by this plan get the individual records of each hen, but you can get the cream of your flock into the breeding pens, and you can greatly improve the laying capacity of your flock.

THE TOUCH SYSTEM.—Mr. Hunter states that "with such pullets the pelvic bones being one finger's width apart, indicates that the bird will lay in about six weeks' time; two fingers' width apart indicates that the bird will lay in about four weeks; three fingers' width apart that she will lay directly, if not laying." This is a trifle amusing as a positive rule, when you consider the difference in pullets and the different ways in which they may be housed and fed, and worst of all, the difference in size of different people's fingers. Whose fingers is he talking about, and whose pullets?

LAYING BREEDERS.—But why discuss pelvic bones of pullets when prescribing rules for selecting breeders? My experience has taught me to stay away from the pullets when selecting breeders. Early in October we go through our pens of hens and band the layers—those whose pelvic bones are wide open and loose on their hinges. Our pens contain 100 hens each. We go into a pen in the dark and catch all the hens and put them in crates, then we turn up the lanterns to their full capacity and one man hands the hens to the man who does the selecting, and he passes judgment upon them. Those with bright red heads, with wide-apart pelvic bones, showing strong vitality and good weight, are handed to either of two men supplied with spiral celluloid bands, while another man keeps a record of the total count and the count of breeders. Those that show no promise of profit are put into other crates and shipped alive to market, and the others, not chosen for breeders, are kept for another year as layers when we have room for them. About November 1st we will run over these banded breeders and add another band to those that are still laying. This will give us a few "crackerjacks," that we consider very valuable. The above method can fairly be called a "rule-of-thumb" and its employment bears no reasonable resemblance to "main strength and stupidness."

SHORT-TIME LAYERS.—Your farmer-poultryman has not the time to trap-nest his stock the whole year, and to do so for any less period would be of little use, as it is well known by those familiar with trap-nest work that many otherwise promising layers quit at the end of from five months onward, and that some layers making a poorer record for six months will, by their persistent work, do more in the year than those of greater earlier promise. Mr. Barron knew whereof he spoke when he advised that we trap-nest through the year or not at all, and I have no doubt that his experience tallies with that of anyone who has practiced trap-nesting to any extent.

FALL AND WINTER LAYING.—Mr. Hunter told the whole truth when he wrote: "The birds which are the great layers are certain to be late Fall and Winter layers, and it is equally certain that the birds which are not late Fall and Winter layers are not great layers at all." This being admitted, what excuse is there for advising six or seven months' labor with the expensive trap-nest? Why not pick them out in the Fall and early Winter and be done with it, and not shroud the whole subject with so much mystery? It can be done easily and surely and quickly. I know because I do it, and I know that no other work on the farm pays as this does.

FRED'K M. PEASLEY.

FIGURING PROFITS—35-CENT DOLLAR.

I NOTICED the article on page 1149, in which Mr. Peasley submits a balance sheet containing the results of a number of experiments in growing potatoes. And I noticed that, in the first experiment, with an investment of only $65, he made a net profit of $55; in other words, a net profit of nearly 85 per cent. Apparently this estimate does not take into consideration the rental of the land. But, assuming this to be $10 an acre, which is bank interest on a valuation of $200 an acre, and is certainly enough, he still has a net profit of 60 per cent. And this, with potatoes selling at only 75 cents a bushel. Now, if Mr. Peasley can make this net profit, it is only a lack of management or a lack of business efficiency that prevents every other farmer from making a similar profit. This being the case, is it not to the advantage of the farmer to pay such attention to the details of his own business as will enable him to make this profit, rather than to grow potatoes at a nominal profit, or, even as it is claimed, at a positive loss, while he spends his time sitting on a soap box endeavoring to devise some scheme wherey he may put the 65 per cent. profit that he says the middleman robs him of, into his own pocket?

Now a word in regard to this 65 per cent. At the present time I am not growing potatoes. Instead, I buy them for my own use. Recently I met a farmer who was selling potatoes from his wagon, and he had just five bushels left. He offered them to me at the rate of $1 a single bushel, or 90 cents, if I would take the five bushels. I saw a good chance to help in getting rid of the robber middleman, and so I bought the five bushels and went about my way, while the farmer drove to my house with the potatoes. At night, when I returned home, I found that my wife had also bought a bushel of potatoes from the grocer, who had obligingly carried them down cellar, while the farmer had left those that I had bought from him on the piazza. I found that she had paid the grocer but 70 cents a bushel, while I had paid the farmer 90 cents for potatoes that were not quite as good. And I found, also, that the grocer's bushel weighed an even 60 pounds, while the farmer's bushels weighed but from 48 to 51 pounds, including the sacks. Now, as a matter of information, I would like to know where the 65 per cent. that the middlemen are said to have robbed someone of, may be found. I am not high enough in percentage to locate it. C. O. O.

Vermont.

R. N.-Y. — It was clearly stated that the figures given by Mr. Peasley were estimated. He wanted to learn how much fertilizer he could afford to use. So he put different quantities on small plots or rows, and figured the yields out to acres. We thought this was clearly understood. No one would expect that a full acre would work out exactly the same as a short row, but the comparison told the needed story about fertilizers. As for the sec-

CECIL WEAVER WITH HIS MILKING MACHINE. FIG. 544.

ond matter, why did our friend buy his potatoes before comparing prices? It would have been good business to learn first what the farmer and the grocer charged, sample the goods and take the better bargain. That is what he would do in his own business. Most of us have at times paid storekeepers more than we could buy the goods elsewhere for because "we ought to support home trade." We never asked anyone to pay a farmer more than his produce was worth. As for the 35-cent dollar, there are many cases where farmers sell direct. On the other hand, potatoes are selling in New York at 40 cents a peck, while farmers in Western New York are offered 30 cents a bushel. We refer to the average returns —not to certain favored business.

CANDIDATE FOR GOVERNOR.

WE have received many letters or notes like the following:

How are we to know who to vote for this year?

There has not been in many years an election in which the issues were as complicated as, or less clearly defined than is the case this year. In order to present the case fairly we have asked a supporter of each of the four candidates to state briefly why farmers should vote for either of the following:

Charles S. Whitman—Republican.
Frederick M. Davenport—Progressive.
Martin H. Glynn—Democrat.
William Sulzer—Prohibitionist.

The men who have prepared these statements fully understand conditions, and what they say may be considered typical arguments for each side.

Why I Vote For Wm. Sulzer.

We farmers have expected great things of a primary election law, and here we are well past the first primary under the new law. "Watchman, what of the night?" As I see it the bosses of both the principal parties are in the saddle, riding confidently towards election day, hardly taking the trouble to look back and see if we tag behind, so accustomed have they become to a blind acceptance of the party whip. I for one propose to bolt, and take this occasion to vote a Prohibition ticket as a sort of protest. I am in favor of the principle of prohibition and have always supported it locally but have not been in the habit of voting a prohibition ticket for Governor. I shall do it the more gladly now, since I can at the same time help to vindicate the man of his convictions as Governor, who dared to throw down the gauntlet to the party boss. The disgraceful way in which the whips of the two party bosses were applied in order to discourage future Governors from attempting to disregard their orders was a disgrace to the Empire State and an insult to the electorate, which I for one have not forgotten.

I regard the prohibition question in State and nation as of vital importance to all classes in general and farmers in particular. The only other domestic problem that approaches it in importance is that of equal suffrage. Local option at best is only a makeshift. Rural communities cannot, under the present system, escape from the curse of rum. We may close the saloons in our own towns, but escape from the demon's talons is impossible so long as cities or towns in contiguous territory lure our boys and hired help with open saloon doors, and windows in which are conspicuously displayed the license of the sovereign State to help in their destruction in consideration of a few paltry dollars paid into our treasury.

Fealty to party at any cost has been the bane of our experiment at self government. Those who are looking for office at the hands of a particular party practice it for business reasons and the rest of us have followed suit without giving the matter much thought.

It is a matter of history that bolters gave us the Republican party and Lincoln with his level head at a time when he was sorely needed. It is equally a matter of history that bolters from the Democratic party gave us Wilson with his level head at a time when a level head is also sorely needed. The decent element is surely in the majority in both State and nation, and if we now take this opportunity to bolt and vote the Prohibition ticket we can kill two birds with one stone. We can give the party leaders who are in the saddle and riding confidently towards election day a big jolt when they look back on election day and count up the size of their following. At the same time we can give the drink evil a blow that will be a big help towards the saloonless nation we all would like to welcome during our lifetime.

Why Davenport Should Should Be Elected.

From the viewpoint of the farmers of the State the political situation is a very simple one. We have no National issues before us this year. We have to decide only the kind of government we want to have within the Empire State. Do we want the Hughes type of clean, efficient government in the interests of all the people alike, with laws administered economically by honest officials; or do we want the Barnes-Murphy combine type in the interests of a few (mostly contractors), with laws administered for the enrichment and furtherance of political machines and their hirelings? That is the whole problem before the voters of New York State today.

Frederick M. Davenport was in the State Senate during Governor Hughes' term, and was one of Hughes' staunchest supporters, fighting with him at every step against the bi-partisan system of Barnes and Murphy. He inherits that fight and is the only candidate for Governor who does inherit it. He has proved over and over again that he is for cleanliness and efficiency in every department of our State Government. No boss has any string on him in any way. If elected he will go into office with free hands, with a record for ability and rightmindedness, determined to fight to the last ditch for honesty and decency in every office, and for the prevention of every sort of graft.

As taxpayers we farmers have much at stake this year and we have an opportunity to protect ourselves better now than ever before because we have simply a choice of whether we want every dollar to bring in a dollar's worth; or whether we want the State to suffer from a 35-cent dollar. No reasonable man can ask Mr. Whitman to turn and bite the hand that is feeding him. Nor can we expect Mr. Glynn to do it. We know that neither of these gentlemen will be a free agent if elected. We have had recent forcible proof that they cannot be free agents. Therefore from them we can expect only a 35-cent dollar. We must have a clean man, a man of proved ability and fearlessness and bound only by his duty to each and every one of us. Davenport is the only one who fills the bill. Unless we elect him we can have no hope of the appointment of the proper men to administer such laws as our Land Bank law, our Food and Markets law and other agricultural laws.

The Political Argument For Mr. Whitman.

I am a Republican, and I frankly make my appeal to members of that party. Mr. Sulzer and Mr. Davenport cannot be elected anyway. For many years the farmers of New York gave great Republican majorities. By doing so they controlled the policy of the State, and to a large extent that of the nation as well. We were well and intelligently governed. Now and then, so-called "leaders" got away from us, but the rank and file of the Republican party have always pulled them down and cleaned up the records. New York State never occupied a stronger or more prominent position than when its policies were controlled by its intelligent farmers through the Republican party. The so-called Progressives can accomplish nothing this year by themselves, while, back in the Republican party, they could join with us and dominate it. The way to return to sound intelligent government in New York is to put back the Republican party—made wiser and cleaner by its trials and defeats. Mr. Whitman is a clean and able man. He received a unanimous vote in New York City for district attorney and has sent some of the most notorious crooks to jail. This unanimous election was the highest possible testimonial to his ability and courage, and in the Governor's chair he will be equally fearless and fair.

In all the idle talk about "bosses" no one ventures to say a word against Mr. Whitman's character or ability. As Governor he will give the State a clean, able, and sane administration without fireworks or folly. That is what our practical farmers want—and what they need. They know that with the primary and with the experience of the past two years they are better able than any other class to hold a Governor up to his duty.

The Argument For Gov. Glynn.

The farmer's ideal of good citizenship will impel him to vote for Governor Glynn. The farmer demands honest, efficient and capable service from public servants. Governor Glynn has qualified in these requirements. He has made a record that measures up to the farmers' demand for economy. He has applied sound business principles to the business of the State, and as a result he has saved $11,000,000 to the taxpayers of the State in one year's budget.

During his brief term as Governor he has particularly devoted himself to the interests of the farmer. For years farmers demanded a real primary law and the Australian form of ballot. Governor Hughes responded to their demand; but the party bosses opposed him, and he lost. This was one of Governor Glynn's first reforms. He won where Governor Hughes failed, and voters may now select their own candidates independent of the party bosses.

Governor Glynn secured the best workmen's compensation law in the world. It protects workmen in hazardous employments, but exempts farmers from its requirements. If workmen understood this law as they will later, they would cast a unanimous vote for Mr. Glynn.

The Land Bank is one of Gov. Glynn's special measures. It is now nearly ready for business, and will soon be ready to loan money on farms mortgaged for long terms, and on easy payments. New York is the first State to adopt a farm credit system, and without the active insistence of Gov. Glynn it could not have been secured.

Gov. Glynn soon learned the meaning of the 35-cent dollar. He learned that it cost 65 cents to deliver a dollar's worth of food. For 15 years other Governors have been told the same thing, but Gov. Glynn was the first to attempt a reform. He secured a law to create a Food and Market Commission by which farm food products can be delivered from the farm to the consumer at a price governed by the law of supply and demand, and he provided for a sure and prompt return to the shipper. The saving in this system of distribution can be estimated only in millions.

To put these coöperative measures in operation Gov. Glynn secured appropriations of $35,000. He made $50,000 available to fight sudden ravages of insect pests; and $5,000 to investigate tuberculosis in cattle. He also righted an injustice of two years standing by securing prompt payment to farmers for $217,000 worth of cattle that had been previously destroyed and payment unjustly withheld. While vetoing needless appropriations and cutting useless expenses, he initiated these wise and needful expenses himself in the interests of the people and the farms.

Farmers are opposed to a single tax on land, by which other forms of wealth would escape taxation entirely. His two leading opponents have pledged themselves to favor this policy. Gov. Glynn has refused to do so.

In times of political excitement, leaders appeal to the party spirit of voters; but party lines today are actually pretty dim. Gov. Hughes and Gov. Glynn represent opposing parties; but in principles and policies they have more in common than either of them has with the sordid politicians of his own party. The man who voted for Hughes may with greater reason on the same grounds vote for Glynn.

The farm measures initiated by Gov. Glynn need development. They have a friend in him. He will naturally want to make the most of them. A new man would hardly wish to develop Gov. Glynn's pet measures. He would have other policies nearer to the interest of a city-bred man, and these farm measures would not be worked out to their possibilities.

As Secretary Giles of the State Grange has well said, for the first time in the history of the State farmers found the doors of the Executive Chamber wide open by Gov. Glynn. He has taken the initiative for them in every just and useful measure. To turn their back on him now would be a refusal to reward the service of a friend. Farm influence would not recover from such a mistake in twenty-five years.

In an effort to detract from the credit due Gov. Glynn, his opponents have foolishly put themselves in opposition to these measures which have been demanded by farmers without regard to party. With insincerity they exhibit ignorance of farm needs. With this position now, what could farmers expect from them after election? Consistency would require continued opposition. Hence the self-interest of the farmer prompts him to vote for Gov. Glynn.

Farmers know what to expect from him, and they are not likely to take chances with another. Lincoln's admonition appeals to them with special emphasis at this time: "Don't swap horses while crossing a stream."

ADVERTISING GRAPES.

"Advertising multiplied the number of consumers of grape juice by a dozen, and advertising should now be directed more strenuously in behalf of the apple," says Louis Erb, president of the Apple Advertisers of America, and adds: "Advertising will increase consumption 50 per cent. It takes money to advertise the apple and about the only means the organization has for securing it is by selling stamps to growers to be placed on packages and barrels. The stamps for barrels cost but two cents each, and for boxes one cent." This in case of barrels is less than one for advertising. The manufacturer spends several times the 1 per cent., and in some cases a fair proportion of his profits, and he considers advertising the cheapest way to secure sales.

California as the future wine center of the world, seems assured as the result of the European war. The damage to vineyards in the warring zones is so great that recovery will require some years. California produces nine-tenths of the 50,000,000 gallons used in the United States. The California Wine Association is said to be doing the largest business in its history, the Eastern demand having been doubled since the outbreak of the war. The association is advertising for wine grapes, offering $10 the ton.

"For the Lard's Sake, use Bowker's Fertilizers; they enrich the earth and those who till it."—*Adv.*

Big Apple Trees
At Little Prices
The time for planting cheap trees is past. You want big, healthy specimens for your new orchard, and to get them you should pay a fair price. My apple trees are extra good, with splendid roots, sturdy trunks, well formed heads, and my prices are low for such fine stock. My free book tells more about these trees; you may have a copy free if you send me a postal today.

VAN DEMAN'S FRUIT NOTES.

Harvesting Black Walnuts.

ON harvesting Black walnuts for home use should the hull be removed?
North Clarendon, Vt. A. N. H.

It is very desirable to hull the walnuts as soon as gathered, and dry them, for otherwise there would be a lot of trash to bother when cracking them. When I was a boy my hands were brown every Fall with the stain from hulling walnuts. The easiest way to get off the hulls is by running them through a cornsheller.

Pruning Young Peach Trees.

COULD young apple and peach trees that were planted last Spring, and have made a rapid growth, be clipped this Fall to ripen their wood for Winter?
Northville, Mich. E. J. K.

It sometimes occurs that the growth of fruit trees, and especially those that are very young and not yet in bearing, continues so late in the Fall that, in some sections it is hurt by early freezing. This is apt to be the case in northern Michigan, where the Springs are late, and hard frosts come early. If the young growth is very late in ripening it would be well to clip it back to hasten maturity. At this time, however, the season is so far advanced that it may be too late to do so with benefit to the trees.

The Clairgeau Pear.

WILL you give me some information about the Clairgeau pear, as I expect to set out a commercial orchard next Spring, and am undecided between this variety and the Kieffer? Is the Clairgeau tree a thrifty grower? Is it as healthy a tree as Kieffer? E. K.
New York.

The Clairgeau pear is one that has long been grown all over the world where pears succeed, and yet it is not very popular either as a market variety or for home use, unless it is in California, where it is grown to some extent and sent to the Eastern markets. The tree is a good grower and bears well, but it is about as subject to blight as any variety. It is not nearly so healthy as the Kieffer, but the fruit is of better quality. However, it is far from being the rich flavor of most of the good pears, and is not esteemed for eating in the fresh state, nor for canning. The Bartlett is far better, and so are the Sheldon, Anjou and Bosc. It would be a good plan to plant Kieffer instead of Clairgeau if the design is to cater to the low grade markets, but it would seem to me better to plant the better kinds for the better class of trade. Bosc top-worked on Clapp or some very strong grower would be a good one, and there is no pear that sells better in the fancy markets nor that is better to eat.

Pronunciation of Kieffer and Van Deman.

HOW do you pronounce the name Kieffer? Is it Ke-fer, long e, accent on Ke, or Ki-fer, long i, accent on Ki? Also pronounce Van Deman correctly. It is *Van* Deman, accent on Van, or Van *De* man, accent on De? N. B.
New Cumberland, Pa.

N. B. has made the mistake of spelling the name Kieffer with the e first, Keiffer. The old German, after whom the pear was named, had been reported, on good authority, to have spelled his name Kieffer, and said it should be pronounced according to German rules, which would be Kefer. If this i came last it would be Kifer. As to the pronunciation of my own name it is properly Van *De*man, for it is an old German name and the *Van* (or Fon or Von, as it is in the native language), is a prefix to the real name. In the original German family manuscripts which our family possesses, there are differences in the spelling, but the name as translated into English on our grandfather's Revolutionary war records was first "Vandement" and later it is "Van Deman." The family is not unanimous in the accentuation but the majority say it should be Van *De*-man. H. E. VAN DEMAN.

GROWTH OF GRAFT.—Three feet growth from a graft in a season, page 1178. But that is nothing; I had five feet growth last Summer from a Belleflower, bud set the previous August. It is still in evidence. W. L. S.
Pennsylvania.

"DID I tell you of the dreadful fright I got on my wedding day?" "S-sh! No gentleman should speak that way of his wife."—London Evening Standard.

NOTES FROM A PRODUCE SELLER.

SUCCESSFUL market gardening requires more work than any other line of agriculture, and when one sells his produce direct to consumers on a regular route from a wagon, this fact is especially brought home to him. We have been engaged in this business for some years and know something of its hardships and drawbacks. We are somewhat inclined to warn the indolent, and also those who have not plenty of strength and help, not to begin as they would be certain to make a failure. In selling produce direct to consumer, the grower has the advantage of getting the consumer's entire dollar. It is not easy to get such a trade, and after it has once been obtained, it requires a constant effort to retain it.

Take, for example, my trip, made on Friday, September 18, on which I made the heaviest delivery of the week. As I make it a point to supply my customers early in the day, I am obliged to rise early so as to reach my first customer by six o'clock in the morning, the city being four miles distant. The greater part of my load had been ordered on a previous trip, while some of it had been ordered by 'phone. The complete delivery was finished before 10 o'clock, and I was able to reach home by 11 a. m., the entire load bringing nearly $17.

Part of the afternoon was spent in work around the garden, and towards evening a load of produce was made ready for delivery Saturday morning. There is a good deal of work connected with the proper preparation of the various vegetables, as customers as a rule are quite particular, and I am therefore required to attend to details in this matter. I carry scales and sell by weight, excepting beets, radishes, onions, and celery, these vegetables being sold in bunches of from four to five early in the season, increasing the size of the bunches as the season advances, until eight to ten are put in a bunch. The well-to-do generally object to culls, and so these are sold in the foreign quarters of the city, the prices obtained usually being enough to pay for the handling.

It is my constant aim to have a full line of such produce as my customers require, and to build up such a reputation for honesty and fair dealing that they will not hesitate to buy anything from me on my recommendation. I also make it a special point to make good such losses as my customers may lay to my charge, and in some cases those for which I have not been responsible. By doing so, I retain the good will of my customers, and this pays greatly in the end. Also, if through oversight any stale stuff was delivered to any customer, I replace it with fresh stuff.

While ringing a hand bell does well enough to call out my customers as I approach their houses, I do not use this in soliciting the new customers. To get these, I fill a market basket with samples of the vegetables most in demand at the time, and go from house to house, calling at the kitchen doors, leaving the wagon as near to the side of the street as possible.

There is considerable aversion to the house to house canvass by most market gardeners, as they feel that the housewife might consider them in much the same light as they do the book or medicine peddler. In this they are greatly mistaken, however, as the average housewife is very much pleased to have fresh vegetables offered at her own door. She can see almost at a glance that the produce is fresh and attractive, and this alone often brings a customer without any other argument. City people readily know the difference between vegetables that are fresh from the garden and those that have lain around in the stores for three or four days. The house-to-house canvass takes time and patience, but thus far I have yet to learn of a better method in soliciting new trade. D. L.
Indiana.

THE Teacher: Now, children, listen to this. Thomas Campbell, the famous poet, once walked six miles to a printing office to have a comma in one of his poems changed to a semicolon. Why did he take all that trouble? Bright Boy: 'Cause he didn't have no tellyphone.—Cleveland Plain Dealer.

Lutton's Miniature Glass Gardens

Ordered today will reach you in time to prepare a garden that will supply your table with delicious vegetables and beautiful flowers throughout the long winter months. Frames shipped complete, ready to put together. Quickly assembled, easily ventilated. Built of the same materials as the large ranges of glass which we erect in all parts of the country. Make winter gardening a continual source of pleasure and profit. We manufacture 2, 3 and 4 sash frames, single and double glazed, besides the specials listed below. Complete planting instructions with each frame. Prompt shipment and satisfaction guaranteed. Send your order today. Portable Greenhouses complete from $185.00 up,

Special No. 3 Diminutive Greenhouse

Covers 40 sq. ft. of garden space. Probably high enough to receive some of your tallest pet plants. Six large lights of extra heavy glass to each sash. Hinged at top. Easily ventilated, strongly made. Nicely finished, quickly put together. Portable. Carefully packed. Price complete. Freight prepaid anywhere in U. S., $20.00. For double glazing, $2.50 extra.

PRICE DELIVERED **$20.00**

Our free catalog sent immediately for the asking. Write for it today.

Special No. 2 Beginner's Garden

To meet popular demand, we manufacture this special sash and frame. It's 8 ft. 4 in. long and just wide enough to put in a 3 ft. space. Sash has six large lights of extra heavy glass so that plants receive the maximum of life-giving sunlight. Carefully packed, easily set up. Price complete, freight paid anywhere in U. S., $10.50. For double glazing, $1.00 extra. Order yours today.

PRICE DELIVERED **$10.50**

MOVE EASIER
LIFT MORE
NEVER BALK

The Louden Litter Carrier

THIS MAN TELLS WHY HE PREFERS LOUDEN CARRIERS

117

will enable you to pick up the manure at each stall and convey it direct to the manure pit or to the spreader, without any hard lifting or pushing. A light pull on the hand chain will raise or lower the carrier to height desired, and it will stand firmly at any elevation, empty or loaded; has no trouble-making ratchets, brakes or clutches. Has the most powerful lifting gear of any carrier and moves easily on roller-bearing trolley.

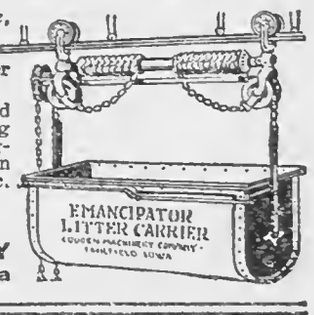
E. J. BECKWITH, of Lisbon, Mich., writes: "I like the Louden Litter Carrier for the following reasons: 1st, it is easy to install; I did it myself. 2nd, because it has strength and durability. 3rd, no other carrier would work on the short turns in my barn. 4th, the bearings rest on the track at two points, and the strain is less. 5th, in turning corners it works same as bobs going over mounds—the carrier makes the turns gradually and saves both the jerks and the strain on track."

No matter how small or what kind of barn you have, you'll find the Louden Carriers a profitable investment—they will pay for themselves over and over in labor and time saved.

We will send you sketches and suggestions free, for your new barn or remodeling your old one, if you will write us what size and kind of barn you need, also how many cows and other stock you wish to care for.

The Louden Line includes also Steel Stalls and Stanchions, Maternity Pens, Bull, Calf and Pig Pens, Alignment and Go-Right devices, Spring-balanced Mangers and Manger Partitions, Barn Door Hangers, Hay Tools, Power Hoists, Etc.

Write us for free illustrated catalog, or see your dealer.



LOUDEN MACHINERY COMPANY
2005 Briggs Avenue, Fairfield, Iowa

157 Willow Street, New Haven, Conn.

EVENTS OF THE WEEK.

DOMESTIC.—Wallace Smith, a young white lad, while roaming around the shops of the Gulf and Ship Island road, at Gulfport, Miss., Oct. 16, felt thirsty and proceeded to what he thought was a hydrant and a hose attached. The liquid he received instead of being water was compressed air. His front teeth were blown down his throat and his arm was broken by the force of the rushing air.

Pressure on the banks forced the bottom of the Culebra Cut, Panama Canal, up about 24 feet, Oct. 14. This upheaval has blocked the use of the canal by all vessels having a draught of more than 15 feet. Dredges are at work removing the obstruction. Seven ships were waiting for passage through the canal and the delay will affect at least sixty more vessels.

While feeling her way through a thick mist off Sandy Hook just after entering the Ambrose Channel, entering New York Harbor, Oct. 15, the United Fruit steamship Metapan, from the Caribbean, was rammed by the American-Hawaiian freighter Iowan, bound out. She was immediately run aground by her skipper, Capt. Spencer, on the north side of the great fairway to save her from foundering with her passengers and a rich cargo, including half a million in gold bars. None of the passengers or crew was hurt.

A swindle, by which women in the poorer sections of New York City have been duped into buying worthless furniture, has been disclosed by District Attorney Whitman, following the arrest of six men, said to be associated with the Grand Rapids Distributing Company, at 120 West 18th St., and the Empire Home Furnishing Company, at 241 West 23d. The men are charged with having sent out agents, who are alleged to have induced women to subscribe to a so-called furniture club, each member to pay 25 cents a week for a period not to exceed seventy weeks. The membership of the club was not to exceed 70, and each week one member of the club was to receive an article of furniture valued at $17.50, after which the lucky one was exempt from further payments. During the first few weeks, it is alleged, several influential women in the neighborhood would receive handsome prizes, and by this means other women would be induced to form clubs. It is alleged further that after making their full payments the women went to the company and were offered articles of furniture of insignificant valne. An examination of the books of the concerns, made by Assistant District Attorneys Colnon, Heilborn and Loening shows, it is said that the daily receipts of one of the companies averaged $400, which meant more than nine thousand outstanding contracts. The examination further established, it is said, that the proprietors are likewise proprietors of similar concerns, operating the same business under different names.

The New Haven Railroad's year long negotiation with the Department of Justice to set itself in order before the law came to an end, Oct. 17, when Judge Mayer in the United States District Court signed the dissolution decree that had been agreed upon by the New Haven and the Government. Under the decree the New Haven and the New England Navigation Company will dispose of properties carried at a book value of $134,000,000.

After 48 hours' imprisonment in quicksand 25 feet below the surface of the earth, Maurice Allen was rescued at Ware, Mass., Oct. 19, by a gang of firemen, policeman and citizens, who dug a ditch 50 feet long and 30 feet deep to reach him. Allen was boring a well when he struck quicksand and sank. All attempts at rescue by ladders and ropes failed owing to earth slides. An improvised diver's helmet made from a barrel was lowered into the hole and the man was supplied with air by a pump. Food and stimulants were fed to him through a tube.

Ten thousand dollars reward has been offered by the Lackawanna Railroad for the arrest of train wreckers who ditched the Manhattan flyer near Fulton, N. Y., Oct. 17, killing the fireman and fatally injuring three other members of the crew and cutting and bruising 15 passengers. A series of depredations in Fulton during the last month has caused District Attorney Culkin, of Oswego County, to believe that the spiking of the switch causing the wreck was the deed of a Black Hand organization.

Two persons are dead, several are dying in the hospitals and others were buried in wreckage as the result of the explosion of a bomb or an accumulation of dynamite in a string of tenement houses in Frontenac St., Montreal, Oct. 20. The majority of the tenants were Austrians and Russians. The authorities believe that the explosion was caused by race prejudice and a desire for revenge inspired by the European War. The police hold the same theory and are detaining 13 prisoners.

Great Britain has seized three American oil ships, the Brindilla, the John D. Rockefeller and the Platuria, all bound for neutral ports. All three belong to the Standard Oil Company. This action is to prevent Germany from getting fuel for her Zeppelins and aeroplanes. The British maintain that the shipments of oil to Danish ports are in reality destined for German points and therefore will not be permitted to proceed. Great Britain recently has made an arrangement with the United States whereby American shippers are to enjoy their usual access to the markets of Holland, Sweden and Denmark, provided these neutral countries prohibit the exportation of contraband of war to Germany. If the British suspicions continue to be acted upon these markets will be at least partially closed to American shippers of contraband and conditional contraband. The State Department is taking action on these seizures.

FARM AND GARDEN.—Poultry week at the Maryland Agricultural College, forming a part of the short course, is announced for January 18-23, 1915. There will be many interesting lectures and demonstrations.

The tenth annual show, of the Dover Poultry, Pigeon and Pet Stock Association, will be held at Dover, N. J., November 23 to 28. In conjunction with this the Ancona Club of America will hold its annual State meet.

Proceedings against an alleged "egg-trust" began, Oct. 22, in the office of the Attorney General at 299 Broadway, New York. The action, which has been instituted by James A. Parsons, Attorney General, is directed against the New York Mercantile Exchange and cold storage and packing houses. Edward R. O'Malley, of Buffalo, former Attorney General, will act as referee. Franklin Kennedy, Deputy Attorney General, will present the State's case. Attorney General Parsons asserts that the Mercantile Exchange, whose membership is largely made up of butter and egg dealers, has entered into an agreement with cold storage warehouses which constitutes restraint of trade. He further alleges that the exchange is violating the spirit of the agreement under which, two years ago, District Attorney Whitman did not press a John Doe inquiry to a conclusion upon the understanding that the exchange would cease to post quotations.

THE EUROPEAN WAR.—The British scout cruiser Hawke was destroyed in the North Sea, Oct. 15, by a German submarine with a loss of 400 men. Oct. 17 the British light cruiser Undaunted, aided by the destroyers Leunox, Lance, Legion and Loyal, sank four German destroyers off the Dutch coast. Oct. 19 the Undaunted captured a German mine layer.....The German cruiser Emden is still active in the Indian Ocean, recent operations including four British vessels sunk and one captured. It is estimated that the Emden has destroyed $10,000,000 in British shipping, apart from loss of trade.....Berlin reported that the new British submarine E-3 was sunk by German warships in the North Sea Oct. 18.....The Germans occupied Ostend Oct. 16. During severe fighting on the coast the Allies' left was reënforced by a British fleet, which was able to operate on the coast and in canals, coöperating with the Belgians between Nieuport and Dixmude..... The line of battle, Oct. 21, was 360 miles long, from the Straits of Dover through Belgium and France to Belfort. Severe fighting existed at many points but the Germans had not succeeded, Oct. 22, in breaking through the Allies' lines..... Oct. 16 a German factory in a London suburb was raided by the police. It was a concrete building of great strength with exceptionally heavy foundations. A similar building at Edinburgh, Scotland, was seized Oct. 17. In each case the factory occupied a strategic point, and was to all intent a fort. Similar factories have been reported in Belgium; at Maubeuge heavy concrete foundations in a German factory supported the German siege guns. The discovery of these fortress fetories has caused rioting in England, and the government is ordering all "alien enemies" to leave the country .....Both the Russians and the Austrians claim advantages at Przemysl, Oct. 20. The Russians report that they have taken the outer forts, the Austrians that they have gained one of the forts that was formerly captured by the Russians. The Austrians say that in Russian Poland the combined Austrian and German cavalry repulsed a Russian attack west of Warsaw. A report from Petrograd says the fighting on the Vistula continues without any marked advantage in favor of either force..... The Russian government reported, Oct. 17, that owing to the sowing of mines in German waters and the presence of German submarines, it would be compelled to sow mines in the Gulf of Finland and Gulf of Riga.....Rebel forces in South Africa were defeated by Union soldiers, Oct. 15.———Japan has seized, for strategic purposes, important islands in the Marianne or Ladrone, Marshall, East Caroline and West Caroline archipelagos. One Japanese warship was wrecked at Kiao-chow, presumably by a German torpedo boat.....The Russian government has announced its permanent withdrawal from the manufacture and sale of alcoholic drinks, which began with the war. The "Novoe Vremya" cites as a happy effect of the suppression of the sale of liquor an increase in savings bank deposits during September of 23,000,000 roubles ($11,500,000) over the same month last year, in spite of the war.

NEW YORK STATE NEWS.

EDUCATION DEPARTMENT BULLETIN.—The State Department of Education has set forth in a bulletin just issued its purpose to improve our rural schools and urges the adoption of the township as the administrative unit in taxation instead of the present school district. It also urges the better qualification of teachers, and that the rural schools must be maintained for a period of time equal to the schedule maintained in the cities. The courses of study in rural schools must, it says, be adapted to the conditions of rural life, and the school buildings, grounds and equipment must be as adequate and as attractive as those of the city. On the consolidation of schools in weak districts, the bulletin goes on to say that there are 1,400 school districts having an assessed valuation of $20,000 or less. There are 4,000 districts with an assessed valuation of $40,000 or less. This means that each of these 4,000 districts must depend for its financial support on 10 farms with an average value of $4,000. In about one-half these districts the average daily attendance is less than 10. Dr. Finegan states it as his belief that the improvements that should be made in our rural schools cannot be made until the township is made the administrative unit, and until that can be accomplished the weak school districts must be consolidated as authorized by the law of 1913. Within the next few years these districts should be reduced from 10,500 to less than 5,000. The bulletin also discusses the desirability of taking city schools out of municipal politics.

WEIGHTS AND MEASURES.—Delegates from all over the country will attend the convention of weights and measures' commissioners to be held in New York on October 29 to 31. A matter that will come up for discussion is the Federal regulation of weights and measures, in accordance with the Ashbrook bill now pending in Congress. This bill gives full authority in fixing and enforcing standards of weights and measures throughout the United States. The convention will also discuss the various types of weighing and measuring devices which the bureau of standards ought to select as mandatory throughout the United States should Congress enact the Ashbrook bill.

NEW FARM BUREAU PLANNED.—The Chamber of Commerce of Glens Falls and the local Granges are co-operating in an effort to have a Farm Bureau established in Warren County. A public market for Glens Falls is also being considered. The idea of extending the school gardens to the district schools is also under consideration.

BOYS WIN POTATO PRIZES.—Last Spring County Agent Barlow, of Otsego County, offered prizes for the best crop of potatoes raised by boys from 25 potatoes planted in 100 hills. The results are now known and George E. Cummings of Milford won the first prize, a thoroughbred bull calf, and Howard Van Scoy of Gilbertsville took second prize, a trio of White Leghorn fowls. Cummings planted the White Mountain variety and raised 571 pounds, his best hill yielding 54 salable potatoes weighing 34 pounds. Van Scoy had 492 pounds, his best hill yielding 38 pounds.

CORNELL WINTER COURSES.—This year the Winter courses in the State Agricultural College will begin on November 10 and will close February 12, 1915. The course is open to all students who have been graduated from a common school or have received an eighth grade certificate, and who are at least 18 years of age. Tuition is free to residents of this State. Last Winter there were more than 550 enrolled in these courses, and that number is likely to be surpassed this year.

BIG CHEESE FOR EXHIBITION.—The monster cheese to be exhibited at the Panama-Pacific Exposition has just been made at the West Martinsburg factory, in this State, under the direction of the cheese expert, Mr. H. A. Reese. The cheese will weigh between five and six tons, or two tons more than any turned out heretofore. It required 100,000 pounds of milk, the output of 25 factories for a day. It will be kept in the factory until January, when it will be started on its way to the Exposition. J. W. D.

Oct. 17. Apples very plentiful, good quality from $1 to $1.50 per barrel, some asking $2. Potatoes some sales; good crop; many holding for higher prices; going price 50 to 60. Butter, dairy, about 32 to 35. Hay from $12 to $20, quite plenty. Cabbage, beets, etc., reasonable. Cabbage about $1 per dozen; beets 60 cents a bushel. Cows are not plentiful, particularly new milch; there is a long range of prices from $40 to $80 or $90 each. G. A. S.
Center Harbor, N. H.

Fifty Daffodils For a Dollar

All extra good bulbs which will give many beautiful golden yellow flowers next spring if planted in the garden before the ground freezes. Daffodils will bloom for several seasons, which makes them specially good for garden culture.

These Fifty Daffodil Bulbs, All Extra Choice, will be sent anywhere for $1.00

We have a fairly good supply, but advise ordering early if you want to secure bulbs at this special price.

Our catalogue is ready. Send for a copy and see our list of Hyacinths, Tulips, Crocus and other Bulbs for fall planting and spring blooming.

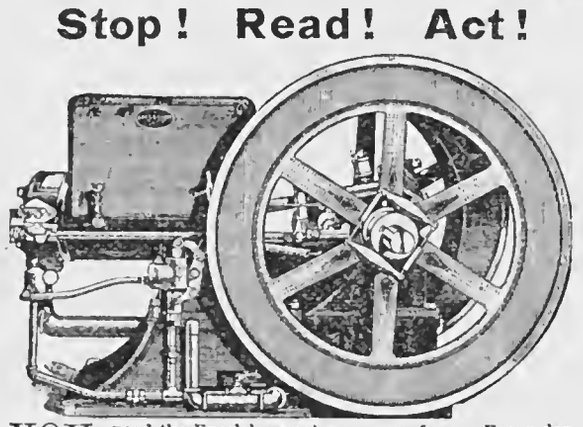
Mr. Business Farmer Stop! Read! Act!



YOU need the Excelsior engine on your farm. Every day you go without it you are losing money. You do not have to take our word for it. Order an engine subject to satisfaction. If you do not find it is the best engine and the biggest money-maker you ever saw, send it back to us. If after trial, you find it is the best engine you ever used, keep it. You can pay all cash or half cash and the balance in notes covering one year. You do not have to pay a penny in advance; you do not have to sign any notes until you are sure that the engine is everything we claim. If you will tell us the size engine you want and when you want it, also the size of your farm, we will make you an interesting proposition, something that will save you money. Send today for catalog and other information.

Do Not Delay. Act Now.

Black Wall Map of the World

The World and the United States At A Glance

A Great Education
At Your Fingers' Tips

This beautiful Wall Map, size 25x39 inches. On one side we have a complete, up-to-the-minute map of the United States in bright colors, showing the Capitols, Railroads, Rivers, large cities, etc. It also shows portraits of our 27 Presidents, and gives their biographies.

On the reverse side we have a map of the world, printed in a deep, ebony black. White and colored lines differentiate countries, rivers, lakes, cities and mountains. You never saw a map as black, as beautiful, as wonderfully enlightening as this map of the world. From this you may in a single day learn more than you could in a year's study of books.

Contrasting with the ebony black of the map are the flags and the coat-of-arms of all nations, in their flashy, exquisite colors. Our own seventeen flags are here in beautiful, bright colors—did you know that the United States had seventeen different flags?

And then, there's that wonderful Bible information. How many books, chapters, verses, words, letters does the Bible contain? How many books are classified as History, Poetry, Law, Prophecy, Epistles? Which books are exactly alike? How many times is the name of our Saviour mentioned? In how many languages is our Bible published?

Wouldn't you want to know these things? And wouldn't you want to know the many, many other things this marvelous Map of Knowledge possesses?

The Map will be sent, postpaid, for One New Yearly Subscription, or Twenty 10-Week Trial Subscriptions, or Two Yearly Renewal Subscriptions.

The Rural New-Yorker, 333 West 30th St., N. Y.

Don't Neglect Fall Spraying **"SCALECIDE"** Modern Methods Demand It

TRADE MARK REG. U. S. PAT. OFF.

It pays to get in fall spraying whenever possible. There is danger in waiting for spring spraying. "Scalecide" is better than any other dormant spray, either for insects or fungi.

Costs no more than lime-sulphur or the less effective mixtures. Our booklet "Scalecide, The Tree Saver" mailed free. B. G. Pratt Co., Dept. "N", 50 Church St., N. Y. City.

The Home Acre

CABBAGE AND TOMATOES.

A DELAWARE reader writes: "I have been reading your garden notes, and would like to ask your opinion of certain varieties of cabbages and tomatoes. I want a good sized cabbage to come in right after the Early Jersey Wakefield. Will the Succession do this? How about the Copenhagen Market and the Early Flat Dutch? Also tell us about tomato varieties and their respective earliness, such as John Baer, Marketer, Brimer, Crimson Cushion, Globe and Magnus."

For a cabbage of good size to follow immediately after the Early Wakefield there is none better than the Copenhagen Market. I have found that this variety is no good for Fall sowing here, as the plants run to seed badly. But sown in frames in Winter it grows and heads finely, and comes in about the same time as the Charleston Wakefield, and is larger. Succession is later and makes fine heads here in late July and August. The heads are the general shape of a drumhead. For late Summer and early Autumn I like the Eottler's Improved Brunswick. It makes large heads on very short stems and I prefer it to the Early Flat Dutch. The heads are fuller, round and not quite so flat as the Flat Dutch, and it is the most uniformly heading of any Fall cabbage I have grown. I formerly grew the Winningstadt as a succession to Early Wakefield, but the Copenhagen Market is better. For a Winter cabbage I have not found any better than a good strain of the Late Flat Dutch.

Now as to tomatoes, I have already given my opinion of the John Baer. It is a good, smooth and productive tomato, not early this season here as was claimed for it, but the dry season may have had something to do with this, though the Earliana ripened as usual and was 10 days earlier than the John Baer, which looks too much like Chalk's Jewel to be distinct. Marketer I do not know and have never grown it. Brimmer seems to be a good selection from the Ponderosa, and like all extra large tomatoes, does not make a large crop of fruits. It has a good deal of hard core. Crimson Cushion is a red Ponderosa, and one of the best very large tomatoes. Globe in my experience is the best of all the pink tomatoes. It is a very productive variety, fruit of fair size and solid, with very little hard core. Magnus is also a good tomato, and has the advantage of heavy foliage to protect the fruit from sunscald. It is not early, but is good and smooth. Maule's Success is one of the best main crop tomatoes, bright red, smooth, solid and produces fruit of good size and quality. Our growers here for the canners stick to the Stone, and when this is from a good strain there are few tomatoes of the main crop equal to it. The Delaware Station reports that Greater Baltimore made a heavier crop for canning. I have found no extra early tomato equal to the Langdon strain of Earliana, and Bonnie Best is a close succession and better quality. For a good succession I would grow for red tomatoes Earliana, Bonnie Best, and Success or Stone, and for a pink tomato the Globe. I have always had a passion for testing tomatoes from the time when I paid Col. Waring $5 for 20 seeds of the Trophy. Up to that time the Tilden had been the best smooth tomato. But it lacked meatiness and solidity, and the Trophy was the first effort to get the old ridgy Mammoth Chihuahua inside a smooth skin. I got the 20 seeds of the Trophy early in January and sowed them at once in my greenhouse, and as fast as they grew made cuttings and rooted them, and by Spring I had 150 plants and sold 18 of them for 50 cents each, and set out plants that made me $50 worth of seed, so that the $5 was well invested. This expensive propagation often pays very well with new things. Many years ago, when the Herstine raspberry was introduced, a neighbor bought in the Fall two large field-grown plants for which he had paid $5. I told him that I would propagate them for one-half and he left them with me. I cut the long roots into small pieces and sowed them in a flat in the greenhouse, and as fast as they sprouted potted them into three-inch pots. In the Spring my friend was astonished when I gave him 127 plants in pots with tops over a foot tall. This would hardly pay with plants at ordinary prices, but with new and high-priced plants it pays to do some intensive propagation. W. F. MASSEY.

Maryland.

Crab Grass in Lawn.

WHAT can I do to overcome crab grass in lawn? Last Spring I sowed grass seed, but the crab grass smothered my lawn seed out. I keep it cut down, so it will not go to seed. Would it be advisable to sow Timothy and clover this Fall, and work some lawn grass seed in it, and then next Fall sow more lawn seed? G. F. H.

Maple Shade, N. J.

It is no uncommon thing for new-made lawns to be smothered by a heavy growth of crab grass, and in such cases the entire lawn will have to be seeded over again to lawn grass. I have had several experiences of this kind, but instead of plowing or spading the ground again, as is most usually advised by grass experts, I pursued just the opposite course with good success. Crab grass is an annual, and dies down shortly after seed ripening time, which is during the month of October, but on account of its large root system it cannot be pulled out except with much difficulty in the Fall, but if left until Spring the old stems and roots can be raked off with a steel garden rake quite easily. This should be done early in April. After the lawn has been cleared of this rubbish, and the surface becomes dry enough to crumble, sow the grass seed broadcast and in the same quantity as for a newly-made lawn, and use a sharp spike-tooth harrow with the teeth pointing to the rear at an angle of about 45 degrees. Go over the lawn both ways with this, at least twice each way, then roll with a hand or a light one-horse roller, then wait for results, which I would be almost willing to guarantee will prove entirely satisfactory. Do not sow any Timothy nor Red clover on the lawn; neither of these is suitable for lawn purposes. You will probably have more or less crab grass in your lawn in the years to come and will also have to re-seed spots here and there almost every year, but do not let that worry nor discourage you, for it is a common occurrence everywhere that crab grass is abundant, and everybody is troubled in the same way in sections of the country where it grows at all plentifully. K.

LITTLE Paulina came in, bringing a scratched finger for salve and sympathy. "I cut it on the cat," she explained.—Judge.

Storing Vegetables for Winter.

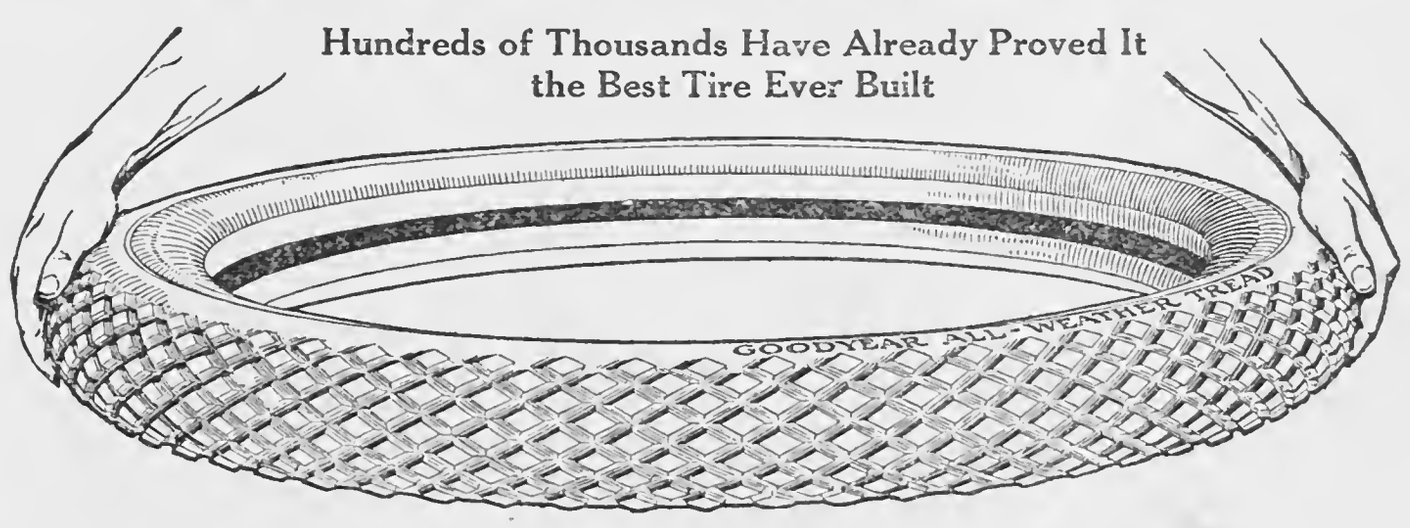
NOW is the time to consider storing vegetables for Winter use. Onions and squash should be placed where there is sufficient heat and dryness to prevent any possible decay; a heated room or warm attic will do. Parsnips, carrots, beets, salsify and turnips are best buried in soil. A good sandy loam is excellent. Place a layer of soil in the bottom of a barrel or box, then a layer of the roots, a layer of soil, a layer of roots and so on. Another good way where there are more roots to be stored is to pile the vegetables in conical form, place straw over them, cover with dirt, and as the weather becomes colder, add either dirt or manure.

Cabbages may be stored in a hotbed pit, if protection from over supply of water is afforded by covering the tops of the beds with boards and tarred paper. Protection should also be given against excessive cold by applying refuse over the tarred paper. Cabbages may be stored by spreading straw on the ground, removing cabbages, roots and all, from their location, and placing them head downward in the straw. Place them four wide, and on these another layer three plants wide, and place straw and soil over them. This will cause them to keep in the very best condition, especially on well-drained locations. The whole aim of storing vegetables is to prevent sudden thawing and freezing, to afford sufficient ventilation so the product will keep well, and to supply moisture to prevent shrinkage, while in the case of the squashes and onions, heat enough is given to prevent excessive moisture.

Here's the Safe Tire

The Strong and Sturdy Trouble-Saver to Which You Are Bound to Come

Hundreds of Thousands Have Already Proved It the Best Tire Ever Built



Get Goodyears Now

Now—for fall and winter driving—is the time when Goodyear tires mean most.

On these tires alone come these All-Weather treads. They are tough and double-thick, resisting puncture and wear to the limit.

They are flat and regular, so they run like a plain tread. Yet they grasp wet roads with hundreds of deep, sharp, resistless grips.

For safety's sake—if for nothing else—every wheel should now be equipped with these ideal anti-skids.

You want to minimize blow-outs. We do that, at an extra cost of $1,500 daily, by our exclusive "On-Air" cure.

You want to combat loose treads. By a patent method—used in Goodyears alone—we reduce this risk 60 per cent.

No other tire employs one of these ways to combat your chief tire troubles.

Say You Want Them

The way to get Goodyears is to say that you want them. Any dealer will supply you. These are the ruling tires. They have won more users than any other tire. It is time that you know them. And now—when your tires face the year's hardest usage—is the time to find them out.

For your own sake, do it.

Your Other Needs

You also want a tire that can't rim-cut. That means the Goodyear No-Rim-Cut tire.

THE TALE OF A TOOTH.

INTRODUCTION.—It is my tooth, and I am largely responsible for its condition. It has had a long and varied experience, and its story may be said to carry both moral and evil. The dentist might describe it as an upper left hand canine. To me it is an eye tooth gone to the dogs. Why not let such teeth rest in oblivion? I think it has a message to humanity—along with the poet or the statesman. There should be a motive for every story. The other day I saw a young man cracking walnuts with his teeth and betting that he could crack hickories in the same way. Another young fellow with decay starting in his teeth spent the money which should have employed a dentist in paying for some midnight suppers. I met a woman of 25 who has lost all her teeth and must now chew on through life with plates. Perhaps the tale of this tooth may startle some careless young person into the warfare against pyorrhea and other allies against the gums and teeth. The old one-legged veteran by the fire never could convince us children that the pen is mightier than the sword, but perhaps my dilapidated canine may indicate the power of the toothbrush!

YOUTH.—This eye tooth grew along with the rest of the set. It is said that in some families nearly all members show poor teeth—due to naturally "imperfect enamel" and poor food and water. Brown bread or cornmeal bread and other foods low in lime with soft water and potatoes made up a good share of our diet as children. I think that gave our teeth a poor start, and yet I have seen the negroes at the South—living mostly on corn bread and pork—with perfect, dazzling white teeth. At any rate my children now have food which I know is rich in lime and phosphorns. By the time my second teeth came on some of them seemed ready for pulling. The local dentist was known as "Snake 'em-out Thomas." He had a strong arm and lived up to his reputation. He got out a couple of mine and cast his eye on this "canine," but finally let it go. At that time, as I remember it, the great majority of people of 40 or over had lost their teeth. The dentists did not try to save teeth as they do now. They pulled them out and comforted you with the information that Geo. Washington "wore" a set of teeth carved out of a solid block of ivory! It must have been very consoling. People [illegible]ed to accept the loss of their teeth with philosophy. It was a regular part of nature—like having the hair turn color. Most people seemed to be rather proud of their plates!

BEGINNING EARLY.—My "upper canine" began to growl before I got my growth. My children are taught to consider their toothbrush as necessary as knife and fork. Both the old people who brought me up had lost their teeth years before, and accepted the situation. When a man accepts the situation he is not a first-class teacher. I was taught that children should eat the hard crusts of brown bread—the chewing of these tough morsels would clean the teeth! It is much the same proposition as feeding ear corn to horses as a remedy for lampas or a growth on the teeth. I nearly broke my young teeth on that hard crust, and there was not lime enough in it to make solid bone. Then I went to Boston as errand boy in a big store, and the teeth lacked even this brown bread crust care. One day I stopped to listen to a faker on a street corner. He had some wonderful powder for cleaning the teeth. "Now," he said, "here's a young lad!" and before I knew it he had me up on a box with my mouth open cleaning my teeth with his powder. He did make them shine, but I am satisfied that his stuff started my canine along the way to the bark which largely destroyed its bite. No more playing the part of "object lesson" for me. My tooth began to fail. There was a little pain at drinking ice water or hot coffee, and small black holes appeared. I would have my children's teeth looked over twice a year, but in those days somehow we just let them go. Finally I decided to go to Colorado to try my fortune at cattle herding. An old friend out there wrote this practical message—"Get your teeth fixed before you start—you will have to chew salt pork and leather cakes here."

FINANCING IT.—So I went to a dentist. He looked in my mouth and shook his head. "You ought to have come two years ago," he said. However, he pulled out a couple and began on the others. That was in the good old days when the dentist worked a pedal with his foot to drill out the tooth. Two old soldiers sat about and watched the work telling how it was done in the army. The old dentist did a good job, and packed a chunk of gold into my canine. Unhappily I made no bargain before we started, and I had no idea what the job would cost. When we were done I thought it might perhaps be $15. You can imagine my feelings when the old dentist handed me a bill for $60. I am told now that expert New York dentists would charge $200 for the job, but that would not relieve a moneyless young man. Well, I couldn't pay it; I told the old dentist so. He sat down in his chair and looked at me for about five minutes. I expected he would call in a policeman and set my teeth on edge. Instead of that he said slowly and kindly:

"I am going to trust you. I think you are honest, and I don't think you tried to beat me. You can't give back my work as you could a suit of clothes. You are going 2,000 miles away, and probably will never come back, but I think you will pay that money and I shall trust you to do it. Good bye and good luck to you!"

That was in March. By August I had saved $60 out of my wages. I rode into the little Colorado town with that money in my pocket. The bank was in the same block with a clothing store. I needed clothes and many other things, and I confess that I went past the bank and got inside the store. It was easy to argue that this old dentist never could get at me far out on the plains. He was probably rich anyway, and did not need this money, while I did. Let him go! A minister to whom I once told this story said that "the old devil" was right there on the sidewalk telling me this. I did not see him, but I did feel like him.

Then came the other side. This man trusted you, and put it up to you squarely as a matter of honor and character. Have you anything of either quality? If so you have got to show it now or quit forever. All this was fought out over my tooth. Finally I went into the bank, bought a draft and paid the $60 to the old dentist. You see this old tooth of mine has had a varied experience and considerable influence. I think that decision to pay the bill was the best financial move I ever made. It was the foundation of saving and meeting obligations so as to obtain credit. Do you wonder that I stay by my old friend the canine tooth?

TINKERING.—The old dentist saved that tooth, and his gold held in place, and I enjoyed the "salt pork and leather cakes." But while the old dentist and the tooth taught me financial obligations, somehow they could not make me realize the fact that teeth need daily care. Tartar began to accumulate and pyorrhea appeared. This wasting away of the gums comes on as slowly as "near sight" or deafness. The young and vigorous think nothing of it until finally the fact is forced upon them that the teeth are becoming loose and that a little bare streak has appeared above the crown which "aches," with a pain which no remedy can subdue. Some of my teeth went that way, and when they start it is hard to hold them. While at college I worked one Winter in a lumber camp far from town. One big fellow in the midst of a bad storm, came down—or up as you please—with a jumping toothache. There was no remedy and this man had no use for a dentist except to pull teeth whenever they ached. There was an old fellow near by who "knocked out teeth," and in his desperation the sufferer went to him. I did not have the nerve to witness the operation, but the report was that three men held the "patient" while the operator put a small, sharp, cold chisel at the root of the upper tooth and tapped it with his hammer. They said the tooth dropped quickly out at a light blow! My own canine tooth began to ache in sympathy, but I thought so much of my old friend that I declined this sort of surgery and walked through the storm to town. There a dentist filed off the upper part of the tooth below the gum and put in cement. He meant well, but he hurt so with his few rude tools that he did not do a thorough job.

A REMEMBRANCE.—When I finished at college I started for the South. Waiting for a train in a little junction town I saw the name of a good old friend on a dental office. This man had studied dentistry and "hung out his shingle" in this little place. The shingle was accummulating more moss than money, but like all the rest of us in those days, my friend was as hopeful as a dream. He had more time than patients, so he got me into his chair. His proposition was that he could fix up a couple of my teeth and I could wear them as I would a ring or a jewel for remembrance. So while we talked over old days this man dug out the gold of the old dentist and the cement of the new one, bored a deeper hole and patched up my friend anew. It was a kindly and original thing to do for remembrance, and I went on my way with the "upper canine" not only carrying a financial lesson but one of sentiment and friendship as well. Of course I would stay by such an old friend. Every one of these men told me that I might have saved my teeth had I cared for them properly.

STILL ANOTHER.—In the South I picked up another good friend. Dentistry in that section could not be called an exact science. This man could not get his patients to come to him, so he went after them. He rode out over lonely roads through mud or dust, across rivers and swamps, with his dental kit in the saddle bags. He would stop at farmhouses and talk teeth-pulling or filling as times were good or bad. After the cotton was sold and money was plenty there would be more filling done. It was rough work, but this man did it well. My canine began to bark once more—this time above the gum. There was to be a great baseball match with some neighboring town, and it was one of the very rare occasions when my fellow citizens built their hopes on me, or on my arm. I was pitcher of the town club, and although a very poor vessel I held the water of hope for the town. And a few days before that great match my tooth went wrong. The trouble was up in the gum. You may know how the face puffs up—so painfully that it hurts you to think. My eye was nearly closed and life had lost its charm. Then my friend the dentist came to the rescue. I would not let him pull my old friend, for it was full of "Records which defy the tooth of time."

So he picked out my friend's "remembrance" filling, got up into the gum and relieved the swelling. Then to be sure he ground out a little more of the tooth and packed in a larger filling. And at the baseball game when I mowed down those batters with a curved ball my good friend the dentist danced for joy over by first base.

CRUMBLING.—Three other dentists have had a chance at this old tooth since then. Most of them have advised pulling it at times, but I have hung to it as I would to any old friend fallen upon evil days. Little by little it crumbled. The gum receded and a little crown was put on it—not, however, for the good it had done. Then it played the part of anchor with a wire to hold two other teeth firmly. It is wonderful how the modern dentist will fight for a tooth—and hold it in the jaw. There came a time after all this patching when my friend carried about as much cement as a fence post. There was no longer a cavity, but a little strip of enamel and a hole. "We will hang to it," said the dentist; "it helps!" So it did.

A SHOCK.—One night the blow fell. When I was a boy I knew a man with a very long nose who got up in the night. The room was pitch dark, and this man groped around for a light. The door stood open. The man with arms outstretched to feel his way walked into the edge of the open door. One hand passed on either side and he walked on until he bumped that long nose plump into the door. It was a standing joke that his nose was longer than his arms. I laughed with the rest and perhaps fate came back and marched me into retribution. At any rate I got up one dark night groping in that same way and passed the open door with my hands spread out. The edge of that door might easily have hit me on any one of 50 other places, but it landed fairly and squarely right on the point of my old friend the canine, and broke it off at the gum. It seemed to me for about five minutes that the end of the world had come. My old friend through trouble and joy would never bite again.

GRAFTING.—That would have been true 50 years ago, but it is not true now. "The root is strong," said the dentist, "we will graft in a new one!" So he proceeded to grind down the top of that root. The old dentist who started that tooth did his grinding by working a little machine with his foot. His leg soon gave out. The modern dentist put a tiny grindstone at the end of a wire, touched a button and the grinding was done by electric power. I never realized how hard a tooth really is until the fraction of an inch was ground off that root. It is not my job to tell how it was done, but it seemed to me that after grinding down the root the dentist bored a small hole into it and then put in a porcelain tooth with a stout pin at the top. After being nicely adjusted this was firmly cemented in so that now my old canine friend is stronger and more serviceable than at any time during the past five years! It is like the old tree at Hope Farm which we cut off and topworked. It is now far more vigorous and profitable than before. And so it happens that after over half a century of service, and after being given up by half a dozen experts, my old friend is still at work—a rooted witness to the wonders of modern dentistry. Yet there was no good reason why it should be a wonder, because if it could have received good care in its youth it might have grown on sound and useful without all this painful and varied experience. I wish it were possible to make our young people realize the folly or crime of disregarding their teeth. Very few of them thus neglected will stay by as my old friend has done. H. W. C.

THE BALDWIN CARBIDE LAMP
Generates and Burns Acetylene Gas

Makes night hunting and fishing greater sport than ever.
Throws a wide circle of light 150 feet on the darkest night. More powerful than electric light. Makes night driving, hunting or boating safe. Can be carried as a hand lantern or worn on the cap or belt, leaving both hands free. Fine for working about machinery, repairing punctures at night, hunting stray cattle, etc.

TRY THIS LAMP FOR TEN DAYS
Order a Baldwin from us or your dealer. Use it for ten days. If not entirely satisfied, return the lamp and we will refund your money. Your dealer is authorized to make the same arrangement with you.

FREE TO YOU
Send us your dealer's name and we will mail you our very instructive booklet, "Knots and How to Tie Them." You should have this. The illustrations show you how to tie many kinds of knots.

JOHN SIMMONS CO.
148 Leonard Street, - New York City

"THE DUPLEX"
DRIVING LAMP
Is made for *you*, so that you can observe the new Stato Law at the lowest possiblo cost.

1. It is small—9 inches over all.
2. Attached to either side of dash.
3. Strong white light ahead.
4. Strong red light to rear.
5. Cannot spring open.
6. Oil fount contained in case of lamp—cannot work loose or drop oil.
7. Burns kerosene.
8. Simple to light and keep clean.
9. Will not rattle or work loose.
10. Guaranteed not to blow or jar out.
11. No solder to melt.

Handsomely Made in Two Finishes
Retail Price, $1.50, (50c extra with optical lens).
Costs 50c to a dollar less than the old stylo lamp. Be sure to write us for copy of the New Law today—FREE.
EMBURY MANUFACTURING CO., WARSAW, N. Y.

SAVE HALF Your Paint Bills
By using INGERSOLL PAINT—proved best by 66 years' use. It will please you.
Only paint endorsed by the "Grange."
Made in all colors—for all purposes.

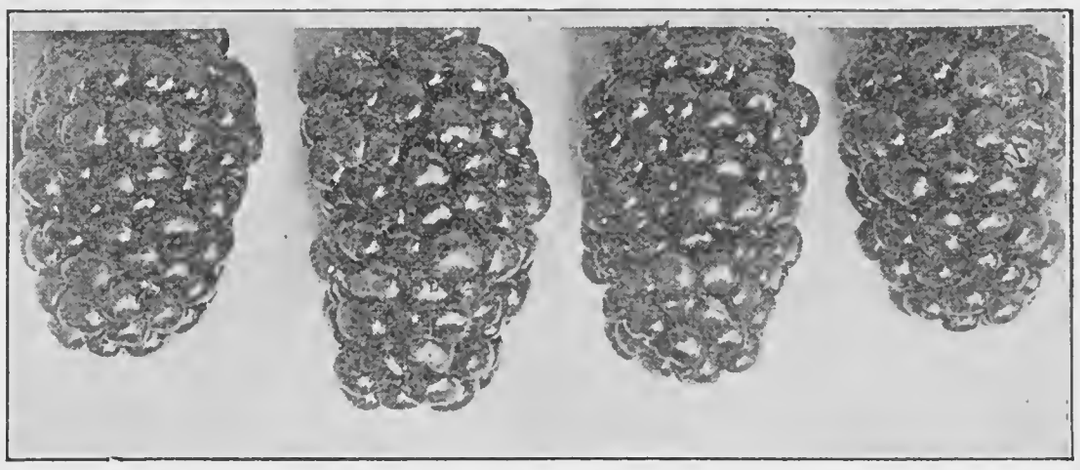
FRUIT NOTES FROM MISSOURI.

McDONALD BERRY.—I have spoken previously of the dewberry-blackberry hybrid from Texas, the McDonald, which I have had on trial. This Summer more than a hundred plants of this variety bore their first crop, and for the first time I was able to estimate its true value. As a result I feel that in the McDonald there has arisen the greatest of all the blackberry family, and that it stands alone in the possession of qualities that make it the most valuable of its group both as a market and family berry. In one point only is it open to criticism, it is not self-fertile in flower. The question of a suitable mate is not so easy to solve. In Texas it is planted with the Austin and other dewberries, and also with the blackberries standard there, the Sorsby and Dallas, but I believe it is only necessary to plant it with any self-fertile variety of its family which blooms at the same time. How far north the Sorsby and Dallas are hardy I cannot say, but probably not above the latitude of St. Louis. The Early Harvest is the standard extra early blackberry throughout the Middle and most of the Southern States, and should also prove to be a dependable pollenizer. But the McDonald begins to bloom before any other kind of blackberry or dewberry that I am acquainted with, and is the first of all its tribe to ripen fruit. Therefore its earliest berries are to some extent imperfect, but its blooming season, if very early, is also quite long, and this loss from defective berries is not worth considering. The McDonald is also the most productive of all, considering the size of its berries; its berries average larger than those of any other variety, and its berries grade as dewberries and therefore bring a considerably higher price than blackberries. It is an extremely vigorous grower, surpassing in this respect all our standard varieties. It has endured without injury 10 degrees below zero and is a true evergreen, holding its leaves green even at zero temperature.



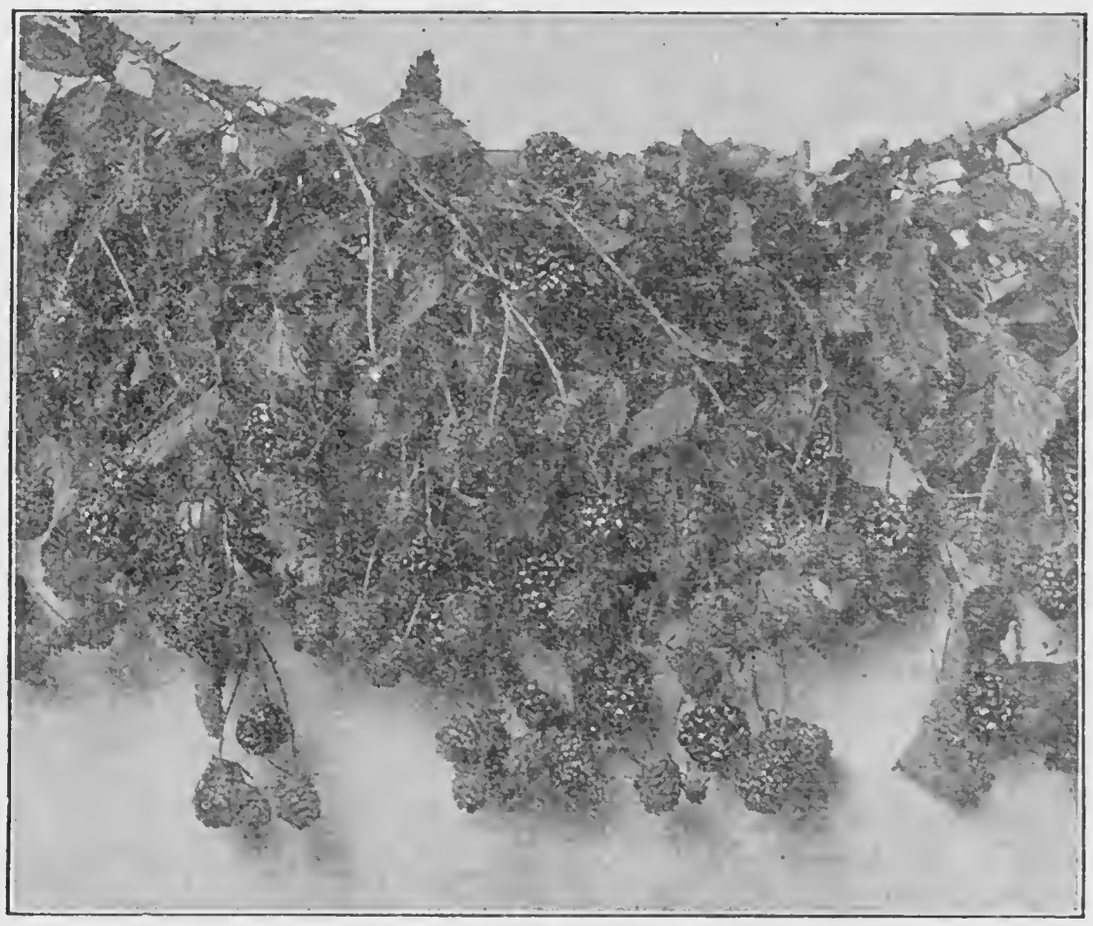
FRUIT OF McDONALD DEWBERRY-BLACKBERRY.

GROWTH AND CULTURE.—Minor points are that it roots readily from its tips. For the first year of growth it is a creeper, but after that sends up long, strong canes of great length; in the latter part of the season these canes put forth a mass of slender laterals which envelop the whole bush and reach on to the ground, where they take root at their tips. This habit of growth brings nearly all the berries on the outside and distributes them from top to bottom. It appears to be able to get along without any pruning, the new growth using the old wood as a frame over which to lie. Notwithstanding we had an all-Summer drought here, the McDonald brought its great crop to perfection, and then made its usual vigorous growth, its laterals forming during the hottest and driest part of the Summer. At this place, about latitute 37, McDonald berries were all sold by June 10. Early Harvest about half gone, Early King just ripening.

POST AND WIRE SUPPORT.—The way that I am growing the McDonald is to use posts and wire, placing two parallel wires about 18 inches apart and about five feet from the ground. Two others might, for the second year of growth, be placed about three feet from the ground. As the long main canes grow up through the former year's growth, they are trained up between the two wires so as to hold them erect. They are then carried to the right and left, but not more than six canes should be permitted to grow, and two canes may be better, depending on strength of soil. When the laterals start from these canes, they form a solid mass flowing down to the ground on each side of the wires. The rows should be not less than eight feet apart and 10 feet would not be at all excessive, and this distance would not suffice for a wagon to pass along. I am coming more and more to the opinion that the most satisfactory way to handle both blackberries and raspberries is to train the bushes on wires. I am already doing this with the blackcaps and shall add the reds and the blackberries as well. It is the only feasible way I can discover to keep the middles free and open for cultivation and picking and destroying such weeds as the morning glory.

L. R. JOHNSON.

Cape Girardeau Co., Mo.



A PROLIFIC CANE OF McDONALD.

PLANTING BULBS.

WILL you give some information on the Fall planting of a tulip bed, also Crocus and other bulbs? How should the bed be covered for very cold weather?

W. J. E.

Dillonvale, O.

Bulb planting should not be done while the soil is sticky from recent rain; a well-drained soil should be selected. Set early tulips five inches deep, and the same distance apart; the large late-flowering or May tulips need a little more room, and may be set six inches apart, and about the same depth. No fresh manure should be near the bulb. After the ground is first frozen for two or three inches deep it may have a light covering of spent manure or other litter, such as marsh hay or shredded cornstalks. If the litter is put on before the ground is frozen it makes a congenial home for field mice, which are extremely partial to tulip bulbs, and they always seem to choose the more expensive varieties for food. The mulch must be removed as soon as growth shows in early Spring, but if there is a sharp frost followed by snow or rain, the plants must be covered again, or the flower bud may be destroyed as it emerges. On large places, and in public parks, it is a common plan to lift the soil from a tulip bed to the proper depth for planting, set the bulbs on this uncovered floor, and then return the soil, spreading it over the bulbs.

Crocuses are set two inches deep, and prefer a sunny situation. Scillas (squills), though small bulbs, must be planted four or five inches deep; they prefer shade, and do well under trees. Snowdrops, grape hyacinths and glory-of-the-snow should be covered three to four times the depth of the bulb.

Narcissi are set at varying depths according to size; one rule is to cover them one and one-half times their own depth, measuring from the bottom of the bulb to the beginning of the "neck." This brings most of them about six inches deep; the small ones are set four or five inches apart, the large ones six or eight inches. Hyacinths are set six inches deep.

Bulb planting usually begins as soon as the leaves are all off the maples, and from then to hard frost, but the amateur planter rarely receives them much in advance of the time of planting, and Narcissi especially should be planted promptly. Some of the lilies are received earlier, especially Lilium candidum, which is ready for planting in August, and should make its preliminary rosette of leaves before Autumn.

Pruning Hybrid Roses.

WILL you tell me the proper way to prune the young wood of Hybrid Remontant roses? I have some seven feet high; some claim they should be cut back to about six inches above the ground to allow other shoots to start from this new stock. Others claim they should be cut back to about three feet through the Summer. In Spring I prune back to about one foot, but I do not know if it is right to allow new shoots or young wood to grow so long.

W. M. D.

The main pruning of Hybrid Remontant roses is done while they are dormant in early Spring, when they should be cut back to about six to eight inches. A moderate cutting back of long, unsightly canes may be done after the June flowering is over; this is to induce growth that will bear late flowers. Weak interfering shoots may be removed at this time, but no severe pruning such as is given the dormant plants. Late Summer pruning induces a growth that has little chance to ripen fully, and severe winter-killing may follow, especially if there is a late Fall with abundant moisture.

"My son Hiram is just crazy to go to college an' study pharmacy," said Mrs. Wheatly. "It may be all right," replied Mrs. Corntossel, "but I think th' place to study farmin' is right here on the farm, where ye git practical experience."—Livingston Lance.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. We use every possible precaution and admit the advertising of reliable houses only. But to make doubly sure, we will make good any loss to paid subscribers sustained by trusting any deliberate swindler, irresponsible advertisers or misleading advertisements in our columns, and any such swindler will be publicly exposed. We are also often called upon to adjust differences or mistakes between our subscribers and honest, responsible houses, whether advertisers or not. We willingly use our good offices to this end, but such cases should not be confused with dishonest transactions. We protect subscribers against rogues, but we will not be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and to identify it, you should mention THE RURAL NEW-YORKER when writing the advertiser.

I SEE that ex-Senator Eugene M. Travis is a candidate for Comptroller of New York. Is this the same Senator Travis who made such a fight against the bill to regulate commission men? D. S.

The same Senator Travis! While he was in the Senate, and after he failed to return, Mr. Travis was the leading spirit in the efforts to kill or cripple the commission man's bill. He sneered at farmers, ridiculed them, and told us personally that the biggest crooks in business were to be found among fruit-growers. At that time Mr. Travis kept his hat on in the presence of farmers. Now he takes it off and asks for their votes. What Mr. Travis fought hardest was the proposition to bond the commission men. As Comptroller he would be expected to pass on the sufficiency of these bonds. Travis the Senator with no farmers in his district, was one thing Travis the candidate is another. He has informed us that he is now highly in favor of the commission man's bill and considers it a fine piece of legislation. As is the case with many of us, his hindsight is very much superior to his foresight.

*

THAT is a pretty race in the egg contest between the English Wyandottes and the American Leghorns. This week the Leghorns are ahead, but the Wyandottes are pulling them down. With two weeks more to go it will be a close race. May the best birds win! Now we want to say something about this "Barron" stock. Mr. Barron's success at the egg contests has naturally created a demand for his birds, or for the blood of his leading strain. Our American poultrymen should remember that these English birds are quite different in type from the American specimens of the breeds. It is by no means sure that this Barron stock will be best to cross upon the American birds. Our own advice is not to make such a cross, but to breed the English stock pure—that is, to keep it separate from the American. These English birds are remarkably good layers, but they have been bred on different-lines from the American, and we would not mix the two. Again we give fair warning that some breeders may offer so-called "Barron" stock when they have nothing of the sort. Men may buy an English rooster and cross him with their hens, or buy a sitting of eggs and use the cockerels for breeding, and then advertise the true English stock. We would not advise the use of such birds for breeding. Use the pure strain of English stock without admixture of other blood, or do not touch it for breeding!

*

CHAS. S. WHITMAN, one of the candidates for Governor of New York State, is reported in up-State papers in opposition to the Land Bank as follows:

At the end of ten years, it is true, you have paid $1,350 (on a $1,000 mortgage)—paying $100 a year and the interest at 3½ per cent. But you have paid $135 the first year, $135 the second year, and so on until when the last year has arrived there is only $100 to pay and you have to pay the $135, or 35 per cent. interest. Altogether then the farmer has to pay seven per cent. interest on his loan instead of six per cent., as it was under the old system.

The trouble with the District Attorney of New York is that he knows nothing about the subject he is talking about. Any other conclusion would impeach his sincerity. He is talking about a 3½ per cent. mortgage for $1,000, to be paid in 10 equal annual installments; but he forgets that in such a case the second year's interest would be on $900; the third year on $800, and so on, until the last year, when he would pay interest only on $100. The farmer would simply save interest on his payments; and Mr. Whitman would have trouble to figure him out a seven per cent. rate in such a case.

But the Land Bank is not expected to loan at a 3½ per cent. rate in these times. That will probably come later. The Land Bank does not propose the kind of mortgage Mr. Whitman has in mind. A small percentage will be paid on the principal of the new mortgage in addition to the interest. The German rate is 4.3 per cent. If the Land Bank can loan at that rate, the borrower will pay $124.09 annually for 10 years, and his debt will then be wiped out. If he paid only $52.59 annually, including interest, he would be out of debt in 40 years. Mr. Whitman reasons on the Wall Street basis by which the lender gets the benefit of interest on the accumulations. The farmer gets the benefit of compound interest in the Land Bank system.

*

VOTE FOR WORTHY FARMERS.

WE consider it very important that intelligent farmers should have a fair share in making and administering the laws of New York. Farming is one of the greatest industries of the State, if not the most important. During the next few years great changes are coming to farming. New laws and new regulations will be needed, and hard battles must be fought to prevent encroachment upon our rights. In the last Assembly 18 members out of 150 professed to be farmers or fruit growers. Of the 51 Senators four were farmers and one claimed to be an "agriculturist." The farmers in the last Legislature were fully alive to the needs of farm legislation, and were of great help in pushing through the four great bills which are to mean so much in the future. Whenever you go to the Legislature with a needed measure which is to help farming you find the farmers in that Legislature anxious to help and more than willing to work. The situation has greatly changed in this respect during the past few years. The quality of the men who write "farmer" after their names is high, and they know how to work for agriculture, and are willing to do it. It is more than ever desirable that strong and intelligent farmers should be elected this year. There are many candidates. We cannot name them all, but as illustration of what we mean, take Senator Thomas B. Wilson, of Ontario County, or Albert Manning of Orange County. Mr. Wilson is one of the most useful members of the Senate, and he will go back with wider experience and stronger influence. Mr. Manning is secretary of the Dairymen's League, and he will stand for the rights of milk producers in particular and farmers in general. We might mention many others if space permitted, but in general we urge our readers to vote for those candidates who in addition to real character and intelligence, can honestly call themselves farmers, and who are in sympathy with farming. Another important thing this year is the election of delegates to the Constitutional convention. New York voters will be called upon to elect 15 delegates to this convention. Here again it is necessary to take care of the interests of farming. Under our present constitution there are several unsettled questions regarding the laws which are supposed to protect farmers. Some of these questions have not yet arisen, but they are sure to do so in the future, and this constitutional convention gives us a chance to settle them and escape a long controversy in the courts. We must have in that convention trained men not only farsighted enough to know what agriculture needs, but with the practical knowledge and sympathy which give men the courage and power to fight the battle for their people. THE R. N.-Y. would greatly like to see our present Commissioner of Agriculture, Calvin J. Huson, elected as a constitutional delegate. We would like to have his election made unanimous or nearly so in the rural counties. In such an event Mr. Huson could go to the convention so clearly the special representative of the farmers that he could command instant attention and carry great power. With such a backing the convention would recognize the fact at once that New York farmers were a unit in demanding constitutional rights for their business. THE R. N.-Y. does not attempt to offer political advice to its readers. They are intelligent men who can think for themselves. It is our judgment, however, that one of the wisest things our farmers can do this year is to give Mr. Huson a practically unanimous vote.

*

THOUGHTFUL people are now considering the future effect of this awful European war upon the industries and society of this country. It seems like a simple proposition that no matter how the war ends, this country must reap great material gain. Europe cannot lose the services of 6,000,000 men or face the destruction of billions of dollars' worth of property without calling upon this country to help feed and clothe her people. There seems no escape from the conclusion that for years to come the United States must supply Europe and South America. There is another side to this. What will be the effect of this war upon immigration? Shall we have new streams of immigrants from Belgium and a revival of German immigration, or will peace make new opportunities in Europe? Prof. Ross, of Wisconsin University, advances this novel prediction:

I now look for a rapid increase in the immigration of women—widowed, or otherwise bereaved by the war. This may have a serious and lasting influence upon the social position of woman in this country. Such an influx might break down barriers the trades unions have tried to maintain against the employment of women in "men's work!" From the standpoint of the employer, bereaved immigrant women, lashed by hard necessity, would be quite ideal strike breakers.

As is well known, the women in Germany and France have for years done "man's work" on the farm or in shops. During the present war European women are doing the work of home defenders, and should the war continue for several years much of this change of industrial society will become permanent through habit. Here then is a new thought and an entirely new problem for this country.

*

WE believe that this "Favorite Hen" entry at the egg-laying contest will prove one of the most attractive features yet introduced in this popular event. The hens are fair representatives of good utility farm stock. They do not come from "fancy" or high-pedigreed flocks, but have been developed under the care of intelligent farm women, with such resources as a good farm can provide. Thus these hens, taken from 30 widely scattered farms, will give us a fairer idea of the merits of the true American hen than either the picked representatives from leading hen farms or the "scrubs" or "culls" taken from the market. We expect a most interesting contest between these "favorite hens." We have long believed that some of these farm flocks, unknown to fame, contain hens of unusual laying ability. We expect this contest to demonstrate this belief. The poultry business has gained rapidly in importance since these contests were started. Society must look to the hen more and more for its food. In a report from Manila we are told that poultry are not bred for size or egg production as they are for fighting:

The fact that no Filipino of the common class regards himself equipped for living without at least one male chicken explains why the islands, although raising so many chickens, still import eggs. As in all cock fighting countries, the fighting bird in the Philippines is a personal pet which the owner carries about during practically every idle moment of the day, and on which he lavishes enough care to raise many laying hens.

While the Filipino trains his fighting bird and buys eggs the American will "swat the rooster" and take off his hat to the American hen! We hope that among these 30 Favorite Hens there may be found several capable of making a new egg record.

*

EFFORTS will be made to sell substances which are said to contain potash—such as "stone meal," mineral fertilizer and similar things. We warn our readers against an investment in any of these things until they have been analyzed and endorsed by the experiment stations. Pay no attention to the wild stories told about these things. The promoters will try to take advantage of the present shortage in potash to sell their stuff. Pay no attention to them—you will pay dearly for it if you do.

BREVITIES.

No frost yet on our hills.

IN attempting to dispose of this big apple crop, do not forget your own home market.

THE boom is coming in the hen business. Tie a stone to it for ballast. Do not let it all be gas.

THE latest suggestion for teeth cleaning is to eat a mellow apple after each meal. The apple as a toothbrush ought to appeal to fruit consumers.

IN 1913 Pennsylvania turned 6,702,449 tons of sand and gravel into glass and buildings. In the same year Missouri made $6,412,861 worth of clay products.

NOW WE have writers appearing who tell us that swamp muck will take the place of potash. Nonsense! The striking feature of muck is that it has little or no potash!

ONE scheme for encouraging the use of cotton is to handle flour in cotton sacks instead of the usual sack of jute. The problem is to find new uses for cotton and thus increase its sale.

THE public usually lines up into two sides on most public matters. We may call them the "pro" and the "anti." Can you tell us why the "anti" people are usually the more rabid and violent in their statements?

THE nursery business seems to be one of the many affected by the European War. At least some of the nurserymen begin to claim that they must have higher prices because some supplies are shut off. With very few exceptions American nurserymen can supply practically every demand from home-grown stock. Much that is usually imported can be grown here. It will require enterprise and effort to do it, but is feasible.

WOMAN AND HOME

A Plain Country Dinner

What It Cost in New York—New View of High Cost of Living

"LET us move to the city, Clara, I can earn $2.50 or $3 a day, and we ought to save some money. I am tired of this business of being tied to a cow's tail all the year around. Chores morning and night, and we never get anywhere, have to be here every day. We could economize in town and could see things, and it would be an easy job."

This is the way many country folk talk. Many have acted on the suggestion, have gone to the city, and are finding daily that dreams do not come true.

I don't forget some of those days when my mother was living. After church my wife and I would drive around to father's and mother's place, and we would have a fair country dinner. It would be no spread. My wife would put on my mother's apron, roll up her sleeves and help get dinner. Sentimental reasons have indelibly stamped in my mind one beautiful Sunday in early September. We were late from church. When we arrived, mother said: "Children, I was a bit afraid you would not come to see me today, that you were sick, my dear girl, or the baby was not well." Dinner was at a standstill. As we hastened to unhitch, mother said: "Father, you go out to the garden and get some potatoes." My wife whispered to me: "I believe there must be ripe tomatoes out in the garden, they were a little late but must surely have ripened in a week." With basket, pail and potato hook, and leading the little toddling four-year-old by the hand father and myself and the little fellow went back to the garden. The big black dog, returning from a hunting trip, had little respect for hygiene. He ran up and kissed the little fellow all over his face.

Father dug potatoes, I gathered the tomatoes, while the little fellow wrestled with the big good-natured dog, and tried again and again to induce him to roll over.

"Let's hurry and get the potatoes over, for the children must be awfully hungry, I'm about starved," said mother. The potatoes were soon boiling over the oil stove. Mother had got out the last ham and cut out generous pieces from it. The tomatoes were peeled and sliced and placed around the plates.

"We save out a lot of milk for the baby, and does grandma's little man like nice fresh milk?" mother said as she dipped from a cool crock a large glass for the little fellow. The rest was poured in a generous-sized pitcher and placed on the table.

"Do you want some eggs with the ham? mother asked.

"No, we are tired of them, we have had them all Summer. This is enough, we haven't got time to bother anyway, it isn't as though we were cooking for company or thrashers," my wife remarked.

We had coffee for dinner; this my father preferred. We had cream with the tomatoes, for sugar and cream on tomatoes was our peculiar way of preparing them. We had a generous apple pie, thick and well seasoned. Mother baked this Saturday. There was nice fresh bread, baked the day before, for Saturday was bake day for mother and she always tried to have something fresh for "the children" as she called my wife, the little boy and myself.

We did not have a sumptuous dinner: it was average, frequently we had better, and at times perhaps not as much. Perhaps if some person had come along and offered to buy the whole dinner prepared, we would have given it freely, and would have declared that it was not worth 30 cents. We were at no cash outlay for anything, we traded eggs at the store for the coffee and for salt; the rest was prepared on the farm. There was not much left after that meal. I finished the last drop of milk. Father poured out the last of the cream in his second cup of coffee. There was little bread, and of nearly a pound of butter, perhaps some was left for evening lunch.

We attached little or no value to this meal. I remember it distinctly, and sought to duplicate it at a delicatessen store in New York City. I did not go to the cheapest store, for I was afraid of the service, the quality of the goods, and I did not go to a high-priced store. I thought that perhaps I could get inside a dollar, for such dinner; that looked pretty high. I made out the order and handed it to the clerk. First he cut off some ham. I looked at it.

"Why, there is not enough, cut off some more," I said, and when he remarked "90 cents" for it and headed the sale slip with that figure, my dreams of duplicating a farm dinner in the city for anything like $1 were dispelled.

"Will you let me wait on this lady and then I will complete your order," the clerk courteously asked, which I gladly granted. The little baby which the woman carried bit at the mother's nose and cheeks in a playful way, and the woman said, "Nice baby, we'll have some nice milk for the little girl." The woman bought a quart of milk for the affectionate little one. For herself, but five cents worth of butter, a tiny loaf of bread and another purchase not to exceed five pennies.

A FARMER'S DINNER AT RETAIL—PRICE $2.22.

The clerk returned to my order. He seemed pleased at its size, yet I doubt if his margin of profit was large because of rent, service and goods passing through many hands before reaching him. He figured up the bill and handed it to me. I asked later in the day of one who is familiar with prices received for farm produce, and he estimated the dinner would cost say 90 cents.

In ordering, one pie looked too small so I ordered two. They were just about the size of the little pies my grandmother used to bake for me in a little tin plate which had alphabet letters all round the rim. These two pies made about one-half of the pie we had that Sunday for dinner, and I got them cheap at that. I ordered two loaves of bread. The loaves seemed about as long as my arm, but were just about as large around as a soda biscuit. There did not seem to be as much substance in the two loaves as in one of mother's nice large homemade ones.

Ten cents for the milk looked a pretty good figure, and when I studied the printed milk bottle cap, I couldn't blame the grocer for making the charge. I made the purchase Friday at noon, and the milk had been bottled Wednesday up in Orange County, New York. All of that time between somebody had to pay interest on investment, had to pay storage, insurance and the hundred and one little charges that grow with delayed sales. This milk in stock all of this time had to pay its share and yield a small profit, and ten cents a quart for milk, interest deducted might not have been serious.

Here is the sales slip:

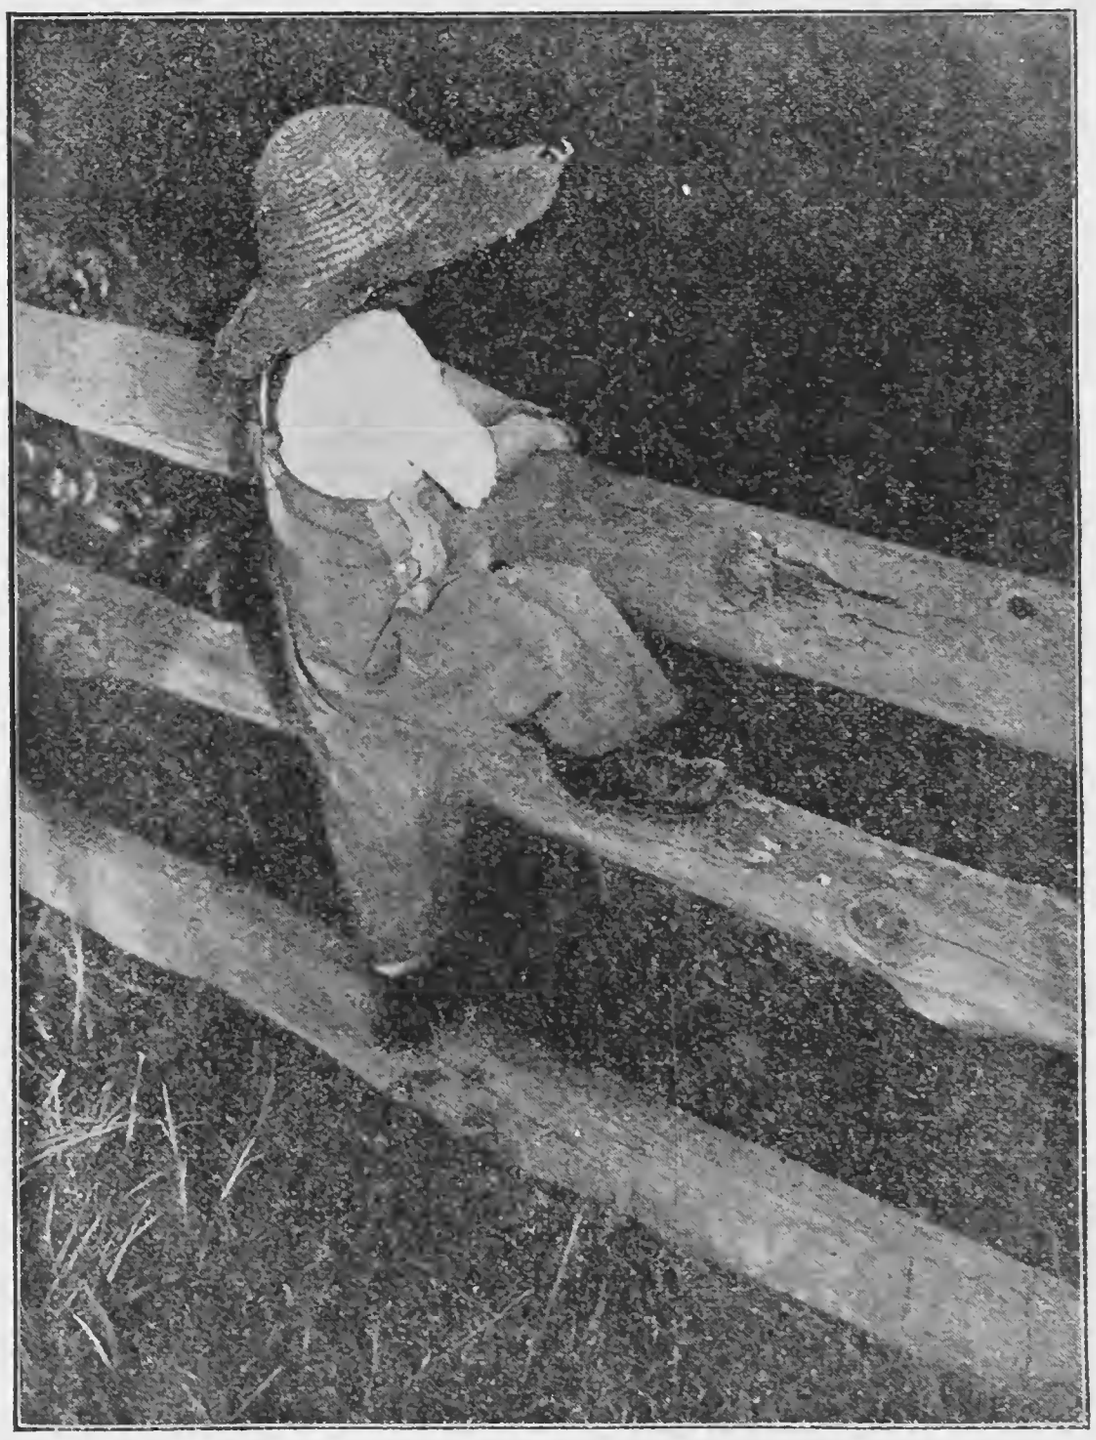
October 2, 1914.
Bought of Boskind Bros.

2 lbs. of ham	.90
1 quart of milk	.10
One-half pint of cream	.13
1 lb. of butter	.40
2 loaves bread	.20
2 pies	.10
9 tomatoes	.20
3 pounds potatoes	.10
One-fourth lb. coffee	.09
	$2.22

Two dollars, twenty-two cents and I considered myself lucky that I did not set out to buy a dinner for thrashers, for I could easily have multiplied the cost by 10, and then not had enough for an ordinary thrashing or silo filling gang. I was indeed glad that I did not attempt to duplicate the dinner at my father-in-law's home when the boys and their wives and their little ones, and my family were there. I did not enquire regarding rents when I learned that in some of the apartment houses $2,000 to $6,000 was the annual rental for a small suite of rooms, not half as many as in the old farm house at home. I did not enquire regarding dress, for one must dress in the city if he is in any line of work, laborer or professional man, and his wife must dress better.

"And what about being tied to a cow's tail morning and night?"

Think of being enslaved to a job noon and night with the fear any moment you may get fired! W. J.



A JOURNEY INTO A STRANGE COUNTRY.

"No Place."

THE new "professor" held the soft, girlish hand for a moment and, looking down into the bright, piquant face, said:

"It has been a pleasure to meet you, Miss Clayton. I should like to know you better. May I call some evening soon?"

There was no mistaking the clouding of the sunny face, nor the faltering of the ready tongue as she turned aside before answering:

"Pardon me, Mr. Thayer. I fear it will not be convenient."

The chorus of good-byes drowned his answer, and the girl slipped away. But on the way home from the academy she opened her heart to her chum:

"It is so hard to bear, Isabelle, and I know I am selfish, but how can it be helped? Of course it was splendid of father and just like his kind heart to open his home to the brother who was old and alone, but there are so many of us the home nest is overcrowded now. We all agreed to give up the parlor to Uncle for a sleeping apartment. I didn't realize quite what a sacrifice it would be until I found I had no place to entertain my young friends. I have refused

POEMS OF THE WAR.

THERE are many Americans who find their sympathies badly mixed up over this horrible European War. We are tied to Great Britain by ties of language and blood, and most lines of thought and sentiment. Our people also have great admiration for the German people—a strong, sound, loyal nation. Older people will remember the part taken by the Germans of the West and Southwest at the outbreak of our Civil War with gratitude and respect. These very feelings make it all the more necessary for this nation to preserve a strict neutrality in the fearful struggle now going on. The sentiment of a nation is perhaps best expressed by its poets and we give here two new poems, one by an Englishman, the other by a German-American.

Fall In!

By Harold Begbie.

What will you lack, sonny, what will you lack
When the girls line up the street,
Shouting their love to the lads come back
From the foe they rushed to beat?
Will you send a strangled cheer to the sky
And grin till your cheeks are red?
But what will you lack when your mate goes by
With a girl who cuts you dead?

Where will you look, sonny, where will you look
When your children yet to be
Clamor to learn of the part you took
In the War that kept men free?
Will you say it was naught to you if France
Stood up to her foe or bunked?
But where will you look when they give the glance
That tells you they know you funked?

How will you fare, sonny, how will you fare
In the far-off Winter night,
When you sit by the fire in an old man's chair
And your neighbors talk of the fight?
Will you slink away, as it were from a blow,
Your old head shamed and bent?
Or say—I was not with the first to go.
But I went, thank God, I went?

Why do they call, sonny, why do they call
For men who are brave and strong?
Is it naught to you if your country fall,
And Right is smashed by Wrong?
Is it football still and the picture-show,
The pub and the betting odds,
When your brothers stand to the tyrant's blow
And England's call is God's?

*

The German-American to His Adopted Country.

By George Sylvester Viereck.

The great guns crashing angrily
Sound, distant echoes, in our ear.
We pray for those beyond the sea
Whose lives to us are very dear.

We catch a mother's smile. We seize
In thought a father's hand again.
We see the house and, through the trees,
A girl's face in the window-pane.

May God above them stretch His hand,
For men are mowed as fields of rye.
Destruction rides on sea and land
Or drops, like thunder, from the sky

Columbia, though thou shed no tear,
Must thou fan hate with evil breath
Through ghouls in easy chairs who sneer
While these our brothers go to death?

Shall these that are thy children fling
Their gibes upon our brothers' scars?
We taught our hearts thy songs to sing,
Ay, with our blood we waged thy wars.

We fought thy fight when Britain's paw
Upon thy country's heart was laid
When the French eagle's iron claw
Perturbed great Montezuma's shade.

The dry bones of our kinsmen rot
In Gettysburg. Was it for this?
Are Schurz and Steuben both forgot?
Nay, thine is not a traitor's kiss.

Let not thy words belie the right.
Turn not from them that are thy kin!
Thy starry crown will shine less bright
If freemen lose, if Cossacks win.

*

THE scientific men have now found that the pumpkin really has curative powers in kidney diseases. Boiled pumpkin and skimmed milk is recommended as a diet in cases of Bright's disease. There seems to be no doubt about the genuine character of pumpkin as a "cure." Grandmother' pumpkin pie suits us better than any dose the doctor can put up.

*

THIS is a good time for all Americans to read Edward Everett Hale's "The Man Without a Country." There is no finer appeal to patriotic feeling in the language, and every child should be taught to read this classic at least once a year. Every New Englander makes it a point to read Whittier's "Snow Bound" in late November of each year, and all Americans—no matter where they come from—should read Hale's little story over and ove

A CHILD four years old, in New York City, recently choked to death on a peanut, which lodged in her throat. Here is another argument for peanut butter.

*

WINTER is coming. It is the dull season of the year on many farms. The family is crowded into the house, and there will be dull and cheerless hours unless we plan to make them otherwise. There are two things we should try for anyway. Make your house warm and your living rooms bright. You may not be able to afford a heater which will heat every room, but try to have doors and

"Books That Have Helped Me."

windows tight, and provide plenty of good fuel. If possible have an open fireplace. And do your best to provide a bright, clear light. Have a good lamp and make your evenings as bright as you can.

*

THE latest proposition for the country is a clothes club. This might take the place of the old "sewing circle" or better, work out of that into broader lines. Women and girls could study the developments in clothing and save money by buying material to better advantage and studying new plans for designing. In this way coöperative dressmaking would come to be great help. No one wants a woman to spend all her time thinking of dressing, but it is her duty to make herself as attractive as she can.

*

WE are sometimes asked why such a feature is made of trying to encourage farm women to make a little money of their own. Why not, instead of this, teach "higher aims and aspirations?" THE R. N.-Y. deals with the practical, human side of life, and has unrivalled opportunities for knowing the desires and the limitation of country people. "Money makes the mare go," is one of the old sayings into which has been packed a world of truth. One of the vital needs of the farm woman is the ability to handle and control a little money of her own. This does not mean a large sum—it is more in the *feeling* that she is the real owner and mistress of her own money. That feeling is the foundation of true independence and growth of the farm women. We like to get down to foundation principles, and that is why we do everything we can to encourage the woman on the farm to develop, if she can, a little business and income of her own. Fifty years or more ago a very large share of certain manufactured goods was made in farm homes. We can well remember years ago helping to braid straw, sew hats, wind yarn and make mats and rugs. The money thus made was saved by the women and much of it was spent in educating the children. Many a successful man today will tell you how his college expenses were partly paid by mother and sister, who made hats and clothing through the long Winter nights. As manufacturing has developed men have taken most of this work of feeding and clothing the world away from women and with it has gone the independent income of the farm woman of old days. Now we want to bring some of this money back by sending part of this work to the farm women.

*

VIRGINIA has joined the "dry" States—voting for State-wide prohibition by 30,000 majority. Only three large cities voted "wet," while the rural districts were "dry" by large majorities. One great argument against prohibition was that it will lose $700,000 annually in revenues to the State, but the people refused to consider this argument, and they will enforce the law. This makes 10 States with 16,550,000 population now under prohibitory laws: Maine, Kansas, Georgia, Mississippi, North Carolina, North Dakota, Oklahoma, Tennessee, Virginia and West Virginia. The situation in Ohio and Pennsylvania is hopeful. There will be an opportunity for the submission of the question in New York within a few years, and when the struggle does come the power of the temperance vote will amaze the public.

*

NOW we are invited to cut down the cost of living by trying various "mock" preparations. Mona Varne Lace, of the Colorado Agricultural College, says the following dessert for 12 persons will cost 19 cents:

Mock Plum Pudding.—One cup carrots, one cup potatoes, grated raw and put through grinder; one cup beef suet, ground fine; one cup raisins or currants, one cup brown sugar, 1½ cups flour, one teaspoonful each of nutmeg, cinnamon, and salt; one small teaspoon soda dissolved in three tablespoons hot water added last. Steam 3½ hours. Serve with sauce.

Try it on the family. It cannot hurt them at least.

*

ONE of our country readers was so impressed with a play at a New York theatre that she wrote inquiring whether a young girl should come to New York, and where she should go to seek a position, knowing it would be a reliable, legitimate business. This brings up the question of just who should come to the large cities seeking employment. What shall be the test to determine who will succeed and who will fail? What preparation is needed? What is the opportunity for a young man or woman coming from the free, healthful life of the country to the congested cities? There are openings. Many of our most successful men came from farms, but the city is also full of failures. We would like the views of our readers on this subject. What preparation, if any, is needed in this day of specialization? Who shall come and who shall stay at home? It is a vital question for many and we hope to take it up thoroughly.

*

The Father's Part.

WHEN I was commenting on the father's part in family life, as it looked to me, father quietly said that wives and children did not always do their part and he told me the story of our landlord in a certain place. This man was employed in a sewing machine factory, where he did some especial difficult work at big pay. His doctor wanted him to give up, as the work was killing him, but the man thought if he could keep on for a few years more, there would be money enough for always and then he and his family could have such a good time. At last the time came to leave the factory, then the man found he had made a big mistake. His two sons were practically ruined, their mother and daughter cared only to spend his money. The man knew he could not live many years, and the time must be spent in physical misery on account of some trouble like asthma. Supposing him asleep one night, he heard his sons express a wish for his death so they might spend the money. The daughter said: "Oh, he's too mean to die so we can have some fun." The man after that made his will so that when the money did come to them, it would come only at stated times, giving each a moderate income. K.

Wife's Pay for Housework.

THE daily papers recently had a story of a legal decision in New Jersey. Mr. Wendt owed a mortgage for $8,000 and endeavored to show that his wife had a prior claim of $5,592 because she had earned $6 per week for 16 years for doing the housework. The papers stated:

"When a husband pays a wife for performing household duties," said the court, "he is putting her on the plane of a servant. That is degrading to a wife. It is her duty under the law to care for her husband's home and for her family. Wendt testified that the mortgage held by his wife for $5,592 was for $1,000 she had loaned him and for her services in fulfilment of an agreement he had made with her sixteen years ago."

We are asked if this is sound law.

As is usual, the newspapers did not get the story very straight. The facts, are as follows: The bank held a judgment against Mr. Wendt. When Mr. Wendt saw that the judgment would probably be obtained he gave his wife a mortgage on his property in the sum of some $5,592, which covered all the equity which he held in this property. After the bank obtained its judgment, it commenced a proceeding in equity to have the mortgage of the wife declared invalid on the ground that there was no consideration and that it was made to defraud Wendt's creditors, and Master in Chancery Roe held that the scheme which Wendt used as the consideration for the mortgage to the wife, of claiming that he owed her $6 per week for 16 years, was merely a scheme used to put her mortgage ahead of bona fide creditors and on that account it was illegal. Roe did, however, hold that the $1,000 loan from the wife to the husband was a legal transaction and enforceable even as against the other creditors because he found, as a fact, that the wife was not a party to the scheme. As explained this way, this does not take on the appearance of an unusual case. It was merely another scheme to defraud creditors. Had there been any legal written agreement between husband and wife which was not used as a basis for fraud, it would probably have been held enforceable.

MILLARD DAVIS.

*

AMONG the public school teachers in New York City are a number of married women. Several of them have applied for leave of absence at the approach of maternity, and the Board of Education has adopted a stern rule. The case of Mrs. Peixotto has gained a national notoriety. This teacher notified the Board that she would be absent from duty. While in the hospital, after the birth of her child, she was served with a notice of her suspension. She was charged with "neglect of duty" and not permitted to return to the school room. There was no question about the reason; the Board of Education were determined that maternity should bar their teachers from the school room. The chief reason which they give that such teacher have a bad influence upon the morals of their pupils (!) is a remarkable commentary upon modern education and modern sentiment toward women. Among the thousands of comments on this affair the following by Mrs. Balch, the suffragist leader, is to the point:

At the present moment in warring nations a man teacher in school would and does drop his work to go to the front and perform a duty for his State. On his return he is not only given back his position, but he is honored above other men. But the Board of Education of the leading city in the United States declares that when women temporarily drop their work and march to the gates of death to create—not to kill off—our population, when woman does that the Board of Education of New York city declares that she has no valid excuse for absenting herself from school.

Far from giving her back her position and far from honoring her, they turn her out from her profession. The arrogance of men! It is a striking argument of the need of women to put their viewpoint in government.

The New York courts have decided that the Board of Education has the right to enforce this rule if they see fit to make it.

"No Place."

(*Continued from page 1289.*)

dozens—and now the new professor. Did you notice, Isabelle, how embarrassed I was? It was awful."

"I am so sorry, Louise," soothed her friend, "but it cannot he helped, and I am sure there will be some way out. If I can find out in time I will have you up to help me entertain the evening the new professor calls on me, and I know some of the Academy girls will invite you to come with them the nights of the promenades."

But Louise, usually so thoughtless and merry, hesitated before she answered.

"Do you know, Belle, it is very kind of you all, hut somehow I don't like it. For one thing it doesn't seem exactly loyal to the home folks, and it would lead to mistakes and misleading circumstances to entertain my company elsewhere. No, I feel as if I would rather be sure that I was a lady."

"Just as you like," retorted careless Belle. "But Louise, I cannot see any harm in your having your company somewhere. You always are queer."

The subject was dismissed with the good nights, but as the days went on the fact that there was no place to entertain company became a real, live trouble to Louise Clayton. At last she thought:

"I will ask Lucinda Graham. She always knows what is right to do."

A few days after this the girl broached the snbject to her mother, in this wise.

"Mother, don't you feel that I represent one-seventh of the earning power of this family?"

"Why, Louise, what do you mean?" gasped her mother.

"Bnt do I not?" persisted the girl. "Father works and each of my five brothers and myself. That makes seven, and I am one-seventh of the earnings. Therefore I should have one-seventh of the recreation. Would it be selfish, mother dear, if I asked for one evening in the week to entertain my friends? We will give you all the daytime, you best of all workers," added the affectionate girl.

"But, daughter, it is not selfish and only natural to want your young friends. I know this and am so sorry that since uncle came there is no place for you."

"But there is a place!" cried Louise. "I want my associates every one of them to know what a dear mother and sensible father and good brothers I have. The best of all places to entertain my company is in the midst of my home life. So no remonstrances, mother dear. Put on a fresh apron every Friday night for my callers are coming."

And come they did. A little note explained to the professor:

"The inconvenience which obliged me to refuse you the pleasure of a call has been done away or rather overcome. If you will not mind the dignified presence of the dearest father and mother in the world and the friendly advances of five big brothers I shall be glad to have you come with some others from the Academy for a contest in music and games next Friday evening."

They came, not only for "next Friday evening" but for the next and the next. They voted it the best place in the world in which to have a good time. Louise did not mind if they talked politics with father or jollied the big brothers. The home atmosphere was sweet and attractive.

When two years later "the new professor" asked Louise to make a home for him like the one her mother made he explained:

"It was seeing you in your home surroundings that first attracted me. It is to keep you with me in a similar environment that has become the desire of my life."

"Thanks to Lucinda Graham" exclaimed Louise.

FABLES OF THE FARM.

The Wise Parents Who Picked Their Son's Wife.

DOWN in Iowa there was a farmer and his wife who decided that their children should not have as hard a time in life as they did. As a result, Mr. Jones labored early and late in the fields, and was always on the lookout to make money on cattle, hogs and horses. In fact, nothing escaped him, and his good wife contrihuted her share by raising chickens, making butter and patching their clothes as long as they would hold

"After Their Hard Examinations."

together. She, herself, denied herself a new dress every year, being satisfied to go about in shabby apparel so that their bank roll might grow.

There were two children, Robert and Bess. After they had completed the country school, they were given the privilege of attending the high school in the little town nearby. Now, the school in question was a good one, but the constant allusions to the fact that the two Jones children were to be given every advantage in life turned Robert's head. Instead of being willing to attend the high school, he actnally refnsed. So the farmer had to send him to a way-up military college in another State, where the tuition was six hundred dollars a year. Of course there were other expenses.

But the farmer and his wife said nothing. They gritted their teeth a little harder and put their noses closer to the grindstone. In fact it pushed them so hard that they could not afford a new separator, even though the old one was really worn out. But then Bess did not need much, and they wanted to make life easy for Robert. For four years they paid. The boy came home every Summer, each time more unwilling to do anything about the farm. In fact, the last term he said nothing would do but a vacation to the mountains, where he and some of his fellow students were going to recuperate after their hard examinations. Again the father shelled out.

In the Fall Robert went to the university—not the excellent one which the State maintained, but one in the East. Here he spent money again, even more than he did at the military school. Bess, on the contrary, attended the normal school, and, after a term, taught in Wheatland, where she made her sixty dollars per month. When the farmer and his wife were nnable to pay more towards the son's schooling, she undertook to help, so most of her wages went to the brother also.

During the second year at school Robert discovered—quite by accident—that he was not cut out for a Daniel Webster or a Henry Clay. He was in love with a petite little miss, who had a perfect horror of rural communities. The boy explained the case to his loving parents as best he could, and intimated that should the opportunity arrive he would take unto himself a wife and get a job as clerk in some office in New York. Of course, the father was wroth, and Mrs. Jones cried, after which they held a family consultation. While discussing the matter pro and con, the daughter suggested that Robert should invite his lady love to visit them the next month. In fact Mrs. Jones wrote the invitation herself.

Now Farmer Jones and his wife had always set their hearts upon their boy marrying Amy Wells, the daughter of a neighbor, who knew how to cook and bake so that her husband, whoever he might be, could not find fault with her pies and biscuits. But they knew it would do no good to urge their choice, so they sat back and let things run their course.

In due time Esther Harris arrived. On her finger sparkled a shiny white stone which Dad Jones figured cost him about half of what his Fall hogs brought. But he said nothing, and under the direction of his wife and daughter sought to make their guest feel at home. Picnics, rides and dances were arranged, which mightily put them out, and caused the poor mother to slave the harder. But before the week was over Miss Harris was plainly bored, and at the same time vented her displeasure on the boy who was her promised husband. On the other hand, Amy Wells comforted her old playmate.

Quarrels followed between the engaged couple at frequent intervals after that. The breach widened. The crisis came when Esther announced that she never wanted to see a farm again, and that those who lived on them were bores and fools. It seemed that there was some of the old Jones stock in the boy, as he flared up and told her a few things, too. The upshot of the matter was that the girl went back to her home minus the engagement ring.

Two months later Robert married Amy, and settled down on an eighty near her father's farm. Jones, Senior, and his

He Could Find No Fault With Her Biscuits.

wife breathed a sigh of relief and the lines of trouble and worry which had furrowed their faces gradually disappeared. G. J. THIESSEN.

MORAL.—It is a true saying that you can lead a colt to water but cannot make him drink. That is because the critter knows you want it to stick its nose in the trough. G. J. THIESSEN.

Country Manners at Grandfather's.

"MY dear boy, I am so glad and thankful to see you looking so well," exclaimed Robert Dexter, as he clasped his only son in his arms as the boy stepped from the team.

"I could not help getting well, father, in the beautiful country, and at grandpa's too. I just hated to come back to this dirty old city, but I did want to see you and mother."

"I wish your mother loved the country, my boy, we would go there to live."

"Would you, father?" If mother would only go and see I am sure she would."

It is evening, the pretty home is lit up and Mr. and Mrs. Dexter are at dinner with their boy; all bright and cheerful. There are servants to wait upon them, and costly food. Harold sits by his father, and as the first course is brought he looks at his father and says:

"Grandpa always thanks God for the food every meal. Ain't you thankful, father?" Before the father could reply Mrs. Dexter answers:

"Grandpa is old-fashioned, Harold; people do not say grace any more except in the country." A hurt look came into the boy's eyes.

'Ain't you glad I got well, mother?"

'Of course I am, child."

"Well, grandpa asked God every day to make a well boy of me and He did."

"God had nothing to do with it," exclaimed Mrs. Dexter flushing.

"Yes, Harold, my boy. God had something to do with it, but fresh sweet air and change with different food helped very much. Mother is a little off to night," and Robert Dexter gave his wife a warning look.

"These peas are not sweet and good like grandma's. You told me, mother, when I went away I must eat and act as I did at home. When I tried to eat peas with a fork grandma laughed and said 'Take your spoon, Harold, that nice cream juice is the best part,' and I did. If you could see the lot of cream, yes, real thick cream, she put in the peas, you would want to eat it, and you can't with a fork.

"I am glad, Harold, you had such a good time, but I do not like the country, and wonder your father lived there as long as he did."

"Oh father, I wore your boots when it was wet."

"My boots, child, what do you mean?"

"The ones you wore when a little boy, just my age, grandma said; they were a little large for me, but they had copper toes and were so funny. Grandma said you outgrew them before any holes came in them, and she always kept them to remember her little boy by, and she cried a little."

A mist came before the eyes of Robert Dexter as he replied.

"I am sorry we have not been to see mother; a little visit would do her world's of good. Some way I have been so eager to get on in the world that she and father have been left out the last few years. I wish we might all go for a little visit at Thanksgiving."

Harold clapped his hands and almost shouted.

"Oh will you, father and mother? It would make me so happy."

"Don't make such a racket, son, the butler will think you are just from the woods," said his mother.

"I can shout and laugh as loud as I want to in the country; every boy and girl does, and you said, mother, grandpa was poor. He is not, he had lots of cows and horses, pigs and sheep and such dear little lambs. They have a big carriage and he drives Billy and Polly, they are so slick and fat, grandpa says he rather have the money in the bank than in an automobile. I think the horses are lots nicer; won't you go, mother?"

"Your father can go with you on Thanksgiving, but I don't care to go," answered Mrs. Dexter. Tears came to the boy's eyes, which he brushed away and busied himself with his dessert. The tears were too much for the mother heart after all and she said, "Never mind, sonny, perhaps mother will go. I will think about it." The glad look from the boy's eyes and the "thank you dear" from her husband was enough to decide she would go, and bury her dislike for country life for their sakes.

And at Thanksgiving at the old homestead found Robert Dexter with his wife and boy gathered around the big table with his parents for the first time in years and as the father and grandfather asked God's blessing on the food before them and thanked Him for the home coming of the loved ones which had tarried away so long there was a tremble in the voice, and Robert Dexter joined in the Amen. MRS. FREDERICK C. JOHNSON.

Dyeing a Coat.

I HAVE a dyed black dogskin coat, and when packed away for the Summer chemical action took place so as to turn it dark red. Do you know of any method by which I can successfully dye it at home? Only a few small places affected. S. S. C.

Dying a coat of this character is naturally a delicate piece of work and more particularly when it is to be done in small places only. The great difficulty S. S. C. will encounter will be matching the shade of black. I would suggest the following: Take a small quantity of nitrate of silver, dilute it with an equal quantity of water. Take a rather coarse fine-tooth comb, dip the comb in the solution and comb the hair where it is discolored. Continue applying this solution until the desired shade of black is obtained. To make it blacker increase the quantity of nitrate of silver. To make a brown shade increase the quantity of water in the solution. Be careful not to get any of the nitrate on the hands, as it will make a black spot and no known chemical will remove it. It will have to wear off. Nitrate of silver was formerly used as a hair dye and was applied to the hair or whiskers in exactly this manner. By exercising care the exact shade of the rest of the coat can be obtained. E. A. C.

Inexpensive Things a Girl Can Make

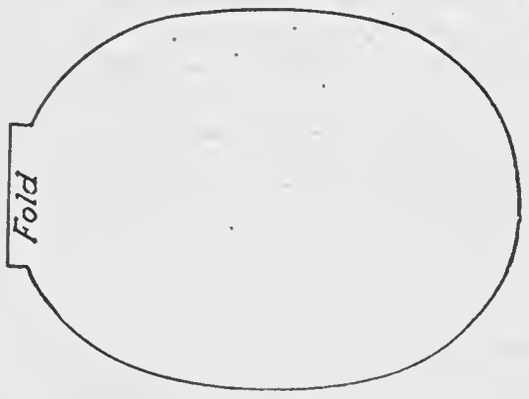
Where Love Substitutes for Money

By Edna S. Knapp

[NOTE.—Miss Knapp is ready to answer any questions about these or other simple gifts which girls may ask. As an expert teacher of sewing and domestic work she can help in many a household problem.]

THINK first what the recipient would enjoy, not so much what you want to make. Choose something simple enough so that you can do most of the work. If you can earn or save the money to buy the material, so much the better.

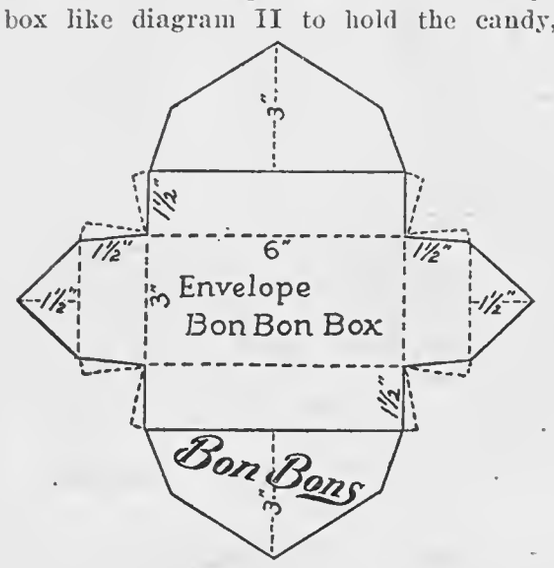
Grandfather would like something to clean his glasses, large enough so he can handle it easily. Better make two, as he sometimes mislays one. See diagram I. Cut one piece of chamois by the pattern and one of fancy silk. Lay the silk over the chamois, baste both together close to the edge. Now buttonhole the edge with embroidery silk, the stitches one-eighth inch apart. Take out bastings, fold double with the silk outside and sew a bow on the fold; use ribbon to match the embroidery silk.



HALF OF EYEGLASS CLEANER.

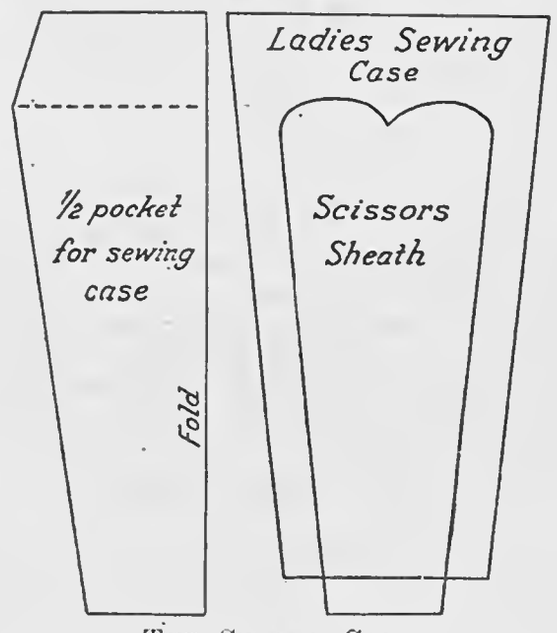
Grandmother still wears dainty muslin ties in the morning, and cannot buy them now. Take a strip of fine lawn 3½ by 40 inches, cut the long way of the goods, you can make a narrower hem this way. Fold a narrow hem on each long side, use fine thread, about No. 120, so the stitches will not show. Mark scallops across the ends and buttonhole with white floss. Mark little circles above the scallops with your thimble and featherstitch these. Father has a sweet tooth, so make him some candy by this recipe.

"FATHER'S CANDY."—Two cups light brown sugar, two-thirds cup milk, one scant cup cocoanut. Boil to soft ball stage, remove from stove, add two heaping teaspoons butter. Flavor with wintergreen and beat like fudge. Make an envelope box like diagram II to hold the candy, of bristol board. Mark around all the edges with red crayon, then trace a line inside this with green crayon. Print the word Bonbons with both colors and tie at the corners with red and green Christmas ribbon.



FOLDING CANDY BOX.

Mother could use a sewing set. Choose some silk that is especially pretty, but will not soil easily. This set will take five or six hours to make. Cut four pieces of bristol board like diagram above. Cut one piece of silence cloth, also. Then cut four pieces of silk one-half inch larger all around than the pattern. Cut one piece of silk for the pocket. Cover the bristol board pieces with the silk ones and oversew, inserting the silence cloth between one pair. These make the covers of the needlebook, the thicker one holds pins stuck in its edges. Turn down the hem on the pocket piece, make a casing and draw up with narrow elastic. Turn under the edges, laying pleats at the bottom and oversew to the other cover. Cut three leaves of white flannel a little smaller than the case, and notch the edges, sew in place. Oversew the covers across the narrow end. Put a bow of one-half inch ribbon on the middle of the casing and close the covers with ribbon strings. For the scissors sheath, cut four pieces of bristol board like diagram and four of the silk one-quarter inch larger all around. Cover



THE SEWING CASE.

the bristol board with the silk, then oversew the two covered pieces again, leaving the scalloped end open. Add bows of ribbon at each side of the top; 1½ yards of ribbon will do for the sewing set.

Big sister likes sachets to put among her clothes. Get a pretty lace-edged handkerchief, cut it in quarters and hem the cut edges. Make sachets from squares of violet silk the size of the hemmed squares by folding diagonally across the middle. Lay the handkerchief section over the sachet, tack in place at the corners and add ribbon bows. Half violet sachet powder and half orris root is a sweet and lasting odor.

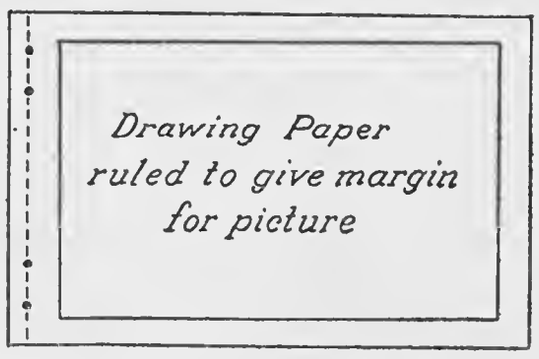
Aunt Ella is always wanting a pin. Cut six pieces of bristol board like diagram below, cover with fancy silk and oversew. Hang from ribbons of varying

TO HOLD THE PINS.

lengths with a bow at the top. Buy a pin cube and arrange the pins from it in these hearts. A girl of 12 made this in three hours.

Big brother uses piles of blotters. Take a dozen blotters, separate a calendar pad and mount one leaf on each blotter. Cut a piece of bristol board or water color paper the size of the blotter, make slits in it like those in your post card album. Insert a Christmas post card, paint one yourself if you can. Lay the cover on top of the blotters and tie at each end with holly ribbon.

Little brother loves to color pictures but cannot handle a paint brush well,



FOR THE SKETCH BOOK.

and most drawing books are too hard. Get the easiest set of light and shade studies from any school supply house, buy a thousand sheets of drawing paper (30c.), and have a sheet of mounting board (8c.) cut into pieces 6x9 inches; you will have seven pieces. The extra ones can be used to mount pictures and calendar pads. Now rule a number of sheets of drawing paper like diagram below. With an eight color five-cent box of school crayons, copy as many of the studies as you have time and patience for. Follow the printed directions that come with each. On an equal number of ruled sheets, draw as many of the studies, but do not color them. You will find there are very few lines to put in. Lay your copies in pairs, a colored one facing an uncolored one. Punch holes in four places, punch holes also in two pieces of mounting board and tie into a book with narrow ribbon. Do a small sketch on one-half of drawing paper, letter it "Beginner's Sketch Book," and paste onto the cover. Your book will look something like diagram below. An

THE BEGINNER'S SKETCH BOOK.

older girl I know colored 12 crayon sketches, one for each month in the year, copied a dozen suitable hymns and tied all into a pretty cover. She called it a "Year Book," it was a gift for an invalid friend.

Daisy's fairy godmother has everything heart can wish for, but is growing old. So this year Daisy will lend her clever fingers in making some of the hundred gifts this dear lady uses.

The Little Peacemaker.

ALL sorts of human tragedies and comedies are worked out in this great city—a wonderful spot for the study of human nature. Last week a little child of three stopped the strife between her father and mother, and led them joyfully out of court for a new start in married life. There was trouble between this couple. It was the old story of the sensitive young woman trying to live with her husband's family. They would probably have made a good start and got on well could they have gone into a home of their own to begin with, but they started in with the old folks, and fault finding led to criticism until the too common end was reached. The man and his wife went into court, asking for a separation. Justice Weeks, with a good knowledge of human nature, saw the real trouble between these young people, and he tried to bring about a reconciliation. When the woman gave her testimony on the stand the judge saw that her grievances were not too serious to be mended by a little tact and self-control, and so he stopped her in the midst of her story, and said that he would adjourn the case for one month, to see if these young people could not forget their differences and start over, and this was what the good judge told them:

I believe the fires of love can be rekindled in this case. Why don't you both take your little girl and go to some quiet suburb to live where you will be alone? Let the wife take off her kid gloves and do the housework and let the husband devote himself to his home exclusively. The lawyers, too, must forget the words that have been said and not permit them to stand between their clients and their future happiness. The motto of young married couples should be, "He who gives most gets most."

The woman left the witness stand in rather a bewildered frame of mind, and just as she reached her seat, little Miriam, the daughter, slipped off the lap of a woman who was holding her, and ran up to her mother's side. The New York *Sun* tells the rest of the story. It is to be hoped that this little peacemaker will have her way, and that these young people after their quarrel will find that the judge is right, and that it is for them to forget their differences and start over.

"Are you and papa going to take me home now?" asked Miriam.

Before Mrs. Wodiska could answer the child led her across the room to a chair where Wodiska was sitting with his attorney. When the wife faced her husband she put her handkerchief to her eyes and sobbed. Wodiska jumped up and embraced her. Then he kissed both his wife and little daughter, his own eyes filling with tears. The child looked from one parent to the other with a puzzled expression. She didn't understand that she had been a successful mediator.

But Justice Weeks understood.

"Adjourn court," he said. Then he left the bench and patted the curly head of the little peacemaker.

Snowy, Puffy Doughnuts.

"WHAT delicious doughnuts! If I thought I could make such good ones, I'd be a happy woman. All my men-folks are doughnut eaters, and I fail at every attempt, so the baker reaps the benefit. Mm—hm, but they're good," and Mrs. Ray again helped herself to a crisp brown ring, hot from the kettle. "I never saw such puffy homemade ones.

Mrs. Patt smiled. "I'll tell you the secret if you wish."

"Do begin from the beginning," begged Mrs. Ray, "and I'll take notes."

"Take any good recipe for doughnuts," began Mrs. Patt, "and cut them out before putting the fat on to heat."

"Why, why, my mother——" expostulated Mrs. Ray.

"Yes, I know our mothers," laughed Mrs. Patt, "but any mixture to be fried in deep fat is improved by standing, even hours, and fries much easier, too. In fact, one may fry one-half the quantity one day, and the remainder the next day, if it be kept cool, and covered."

"And then one could have hot doughnuts for breakfast!" exclaimed Mrs. Ray, delightedly.

"Surely; and cut them out with a rotary cutter, a great time-saver, and costs only 12 cents by mail."

"I am glad to know about that, and now for the secret of the puffy doughnut. How do you accomplish that?" asked Mrs. Ray, eagerly.

"That's easy," encouraged Mrs. Patt. "Simply keep the kettle in which the doughy rings are frying covered, and they will rise to double their original size. When all are cool, put two tablespoonfuls of confectioner's sugar in a large bag, put in three or four doughnuts at a time, and shake bag gently till doughnuts are coated with sugar. Continue till all are sugared, then put away in covered tin, and the last one will be as good as the first."

Mrs. Ray hurriedly arose. "I'm going home to try my luck this minute!"

C. H. WEEKS.

Grape Juice From Whole Grapes.

I NOTE on page 1164 a note on unfermented grape juice. Fairly good unfermented can be made in the way there described, but I would like to tell your readers how the very best unfermented can be made. In our town is situated the largest unfermented grape juice plant in the world, where hundreds upon hundreds of carloads of grapes are made into juice. It is not their plan, however, that I would describe, but a plan that is easier than the most simple canning operation, and that gives a juice that is without comparison, clear as crystal, tastes just like fresh grapes and has no cooked or burned flavor.

Use ordinary two-quart glass cans. Place the can tops and rubbers in boiling water. Pick the grapes from the stems, wash them and in each can put one pint of the grape berries and one half pound of granulated white sugar, then fill the can with boiling water and seal. That's all there is to it. Care must be taken to see that the water used for filling the can is *boiling* hot and that the can itself and the top and rubber is also boiling hot until sealed. If larger or smaller cans are used, use grapes and sugar proportionately.

Do not crush the grapes or try to separate the juice from the pulp, do not cook or even heat the grapes. There are enough heat units in the rather more than three pints of boiling water to bring the whole content of the can up to the point necessary for sterilization, but not enough to leave a cooked taste. Place the cans in a cool cellar and do not disturb till ready to use. If the work is carefully done it will keep a year, two years or more. The water dissolves out the flavor and coloring but none of the cloudiness of the berries leaving them about full size but without much substance or flavor.

Mobilizing the Family Against the Pig

"WE are all tired of salt pork, and it is pretty near gone anyhow. The nights are getting chilly, there is corn husking and a lot of good hard work yet to do, and we need some fresh meat." When mother says this, she has spoken "law." One little fellow says he wants a piece of spareribs, and all shout tenderloin, even though dinner may be delayed until the middle of the afternoon. The old iron kettles are rolled out from the shed, and every butcher and bread knife on the farm is found and sharpened. The oil barrel is leaned up against the flat sled, and everything is ready. Then is when the sadness of the mobilization of the whole family. The little girls run to the house and cry, for they do not want to hear piggy squeal, mother even stops her ears, while the older boys try to look brave. As the father slips over in the pen he says: "Old fellow, you've had a pretty easy time, you haven't had anything to do, we have fed you, and it is a pretty easy way to die." The modern way is to can a part of the meat as we have described.

THE FAMILY ARMY LINED UP AGAINST MR. PIG.

Freaks of Fashion.

IT is amusing to read the current fashion notes. The fashion makers take themselves so seriously. Dutch collars are deader than a door-nail; loose floppy waists are defunct, and everybody that is anybody is wearing a basque and a flaring collar of some sort. I have a friend who is a joy to the eye in a Dutch collar, while in one of the flaring sort she looks like a pig in a poke. I have a blind friend to whom I try to describe the latest freaks of fashion. The new skirts I tell her look like the old-fashioned pantalettes. That pantalettes were not worn in my day rejoices my heart when I look at the photographs of some cousins who preceded my advent to the world of clothes. Poor innocents, victims of the hateful tyranny of fashion! Somewhere (out in Kansas I think) a movement has been started to encourage individuality in dress. How delightful it would be if everybody were to wear becoming clothes. I have a conviction that pantalettes and some other creations of fashion never had an excuse for being. They couldn't possibly be becoming to anybody. Why in the name of sense does anybody wear what is unbecoming?

C.

IT seems a sin that these golden days of October should find anyone idle with half the world likely to be in dire need before another harvest. Here we are two of us on a farm that furnishes ample work for four people. Where are the other two? One of the daily papers in a nearby city is calling for increased taxation in order to furnish work for the unemployed. I have tried various times to get help from this same city, but the city dweller looks with disdain on the country job. Scarcely a day passes that we are not asked to give something for somebody. Are we to be taxed lean and give ourselves poor that these "I won't work at anything but my regular job at full pay" gentry may carry their point? We are willing to share with those who cannot help themselves, but in view of the untold misery that is coming upon the world, every person able to work should be willing to do anything that is honest. There is no lack of work. C.

A Bunch of Questions

We Want to Know

Summer-Itch; Buckwheat Straw.

WHAT is a cure for Summer itch caused by Filaria irritans, a germ, so a veterinarian tells me, if there is any known cure? Is well-cured unthrashed buckwheat straw fit to feed for roughage to a horse that has scarcely work enough for exercise, also feed other grain with the straw? W. C. R.

Vineland, N. J.

The treatment for Summer itch caused by Filaria irritans infesting the skin of horses as given by a report from the U. S. Bureau of Animal Industry is to rub the surface of the wound with iodoform and cover it with a layer of collodion, repeating the applications every twenty-four hours for fifteen days, or until the sores heal up. Ether or chloroform may be used in the place of the iodoform, pouring it onto cotton wool and applying it to the sores for two minutes before covering them with the collodion. Buckwheat straw makes fair roughage for idle horses and may, of course, be supplemented by grain for those doing hard work. If fed, unthrashed, a bundle should be shelled out so that some idea of how much buckwheat grain the horse is getting in it may be had. Buckwheat straw for cows and horses has never enjoyed a high reputation as a feed but necessity has taught many farmers that it is by no means to be despised when better roughage is not at hand.

M. B. D.

Unruly School Children.

A PUBLIC schoolhouse is situated adjoining my farm, and I have great annoyance from the pupils who attend. They do all sorts of mischief, and I have tried time and again to correct them, also have spoken to the teacher repeatedly, but to no avail. What course can I pursue to have them behave?

New York. MRS. A. S.

Such things are certainly annoying and the more so that one does not wish to offend neighbors by complaining of the acts of their children. A complaint on your part to the trustee of the school with a request that he speak to the teacher, and if necessary, to the pupils warning them against trespassing upon your property might have good results. The teacher is responsible for the behavior of the children while at school and the parents are, of course, liable for any damage that they do at other times. A statement to the parents of the most unruly children that they will be held responsible might have good effect. After all, one has to put up with a good deal from thoughtless children, and try to take it out in recalling the mischief of his own youth. They sometimes go beyond the limits of patience, however, and something has to be done. I think that most parents are willing to curb their children when informed of their pranks, and it is best, all around, if this can be brought about without stirring up unneighborly feeling. D.

Women on Public Land.

COULD you or anyone on your staff put me in touch with one or more women who have received land allotted by the government and who have made a success in cultivating it? A friend and myself are extremely anxious to become the owners of such land on which to raise cattle or hogs, but we are at a loss where to get the necessary information as to how we shall go about it. Quite some time ago I wrote to the Secretary of the Interior asking for details regarding the allotments of land, but have not yet received a reply.

Pennsylvania. JENNIE R. OWEN.

In such a case we are obliged to refer to our readers. We have no doubt such women read THE R. N.-Y. If this meets their eye we should like to hear from them.

Marriage and Birth Certificates.

A YOUNG man was married six years ago. Three children were born at intervals of two years. Last year he undertook to find birth records and none were obtainable. The town clerk claims there is no record of such births, and to all appearances no marriage certificate was filed at the time. Is the town clerk the proper person to go to, or the county clerk? One physician attended the first birth, and another the other two. A letter addressed to the first physician brought no satisfactory response. Are these doctors not responsible for the proper filing of these certificates? Kindly inform me how to proceed in the matter to find these records, as it leads to great tribulations to the parties concerned. F. L.

New York.

The New York State law requires that birth and marriage certificates be promptly recorded in the office of the town clerk of the township in which they occur. The birth certificates should have been filed by the physician in attendance and the marriage certificate by the one performing the ceremony. If they were not so recorded, either the attending physicians, the officiating clergyman, or the town clerk were guilty of gross neglect of duty. A copy of these records is sent by the town clerk to the State Department of Health at Albany, N. Y., and by writing this department you may learn whether any such certificates have ever been filed with them. There has been a very regrettable carelessness on the part of physicians and clergymen in the matter of filing vital statistics in the past and the State Department of Health is now vigorously enforcing the law covering this matter. M. B. D.

Distemper or Consumption in Cats.

IS there anything that will cure cats of a throat disease? We have some that otherwise seem healthy. They choke and cough when eating or drinking. The kittens catch the disease. They are kept in the barn and are fed well.

A FARMER'S WIFE.

It should be remembered that cats often contract incurable tuberculosis from drinking the milk of tuberculous cows, so it always is well to test the cows with tuberculin, if the cats are milk fed, and the cows have not been tested. Cats also suffer from diphtheria and should never play with children when affected with cold, cough or sore throat. Distemper commonly is present in cases such as you describe, and it often proves fatal. It is a contagious germ disease. Clean up, disinfect and whitewash the stables and make the cats sleep in such a sanitary place. Good care and feeding is imperative. A pinch of sulphur or of bicarbonate of soda in milk or water is helpful at the outset of an attack and a drop or two of tincture of aconite may be mixed in the drinking water, if the fever runs high. A. S. A.

SUNDAY SCHOOL TEACHER: "What do you understand by suffering for righteousness' sake?" Little Girl: "Please, miss, it means having to come to Sunday school."—Credit Lost.

BISHOP Olmstead was talking about boy nature. "I once said to a little boy: 'Do you know the parables, my child?' Yes, sir,' he replied. 'And which of the parables,' said I, 'do you like best?' 'I like the one,' he answered, after a moment's thought, 'where somebody loafs and fishes.'"—San Francisco Star.

Plan It Out Now

::: WHAT :: WOMEN :: CAN :: DO :::

"THAT PANTRY OF MANDY'S" interested me exceedingly, it was so true to life, and illustrated so well the usual actions of the average farmer. There is no class of women who can help their husbands so much in their work as farmer's wives. The men do not seem to realize that it is to their interest from a practical standpoint, if no other, to keep their women folks in good health and a happy frame of mind. This they could do by giving her all the conveniences in the house that are possible for them to get, and by doing the hard work in the kitchen garden, for plenty of fresh vegetables are as good an investment as a farmer can make from the standpoint of health and grocery bills. Now, when "Mandy" wanted the "tiny box of a kitchen bedroom" turned into a pantry and the shelves taken out of the much larger pantry and turned into a bedroom Ephraim had so much outside work he could not possibly take the time to fix it, even in Winter. And think of the amount of work it took that long 10 years before the new house was built to keep that pantry clean, and the number of steps it took to go 'way across the sitting-room each time. Yet we see that the new pantry was built according to Mandy's idea because it did not suit Ephraim, he could drop his regular work and fix the pantry the way it should be (according to his idea).

MAN'S AND WOMAN'S WORK.—How much better it would have been for all concerned if Mandy had at first insisted on having things fixed so as to save her health and strength. But when I say "insist," I do not mean to nag and nag until you get what you want, but simply set about doing things yourself and let some of the "women's work" go while you are doing the man's work. If a man had to make his dinner and supper from milk, bread and butter and cheese or apples (cold things that don't have to be prepared) because you were fixing the pantry, or kitchen shelves, etc., I do not think you would have to work the second day at the man's work. However, some men are very stubborn, and it might take two or three lessons to bring them around, and in the end it works for the good of both husband and wife, for there is not the man living who will not respect and love his wife more if she makes him respect her rights and feelings, provided it is not done in a nagging way, and also provided she does her part as the wife and homemaker.

STARTING AFRESH.—And right now is the time for each farmer's wife to turn over another page and start anew, instead of on January first, as is so much the custom in theory, whether or no in fact. For now is the time to plan your next year's work and provide accordingly. First and foremost to consider is what improvements can be made in the house to facilitate work and save steps. Have you a pulley line extending from just outside your kitchen door, which saves many steps, besides saving your shoes and skirts from getting wet with the dew in Summer or the snow in Winter? Even if you have not running water, have you a sink with drain in it and a large drainboard on the left and one-half as large on the right? This should be large enough to accommodate all the soiled dishes from a meal, the pots and pans being placed on the right hand side.

A HANDY SINK.—Let me tell you about the one I had, for it was the most convenient one I ever saw, and every housekeeper who saw it said the same thing. My kitchen was 13 feet 6 inches on one side. In the corner farthest from the dining room was my kitchen cabinet, the lower part of which held cake tins, bread tins, muffin pans, etc., and on the right side of this was an aluminum covered drop table, which came in front of a window. Right next to this I had my drainboards and sink. The first drainboard was made of heavy boards with two wooden legs, and with a front edge four inches high. Most of the ready-made drainboards either have no edge or only one about an inch or two high; consequently one cannot pile many dishes or things up on them without their tumbling off. This was made about four feet long by 21 inches wide, and was covered with zinc, which lapped over the edge of the sink. The entire wall back of drain-boards and sink was covered with zinc, and where the two edges of the drainboard and wall met the zinc was soldered, so that there was not a crack anywhere that a drop of water could get to make things unsanitary. The sink was a gray agateware one, as these are easier to clean, I think, than any other kind. It was 20x30 inches, which is large enough to set an ordinary-sized dishpan right into. At the right of the sink was another drainboard made the same as the one on the left, only it was just about half the size.

CO-OPERATION IN THE POTATO FIELD.

NEARBY CONVENIENCES.—There was a small window right above the sink, so that there was plenty of light in the daytime, and at night there was one light right over the sink. In the right-hand corner above the sink was a small shelf which held a bottle of ammonia, box of borax and a box of soap powder. Hanging up above the sink I had two agateware soap dishes (which I have had for 11 years) one for soap, the other for sapolio; and a wire basket in which I kept a large and small scrubbing brush for cleaning vegetables, etc., and a wire dishcloth. My dishmop I always hang outside the kitchen door in the fresh air, as well as the dishcloth. The drainboard was made slightly higher at the end away from the sink, so that all water would drain away. When washing dishes I had a pan of hot water in which I rinsed tumblers and cups before putting them to drain, but the different plates I piled up against a cup or bowl and poured boiling water over them. I usually let the dishes drain until I made the beds or did some baking, or whatever was next on the schedule, and by that time they would all be dry and ready to put away.

OTHER HELPS.—I always put kettles to soak in cold water the minute food was taken from them, so that by the time a meal was eaten and the other dishes washed the kettles were easily washed, too. If greasy things had been cooked a little soap powder put into the water and the kettle placed on the back of the stove made everything all right, and outside of a place where there is a regular dishwashing machine I will venture to say you could not find a place where the dishes were so quickly and easily washed. When washing vegetables, canning fruit, etc., the drainboard and sink together made it very much easier, and the only other table I needed was a small zinc-covered one right near the stove, which made it very handy in dishing up a meal.

THE KITCHEN SAFE.—Another thing that saves a great many steps is what is known as a "kitchen safe," which is really a wooden cupboard with fine window screening set into the sides and door, and is meant to keep food in when it is cool enough to do without ice, or to keep things in in the cellar that do not need a refrigerator in the Summer. These to buy cost from four dollars up, but it would be a simple matter to make one from a box which could be procured at a dry goods house for 10 cents, and the shelves could be made from a smaller box if no other lumber was available. The one important thing is that it should have short legs of some sort and then if these are set in little dishes of kerosene no ants or bugs of any kind will be able to crawl up into the safe. In the Spring and Fall if this safe is put on the back porch or shed, or anywhere near the kitchen where it is cool—only, of course, it must be protected from any dust—it will save a great many steps where things usually have been kept down cellar.

PLANNING FOR BOARDERS.—In planning for next Summer's work, are you going to take boarders? Well, then, instead of giving them so much meat bought at the butcher's, raise more chickens, so that you can have it several times a week instead of once or twice, as they do at most country boarding houses. Or even if you are not taking boarders can't your butcher pay a fair price for them, and wouldn't you like the little extra money from them? If so, get your houses ready now, and fence in the orchard for them to run in, or a large run with plenty of shade, for they won't do well in a small, hot yard. The houses will only need to be very simple if they are not to be used in Winter, but have them waterproof and so they can be easily cleaned. Also, if you have not had a good kitchen garden now is the time to plan for one. Have the ground plowed up, the stones picked out etc. Have you currants, plums, gooseberries, raspberries, blackberries, grapes, peaches, pears, cherries and all kinds of apples? If not, plant some either this Fall or in the Spring. Just a few of each will mean so much in enjoyment and health as well as saving in money, particularly if you take boarders.

HOME SEWING.—In planning the sewing, if you have a large family and house to take care of without help let some of the things go that you have been accustomed to doing, as, for instance, sewing rags for carpets, quilting, hemming by hand dish towels, ordinary napkins and tablecloths, and instead take the time you would have taken for those things in resting or recreation in the fresh air. You can buy nice big quilts that are very warm for two dollars apiece, and it will be easy enough to earn that two dollars by raising more chickens or garden stuff, for that is a much healthier way, as it keeps you out of doors. The trouble with most women on farms is they don't get fresh air enough. Of course, I know it is considered much nicer to have all your linen hemmed by hand, but when you consider how much time is saved by using the machine, and how much better it would be in the end for the women to take that difference in time to rest or for outdoor work it is only using common sense to do the latter. And last, but not least, try to plan a little vacation for yourself this Winter. Now I can well imagine the number of women who have large families to take care of thinking they cannot possibly take any vacation, but the old saying is, "Where there is a will there is a way." If it is no more than one afternoon a week for a few weeks. Borrow a book or buy a magazine to read—something that will interest you so much that you will be taken mentally right out of your present surroundings, and bundle yourself up well and sit outdoors in a sheltered corner somewhere in the sun. You will be surprised how much good this will do the tired nerves. Of course, if you can make a visit to someone and have a complete change of scene the better it would be. But you will say, "How will my family get along?" How would they get along if you were taken seriously ill? If they could manage then they can manage now so as to save a possible sick spell. F. B.

New Uses for Bi-Carbonate of Soda.

WHILE a great many of your readers may be familiar with these uses for soda, I am sure there are a great many more to whom they will be new, and it has helped me so much that I would like to pass the idea along.

If spread around where there are black ants (or any other kind of ants I should judge) it will not only kill them but drive the others away.

For anyone who is troubled with rheumatism—which is caused by uric acid in the blood, the doctors say—one-third of a teaspoonful taken three times a day, in half a glass of water, about an hour after meals is preferred. That is to say if they are feeling twinges of rheumatism, or if they have gas on the stomach after eating, or a sour stomach, the soda will be a great relief and very helpful. The best part of it is that if anyone has any of the above mentioned things the matter he could not possibly be hurt by the soda even if he took a much larger dose (so my doctor told me). It has certainly helped me wonderfully, and is a thing that most people always have in the house.

Stout nervous people who perspire excessively under the arms, and where it has a very disagreeable odor, can do away with this odor by bathing under the arms with a strong solution of soda water. I have tried a good many things, but none of them seemed to be effective

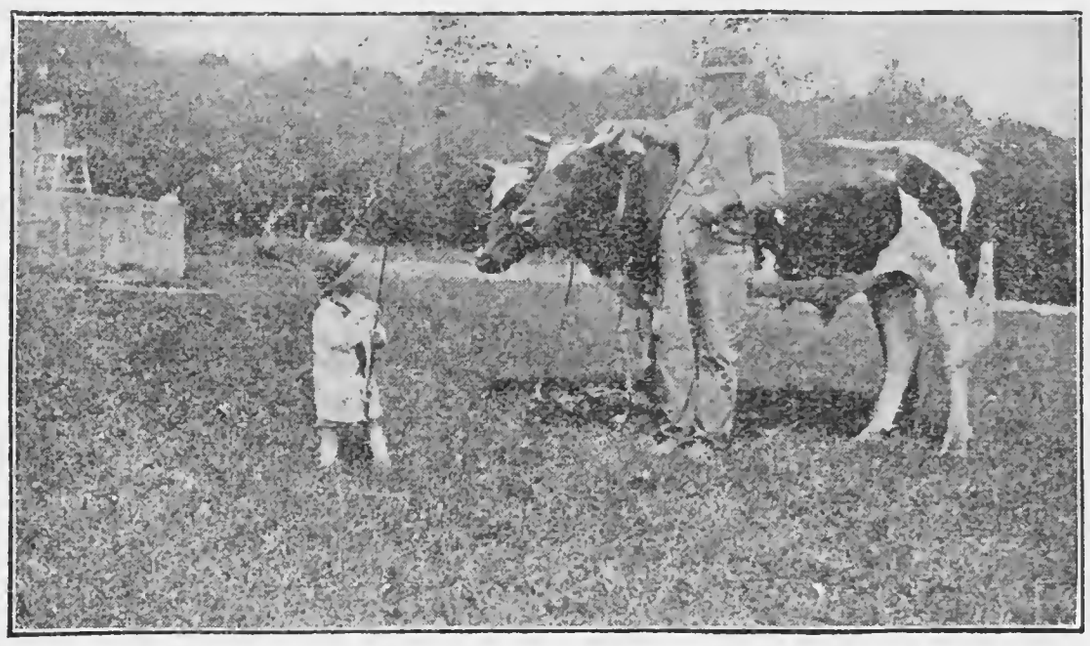
While speaking of perspiration I will tell you about another discovery of mine, which will be very helpful to anyone who perspires excessively. Try reversing the position of your shields when sewing them into your dress. That is, put the pointed parts, which usually go to the back and the front, along the arm and down toward the waistline and you will find that you do not need as large a shield—which of course will effect a saving when buying shields, and the shield you do buy will be in the place it is most needed.

MRS. FLORENCE BELLE.

Everything of Human Interest

Oxen to Earn Automobiles.

THE picture below, is sent us by Mr. H. M. Clark of New York. He says he wants to show his two-year-old grandson and the choice yoke of three-year-old steers. Mr. Clark has a farm of 125 acres, and he keeps horses beside these oxen. He says he is a firm believer in the theory that farmers ought to raise more oxen to do the slow, hard work of the farm, and then turn around and help out the nation's beef supply. Mr. Clark says if more farmers would do that and keep more of these oxen, they would have more money with which to buy an

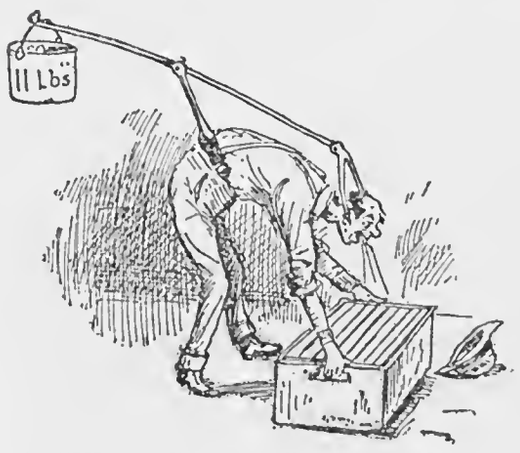


TWO YEAR OLD BOY AND THREE YEAR OLD STEERS.

automobile. This idea of using the slow ox to obtain the price of a rapid automobile is surely a new one, and we have no doubt that the two-year-old boy will grow up to drive the car which the three-year-old steers will haul into the family. There is probably much truth in this idea of keeping more oxen on a dairy farm where the large breeds of cattle are bred.

A Labor Saver.

SPEAKING of household or labor-saving conveniences, the ingenious scheme shown in the picture may possibly interest some of our people. This was taken from "Gleanings in Bee Culture," and we understand it to be a suggestion for the man who does not like to bend his back and lift a heavy weight. The theory of course is that of the old-fashion well-sweep, where the weight on the end of



A "WELL SWEEP" FOR THE BACK.

the pole lifted up the water from the well. Our friend who is trying to lift the crate does not appear to be particularly happy over his invention, and he will probably take off the harness without giving it any further trial.

Baked Apple Juice—A New One.

I WANT to suggest to those who put up fruit and fruit juices for family use a new old substance that is of great value in sickness, and a nice beverage to offer in a small glass to your guest. It is simply the juice from baked apples put up like grape juice. Of course you will need a lot of apples, but you probably have a lot of unsalable seconds or thirds that would go to the cider heap otherwise. Select ripe sound fruit, small or specked it may be, since you are going to cut them over anyway. Such nubbins as an unthrifty Northern Spy tree will furnish by the bushel give just as nice juice as fair fruit. It will not be necessary to pare them, but no doubt they would better be cut, the juice will start better. If the inside prove sound and clean the core need not be removed, so it is but little work to prepare a bushel. Father or the boys will do it for you these long evenings after the chores are done, and they get their boots off. Take all your available "things" and fill the oven full. When well done put the pulp in a cheese cloth and hang over a dish just as would be done for jelly. No one who puts up grape juice will need more instruction. Use sugar if you want to, but it is good enough without and sugar is high. Give the pulp to the hens, though I, the man of the house, being fond of apple sauce, have sometimes dipped my spoon in and disregarding hulls and seeds have called it good.

The juice has considerable food value and is always acceptable to the invalid. Our housekeeper has sometimes fed almost no other nourishment to the sick one for a week at a time. Put up a lot of it. Take a bottle to your sick neighbor when you call and want to carry something nice. Use it with lemons and grape juice for punch for the picnic or surprise party, and ask your friends to guess what it is. I have looked for it on the exhibition table among the jellies and canned goods at the great apple shows on the "apple products" table, and never found it yet. Try it, everybody, and tell us through THE R. N.-Y. how you like it. U. L. R.

UTILIZE SMALL CARCASSES.—The Department of Agriculture is advising housewives in town near the country to buy mutton in quarters. Farmers' wives are advised to share sheep and lambs with their neighbors. This is good advice from every point of view. In the country the distribution of small animals in this way will give several families the chance to obtain fresh meat frequently, and they can obtain it in this way very much cheaper than they could by buying it in small lots from the butcher. At the same time it would be impossible for a single farmer's family to take care of an entire carcass before it would spoil. As for dealing with out-of-town housekeepers, we have found this season that there are a good many boarding houses or small hotels in many a country that will gladly buy half or even more of a small carcass. In the cool weather such customers can buy an entire lamb or a small hog well dressed, and cut the carcass up to suit themselves. In every town also where there is an organization like the "Housewives' League," it is possible to handle an entire carcass to good advantage, for the members will usually be only too glad to buy such a carcass at a fair price, cut it up to suit them and distribute the meat. We have been handling a good share of our produce in this way, and it has become evident that here is one good outlet for the farmer. We believe it will pay many a fruit grower to buy a small flock of sheep or lambs, feed them through the season and during the Fall and Winter slaughter and sell the entire carcass or a half at a time, to people who understand how to take care of the meat. Such people will be found in any town of fair size, if we will only hunt for them.

Baby's Winter Clothing.

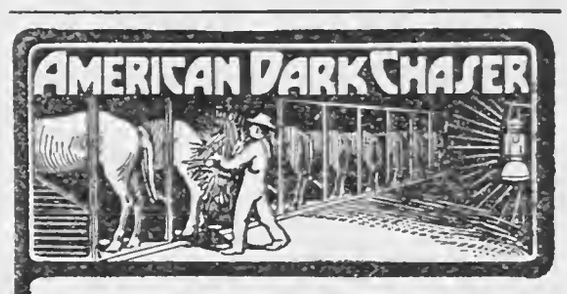
NO doubt every mother has solved the problem of dressing the wee girlie in her own way, but perhaps if I pass on some of the ideas I have picked up they may help some one a little. I don't find very satisfactory outer garments on the market, and if I happen to find anything really comfortable for severe weather the price is prohibitive. I think I hear someone say "wee girlies" should be indoors in very cold weather, which may be true in a measure, but the healthiest ones of my acquaintance are out much more than mine. Mine refuses to go out much alone, and I cannot always go with her, while my neighbor's little tots can play out indefinitely with their older sisters. They stand the cold much better than mine as a consequence too.

I buy the warmest underwear I can get, not the most expensive silk and wool grade, but the softest, warmest, wool with just a little cotton to prevent shrinking; even then it shrinks enough. This grade costs pretty well, but is infinitely preferable to doctors' bills, besides being cheaper. Then I make warm little woolen skirts and for cold weather will button them to substantial outing flannel underwaists with sleeves. Some people make these waists double, but I shall not. Last Winter we did not have the outing flannel waists, so I made outing flannel dresses, but gingham and chambray will be all right this Winter.

When it comes to baby coats, I invariably think of the man whose friend congratulated him upon the robust health of his little girl, but added: "I'm sorry to see *you* so delicate." The man replied in astonishment that he was perfectly well, but the child was not, whereupon his friend retorted that he only judged by the man's overcoat and the child's socks and short sleeves. If our Winter coats could be reduced to children's dimensions in all but thickness they would no doubt be very bungling, but we would surely freeze in a coat no thicker than the average child's cloak. For the first Winter I made my little girl a long full cape of eiderdown lined with outing flannel, and that had to be discarded, and I have just finished a new coat for this Winter. It is also of white eiderdown, lined with outing flannel, but I cut an interlining of cheesecloth, covered it with a thick pad of cotton exactly as for a quilt or comforter, and quilted it on the machine. It must be generously large, as it takes up a good deal in quilting. The coat is double-breasted and closes with a double row of big pearl buttons, four on each side. These were the only expense, as the eiderdown was given to me, but we buy it from mail-order houses at about 30 cents per yard, which would have made the coat cost less than a dollar, and I doubt if I could have found one so comfortable for a child of two years at any price. I shall make a little hat to match after the style of the boudoir cap. Cut a circle 18 inches across, line with something soft and warm, and insert an elastic draw string an inch and a half or two inches from the edge, leaving a full ruffle all around. For Summer we made one of lawn edged with embroidery, and my neighbor and I think them even cuter and prettier for the little tots than milliner's hats and bonnets costing several dollars. Mine for this Winter costs 34 cents which is about three times as much as I ever paid for my baby's headgear before; a little lawn hat costs less than 10 cents.

My baby always had ingrowing toenails until the doctor suggested shoes with extra wide toes, and I have had no trouble since. I know several mothers now who always buy them, and if all mothers did the babies' feet would be more comfortable. We consider comfortable clothing a real economy, because neither my husband's family nor my own is famous for robust babies, and if we dressed them as some people do we would employ a doctor or an undertaker, perhaps both. MRS. E. M. ANDERSON.

WHEN you write advertisers mention THE R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page.



The American Dark Chaser is a big convenience on the farm. Gives 400 candle power light. Stands all the hard knocks and burns brightly in all kinds of weather for less than one-half cent an hour. No wicks to trim or chimney to wash. Always ready for use.

The American Dark Chaser is a dependable lantern for the farm. Absolutely safe. It gives the farmer a practical and efficient means of economical light in a hand lantern.

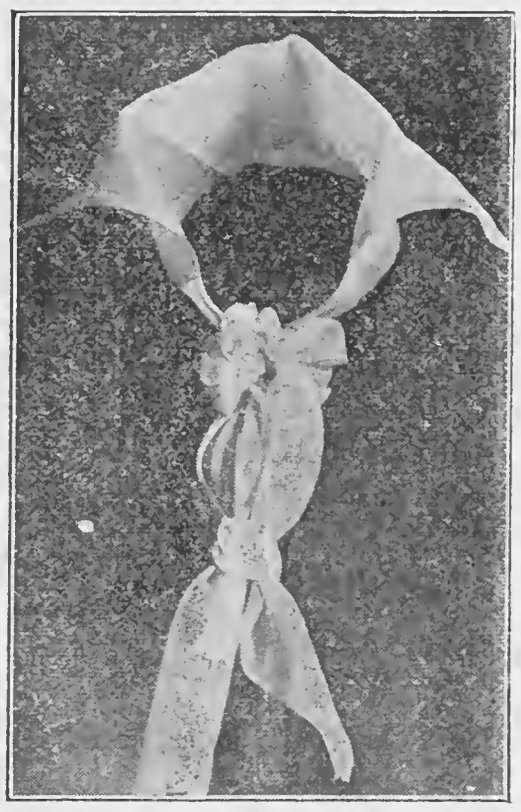
Good Dressing At Light Expense

Novelties in Neckware

By Esther M. Cosse

[NOTE.—Questions relating to dressmaking, millinery, fitting or caring for clothing or other matters concerning women's apparel will be answered by Miss Cosse. Send questions to THE RURAL NEW-YORKER.]

THE WELL DRESSED WOMAN.—While walking through the business section of a large city recently I met a woman who attracted my attention. She



THE KNOTTED SCARF.

was one of, what one might call, the best dressed women I have ever seen. Naturally I met that woman many times while in the same section, and after closely observing her my curiosity was aroused, since a friend accompanying me on several occasions, said she had never heard of a woman who spent so little on clothes. I was much surprised, since I considered her well-dressed and couldn't see how she could always look so well, and not spend much money. After a time I met this woman through a mutual acquaintance and it was the beginning of what I imagine will ripen into friendship. Since meeting her I have begun to study her and find that what my friend said about her is true. One day we met her, and she had on a very neat suit, shirt waist, and looked well dressed for the occasion. On the next meeting which was at a small social gathering, upon close observation I discovered she had on the same shirt waist and suit, but how differently she appeared. Shall I tell you what she did?

CHANGING A WAIST.—To begin with she had on the same waist, but the difference was that she had added what is being used this season very extensively, and called the vest. This was made of the same material as the suit, and trimmed elaborately with buttons of a lighter color. The waist had been changed by adding a little fluting around the neck, leaving it open at the neck, and a little ruffling sewed to the sleeves, which I noticed were rolled to the elbow, and she wore long gloves. This made a dress, and not a shirt-waist suit. When she went on the street another time with the same suit she made many changes by wearing one of the plain white organdie collars, but added to it a silk scarf, which had been tied as shown in illustration. But remember this woman was not a very large person, she was of medium height and was what one might term of slight willowy figure. She was a young married woman, but the same thing has been done for young girls, or for an older person of her type.

THE KNOTTED SCARF.—The scarf she used for her tie one day had been worn by her little son. It was scarlet, but before pinning it to the waist, she found the center of the scarf, tied two loops one and a half inch long, with a tight knot, with the ends she made a four-in-hand knot, then pinned the tie to her collar as shown in illustration. This made a most artistic decoration. Another day she used ribbon in the same way, and at another time the ribbon was merely tied in a sailor's knot. This made a change, since the colors were different each time, and it was an easy matter to find a piece of ribbon which was nearly a yard in length. For the larger woman this tie could not be used in the same way, since it would only emphasize her size, which we all are anxious to avoid. The tie could still be used, but it would be better to tie it in just the four-in-hand knot, and make it as long as possible, since it must fall below or to the waist line. What is better for the large woman to use is a flat bow.

A DAISY BOW.—The second illustration shows one that is very pretty, and can be used in any combination desired. The daisies are made of coronation or rice braid, generally using the heaviest which can be secured. They are made by wrapping the knots with thread to hold them in place, then making French knots in the center of embroidery floss. Take up two knots and twist thread about the lower part, just below the heavy part; take up two more until you have made eighteen petals for your daisy, then join them together and insert the French knots. Make the second daisy in the same way and join them together at the back. Take a piece of velvet ribbon six inches long and slip through these flowers. You can have any number of colors you wish and change very easily every time you wish to wear the bow, thus having any color that will harmonize with the rest of your costume.

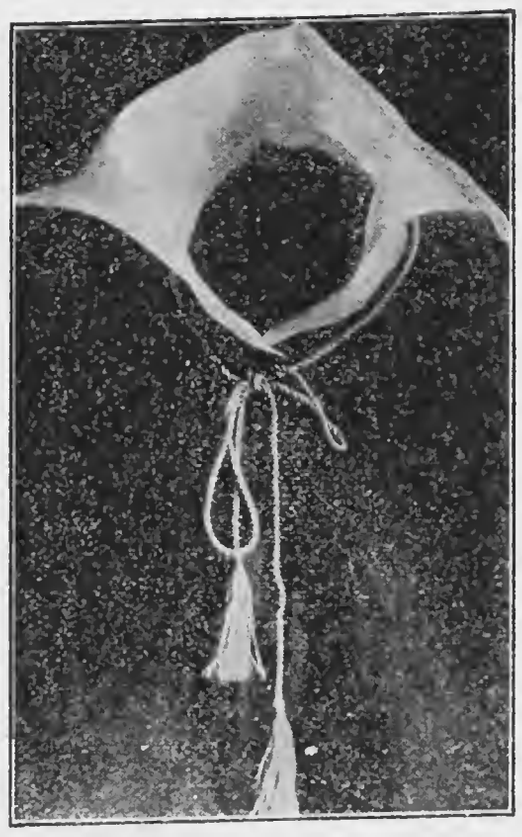
THE TASSELED CORD.—Still another decoration which can readily be changed at practically no expense is the

BOW WITH BRAID DAISY.

cord, which is used with the new collars worn this season, especially the Gladstone, or the soft lacy ones, which are used as a trimming for the fancy and plain dresses. These cords can be made at home, and of as many colors as desired. If one has ever used Royal Society floss No. 5, or D. M. C., for slippers, or any fancy work, no doubt she has some left over. If you would take two lengths of this floss five yards long you could make one of these cords. If you desire a heavy one take four five-yard lengths and make in the same way. After cutting off the lengths of thread, tie the ends together at one end, leaving the ends of equal length. Place knot between the thumb and third finger of right hand from outside, between first and second fingers and hold by thumb with knot. Take other piece of floss between third and fourth finger of other hand, put first finger of left hand through long loop over first finger of right hand and catch thread running to fourth finger of left and draw the end up with the right hand. Still hold firmly with the left hand and draw the end through with the right hand, and draw up in the same way with the left hand. This will give you a firm beginning, but if left to slip when starting the end looks loose, which if possible, must be avoided. Thus you continue to the end of the floss, alternating hands as you make the loops, always remembering to make loop with one hand and draw up with the other. When you have reached the desired length, slip one end through the loop and draw up and tie with other end. Then take a little more floss and wrap around three fingers 10 times, tie with a small piece of the floss through the center, which has been left on the cord when you broke off the floss. Fasten this securely, then wrap the top edge with the floss to give the tassel a good finish where it is attached to the cord. Then cut through the center of the wound floss and cut the ends for the tassel, making all ends even. Do the same with the other end. This is also suitable for the stout woman, provided she leaves it long and doesn't tie it too short.

OTHER VARIATIONS.—With the slender person all of her bows can be cut off short and still make her look well, while the tall woman can have nothing long, but everything must be short and broad. For instance, she can use the tie as shown in first illustration in a different form. She can have the bow tied much the same, but if the ends are tied in either a four-in-hand or a sailors' knot (made by tieing an ordinary double knot, but left loose) the tie must not be drawn down tight, but pinned to the waist after pushing it up about two inches. This will widen the ends, and make a broader effect. It is also well to have the loops made 2½ inches long, instead of 1½ inch. But the tall, slender woman should never wear one of the Gladstone collars unless it is made to roll and is wide, and the long narrow ones should be avoided. In fact, she should select the soft lacy styles, and then wear the colored neck decorations. If she is inclined to have little color the fancy neck pieces will give her skin a more healthful glow.

TAILORED BOWS.—The small tailored bows are still used extensively, and are especially suited to the person with a short neck. They are made of velvet ribbon, satin ribbon, and if one has not the ribbons, it is possible to make them of small pieces of silk. If silk is used, the strip must be one-eighth of a yard wide and 27 inches long. A double fold is made, since no stitches must show. The silk is folded to the center of the inside, then caught together with what has been called an ordinary cat-stitch, or a short stitch from one side of the seam to the other. When the piece is finished make a pointed end, then pin the silk in one end, one loop, then start from the other end and make the other end and loop the same length, and if there be a surplus, fold in evenly each way across the bow to form the knot. Take a needle and sew it together, not allowing any stitches to show through, but catching the loops firmly together then slip stitch the knot through. You will then have a tailored bow of silk. Of course if one has the velvet ribbon or a piece of satin ribbon, it is a simple matter to form one of these bows, but they must all be pinned together before any other part is sewed. Sometimes we have a few rosebuds left from our Summer hats, if such



THE TASSELED CORD.

is the case, sew them on a straight piece of ribbon, then to a safety pin and use that at the neck. Of course the pin must be sewed with the end which holds the pin fastened at the top, so the pin can be used to catch it to the waist.

:: Good Words ::

For the Boys.

I WISH I had the ability to write you the story of our decision to give up a city home and place our three boys here in the country the whole year round. Your paper has helped us make this decision, for it has the knack of accentuating and bringing to a focus the thoughts and aspirations which in our hearts we know are wise ones. We really feel grateful for the policy of the paper, and would miss it more than I can say, because of its great helpfulness on all points.

Maryland. MRS. GUION MILLER.

Friend and Guardian.

I WOULD like to say at this time that we consider your paper a real friend and guardian. Why can't more papers be edited in this real way? It must be a pleasure to publish such a helpful, clean paper, and to know that your subscribers back you up as yours cannot help but do. When people get to realize the real worth of THE R. N.-Y. to town as well as country people you will be overrun with subscriptions. Am very glad to send these few names, or to help in any other way. L. LA MONTAGUE.

Massachusetts.

I take this opportunity to tell you how helpful we find your paper. We not only keep it on file, but I have a little index book for my own use, so that I may be able to refer to special articles.

MRS. M. H. MILLER.

The Estate Manager.

I AM a comparatively new reader of THE R. N.-Y. I take 10 to 14 agricultural and pictorial papers, about one-half being farm journals. I consider yours to be the most practical, helpful, and at the same time interesting agricultural paper I subscribe to, and am only sorry I did not take it earlier. As superintendent on a large estate I find it of great value, and my advice to any friends needing the best farm paper is subscribe to THE R. N.-Y. WILLIAM N. CRAIG.

The School Teacher.

SCHOOL TEACHERS do not get their month's salary till about the first of October, and during the Summer money is at a premium. You may register me as another of your old cranky teachers who can't get along without your blamed old paper. G. L. C.

R. N.-Y.—No one will deny the fact that cranks make the wheels go round, and that teachers train those who work the wheels.

A COMMUTER'S STORY.—This is a commuter's section. The farms are mere residences, and the land lies idle to a great extent. Some have tried to make the farms pay the taxes and the interest on the investment, but have failed. I read THE R. N.-Y. for general information, and I enjoy it as well. I like it better than any other farm paper, for it more nearly gets down to the simple and practical. There are lots of people who come from the city and rent small places in the neighboring towns. They take a farm paper and start a small garden. This lasts for one or two years. The gardens are truly wonderful creations and illustrate how deficient trade papers are in those little details. One of your papers was given to me, and in it there happened to be an article in which the writer had omitted all "padding," but had given every little possible detail. I subscribed for the paper on account of that one article. S. L. S.

New Jersey.

A POLICEMAN'S VACATION. — I would not miss one copy of THE R. N.-Y., and I can hardly wait for the time to receive my weekly paper. I am a New York policeman, and after retiring, expect to go farming, and I must say that I received more valuable information out of your paper than out of all the farm books I have ever read, excepting books and bulletins from the Department of Agriculture. While on my vacation this Summer, visiting a friend, who is also a retired policeman, and also a subscriber to your paper, and in the poultry business, I received my first initiation as a farmer. I did all kinds of work a hired man would have to do, such as plowing, harrowing, milking, cutting brush, tying and setting up buckwheat, and corn, etc., and I found out that farming is no play, for my hands being soft, not being used to hard work, were full of blisters in a little while. But this did not discourage me in the least, and after two weeks' time I was well used to it, and hated to leave the farm, to get back to the city. I will say that this was the best vacation I ever spent in my life. E. M. G.

The Land of Fulfillment

A Story of Homesteading

By Rose Seelye-Miller

(*Continued from page 1065.*)

CHAPTER IX.

HE saw Nate's dark head upon the waters, his ghastly face and open, staring eyes. Norm poised the rope in his hand, which was as steady as death itself; he threw it, and it seemed to Norm that it had caught the boy, but with a gurgle of the demoniac waters Nate sank again—sank the third time, and the rope went trailing away over the waters.

Norm pulled and struggled at the rope, but it had caught, and Nate had gone down, down, for the third and last time. Was there no help? Was there no way to save his friend, his brother from this awful death? Norm still wrenched at the rope, but the weight that held it was beyond his lifting and he sprang on to a narrow shelving of the bank, ran back and with a mighty plunge, dived beneath the waters. They were black, and turbid and roaring, but still he sank beneath them, holding his breath and forcing himself along beneath the flood. Norm's arm struck against something that rasped and tore it, reaching to disentangle his arm, his hand touched something icy cold, and clammy as death, then something wet, like hair; with a joyous gripping he caught hold of that soft hair, and he held on although the weight seemed dragging him down so that he could not rise. Norm's chest seemed well-nigh bursting with his indrawn breath, but he knew that perhaps the life of both Nate and himself depended upon the holding of his breath for an instant more. He tried to loosen the lassoo from Nate's body, for it had really caught him, but he could not do it, and finding himself spent, and ready to collapse, he loosened his hold and swept to the surface, for a breath of air. He had kept hold of the rope, and driving the picket pin into the crumbling shale, he began to wind the rope in. It came very slowly and heavily, but it came, and Norm knew the precious burden that was weighting it down. Could he never get that body to the surface? Would it be beyond all hope, if he did? Wild thoughts flung through his brain, but Norm had not lived in a lake country for naught. He remembered well the resuscitation of one who had lain in the water more than an hour, and he had heard tales to the effect that persons who had been under water for many hours were eventually resuscitated.

Suddenly, upon the bank above arose the old familiar lowing of the oxen, and looking up, it seemed as though they had come in answer to Norm's prayer for help, but in reality, they had found the barn door open and had wandered out, merely to investigate this mild Spring morning. With a rush of joy Norm stormed up the bank, fastened the rope about the oxen, and giving them a sharp slap, bade them forward. The rope cut into the tough hide of the team, but still they went forward at Norm's cry of command. The rope was long—too long, Norm realized, but at last the oxen had drawn until it held taut against the shale bank, and could not be pulled farther. Nate's body had lodged, but Norm slid, slipped, rolled, fell down the slippery precipitous bank, followed the rope into the water, found Nate lodged against a shelf of shale, slackened the rope, and with a mighty effort pulled the boy out of the water.

Norm knew that it would be slow and difficult to carry his precious burden up the bank. He knew that every moment was precious, so steadying the inert form he bade the oxen go forward again, which they did. Long used to absolute obedience, slowly, but surely they drew the inert object at the other end of the rope up the embankment. The rope sawed over the edge of the bank, and Norm watched constantly lest the parting strands should break. At last the top was reached, and with a cry of joy, Norm lifted the limp figure in his arms, and carried him home. It had all taken but a few minutes of real time, but ages of agony had gone into it. Quickly he laid Nate's body over a chair and pressed the water out of the mouth and nostrils. He stripped off the wet clothing and wrapped the cold body, in blankets, yet warm from his own night's sleep. With a few deft movements, he started the fire, and swung the kettle in place, thrust some stones on to heat, and then began a systematic raising and out throwing on Nate's arms. How he worked, and how he prayed, and how he hoped that someone, someone, would come to his aid. How long Norm had worked he had no idea, but he was giving every ounce of himself to the resuscitation of his friend, and he was finding no sign of life, although he was bravely struggling to re-establish respiration. Perhaps it was no miracle that Jim Maynard arrived, and perhaps it would have happened so anyway, but "Halloo, You!" came Jim's voice and it sounded to Norm like the voice of an angel. "What on earth are you doing to Nate?" Jim gasped as he saw the ghastly object before him. Norm had not stopped to gather up his clothes and he was almost as wet as was Nate himself. "Here, let me!" Jim thrust Norm aside and began working over Nate. But only for a few moments did Norm acquiesce. He thrust Jim aside.

"Let me! I must!" he said brokenly. And Jim relinquished his place again.

"It would take hours and hours to get a doctor," Jim said thoughtfully. "But I'll send for one, and I'll get Hank Jones, he knows as much as two doctors and a few women besides. Then I'll see if that drunken Peters has any liquor, he went to town yesterday," and Jim was away, and in an incredibly short time Hank Jones, strong, gentle, and efficient relieved Norm. He was followed by many others, curious, anxious, kindly, for all wanted to help the boy, who had been well loved, the boy who had been helpful, a ready source of comfort in all sorts of difficulties, who had a mind quick and resourceful in all kinds of dilemmas.

"You fellows 'll have to get out," Hank Jones said quietly. "We must give Nate all the air, and all the chance there is for him." So mutely the men filed out again. Some wandered off to the barn and attended to the chores, while others simply stood about outside and waited, hoping there might be something they could do.

"You get some dry things on, Norm," Jim commanded, but Norm made no move to help himself. Someone thrust a cup of hot coffee into Norm's shaking hand, but he would not touch it, until Hank spoke:

"You can't keep up, Norm, for the sake of Nate, take something," and for the sake of Nate he did. And all three boys worked and worked and worked, yet no flickering eye lash, of the waterlogged body, gave evidence of life, and yet they worked mightily. After hours of work, raising and lowering that inert chest by means of artificial respiration, Hank paused a moment, and placed the slim hands upon the white chest. "I'm afraid—we've done—all—we can—" he said haltingly.

"Why you quitter," flamed Norm, "men are saved after being in the water for many hours—Nate was in only a few minutes. I'll never quit; I'll never give up until I drop myself." and Norm thrust Hank fiercely aside.

Hot water bottles, and hot blankets were being constantly placed about the boy, and much chafing of rough hands wore the skin almost from the cold arms and limbs, and still they worked. Suddenly Norm paused; suddenly, he almost sank to the floor. Did an eyelash flutter? Was there a slight beating of the heart? "Norm had watched so intently that he could not trust his sight, and he turned with pale lips to Jim who was standing near, and to Hank, who never for a moment relaxed his ministrations.

"He's—" Jim stammered and then he seemed to be trying to swallow his throat. Hank held a litle looking glass before Nate's mouth, and a slight film covered it.

"He—lives!" Hank could hardly enunciate the words.

"He lives. He lives!" the glad words flew from mouth to mouth, and many a young heart thrilled with the rapture of that moment. The boys who had been shut out so peremptorily that morning came edging near to the shanty, that they might just stand near. They would not shut off one atom of the blessed oxygen from those long dormant respiratory organs, but they stood ready to serve, and with uncovered heads as though the resuscitation of this almost drowned boy had brought them into that Presence which calls for reverence. Nate himself, breathing faintly, but yet breathing, was tucked into a bunk soft by the love of all those young homesteaders of the plains. Nate slept for long, his breathing gradually becoming stronger and finally he became dimly conscious. He half opened his eyes, to find himself in Norm's shanty instead of his own.

"Must have fallen asleep over here last night," he whispered, gazing curiously about. "I've dreamed of everything I ever did in all my life—I've done a lot of low-down things—but I'm going to be white from now on—I'm going—to—be—white," and with this spoken resolve Nate lapsed into sleep again. The watchers, smiled solemnly and a tear rolled down Norm's white face, but no one spoke—they were too full of unspoken thanksgiving for any words.

Nate did not waken again till midnight, and then he only roused a little to say worriedly," The chickens, Norm! There'll be a flood tomorrow—it's raining now—" then a pause—and he added "Hear it roar!"

"It isn't raining," Norm answered quietly, and he drew the curtain from the little window, to show the stars.

"The stars are shining—the stars—I—must have—dreamed—" and then he fell asleep quite satisfied.

The sudden rising of the creek caused much damage; bridges were washed away, railroad culverts washed away, but no loss of life ensued. Some six miles from the place where Nate had striven to rescue the chickens, they were found upon a little shelf of shale above the creek bed, washed there by a high tide of water, and left stranded when the flood had spent itself, as it did almost as soon as the creek itself became open and made a channel for the water. The chickens were safe enough, for they had kept on their perches, and the one who found them, fed and cared for them until they were called for.

With the sudden coming of Spring the young homesteaders were as busy as boys could be. Nate had rallied rapidly, and in a week he was as strong as ever, which bore high evidence to the benefit of his outdoor life and his simple, wholesome living in all ways. There was new machinery, and new horses and the farm work went joyously forward. But this year the rains did not come as needed, and the crops did not turn out as well, and yet, there seemed to be a steady advancement towards prosperity. Every expense was calculated, and every necessity rigidly brought within the bounds of the means they had to meet it. And so the days rolled on. The farm upon the creek bank had been a good investment for the boys, and yet—and—yet—

It was the fourth year of their homesteading, and the crop was the poorest they had ever harvested, and yet the crops upon adjacent land were good, and the grain plump and of good, clean texture.

"Norm," said Nate thoughtfully. "There's a big difference in the grain yield on our land, and on that of Jim's and Hank's and all the rest."

"Our soil is shallow, not deep enough for steady cropping," Norm explained. "Sometimes, I've almost thought, perhaps we did make a mistake in filing on this land. "I was so impractical then—" Nate mused—"But I've reaped the harvest I came for, and yet, maybe we would have done better had we done a little differently."

"Yes, we've reaped what we came to find—your health—you're as wiry as a corkscrew, and you're like one too; you always get a pull on what you're after, and you're always after something worth while. But there's no mistaking that the top soil on Jim Maynard's land is a hundred per cent better than that on ours, and yet our valley land is the richest I ever saw. If we wanted to farm on a small scale, and run the risk of a flood, we could raise big truck down there. But we've absorbed too much of the spirit of the country; we've got to spread out over a big space. I don't know as I ever go out into our fields that I don't dig down to see if I can't find a deep top soil, with a reasonable subsoil, beneath it—"

"And you find shale," Nate exploded.

"We've had a glorious experience anyway," Norm comforted. Norm struck Nate's chest with a resounding blow, "counting that into the profits of the adventure we have made good. You've got that filled out with the best air man ever had to breathe, and you haven't got glass eyes any longer. You're eyes used to look like glittering chunks of ice with a fire behind them. You're cheeks aren't painted every morning with a hectic rose, and you haven't any more cheek bones just now, than any other fellow who's as wiry as you are." As Norm enumerated these things, Nate's dejection swung away like a barn door in a high wind.

"I do forget sometimes—" Nate apologized. "But this bed of shale has been worth more than most folks see. We'll make good; we'll make better; we'll prosper."

"Of course we'll prosper; unless a man is quite a fool, he can't help but prosper here. If we can't raise wheat we can raise cattle—this is more a cattle country anyway—and after we get our patents on this land, we can go away or do anything we please, we are not tied here."

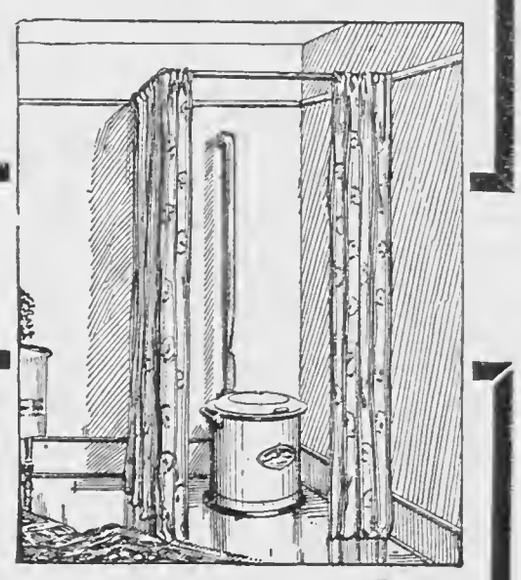
You've Needed One For So Long

—an indoor closet,—and at last it is possible for you to have one. Now you can be free from the discomforts, the inconvenience, the constant health menace of outdoor closets.



THE WATERBURY SANITARY CLOSET
ALL-METAL-CHEMICAL

is within your means. You need no sewerage connection,—not even a cesspool,—no plumbing, no installation expense of any kind. The price of $22.50 gives you a *complete outfit.*

You don't need an extra room. You can place it in any out-of-the-way corner. It is so inoffensive you can have it in any room, hallway or closet. We absolutely *guarantee* it to be odorless and sanitary.

If you can't wait another day for this long-hoped-for sanitary convenience, order direct from this ad. The Waterbury is guaranteed with a *real* guaranty, and a big, responsible, well-known company is behind it.

Write for our book tonight. It explains the construction and operation of the "Waterbury",—and how our chemical system does away with the big expense of sewer connections.

Holly or Mistletoe for Market.

EVERY year a great business is done at Christmas in handling holly and evergreens for decorations. Some of our readers are engaged in the work of gathering the holly and one of them tells about it as follows:

As I have been working with holly since a boy I am quite familiar with its gathering and marketing, which is as follows: A man climbs and starts cutting a well-berried holly tree at the top, and chops the branches as he comes down until all are cut, then the small branches are broken by men called breakers. They are broken in pieces from eight to 24 inches in length according to the amount of foliage and berries. Branches are held in the left hand, green side up until all that can be held are broken with the right. Then the handful is passed to the packer. He places the holly in layers until the case is filled. The case is made of seasoned pine lumber, surfaced one side, ⅜-inch thick, and is two feet wide and two feet deep by four feet long. The top is then nailed on, and the case is carried to the road or transported by team. The cost of gathering and shipping is as follows: The holly, 50 cents the case, empty case, 40 cents; breaking 33 cents; hauling to station, 10 cents; freight prepaid to Philadelphia, 38 cents; totalling $1.71, and a case usually sells for from $2.50 to $3. The transportation charge is for hauling to station within radius of two miles, and labor is reckoned at $1 a day. Holly cut in North Carolina and Virginia costs less, in view of lower priced labor and cheaper cases.

The holly wreaths are made mostly by women, almost all classes work at them. A switch or stick is cut 33 inches long. This is bent, allowing three inches for splice, and is fastened with wire, making a 10-inch hoop. Choice green holly is used, twigs with about three leaves are put on and wrapped with special wire made for that purpose, about every six inches. A nice bunch of berries is included, making a total of four or five on each wreath. These wreaths are taken up by teams supplied by dealers who pay from five to eight cents each for them, according to market prices. These are carried to the packing house and are packed in cases lined with paper, making the case as airtight as possible; air or light will soon fade them. They are packed 225 in a case, and lid nailed on ready for shipment.

Mistletoe is very scarce, and but very little is shipped. In cutting it, the branch on which it grows, the trees being maple and gum, are sawed off and lowered to the ground by a rope. In placing the mistletoe in case, care should be used to see that stick is as long as case is wide. A nail is then driven in each side of the case and in the end of the stick. This holds the bunch firmly. Six bunches usually fill a case, and sells for $4.50 to $5. Much care is needed not to break off the pearl-colored berries.

Delaware. P. L. HUDSON.

A Supply of Donkey's Milk.

ONE of my neighbors is very sick and would like to get donkey's milk, about two quarts. He thinks the milk will give him a new start. If you know where it would be bought would you let me know? J. A. F.

We have all kinds of questions and generally obtain answers to them, but this is a hard one. We find that donkey's milk is considered by some persons as superior to any other kind except perhaps goat's milk as a food for invalids. In Europe this milk is frequently fed as a last resort to weak children or persons who are wasted away with some lingering disease. After writing some dozen letters we have found several persons who have at this time jennets that are giving milk. R. H. Walter of Pennsylvania, has a five-year-old donkey, apparently flush in milk, and he knows of several others. This stock is used to produce breeding jacks and, of course, they are very valuable. Just how to supply the milk is a problem, too much for Mr. Walter and the other parties who tell us they have it. The patient might buy the donkey, which would cost him $300, or he could come and board near the farm where the donkey is kept, and thus obtain it. A few quarts of milk might be sent by mail, but, of course, there would be no profit in taking such milk treatment unless it were kept up for a reasonable time with steady

Business

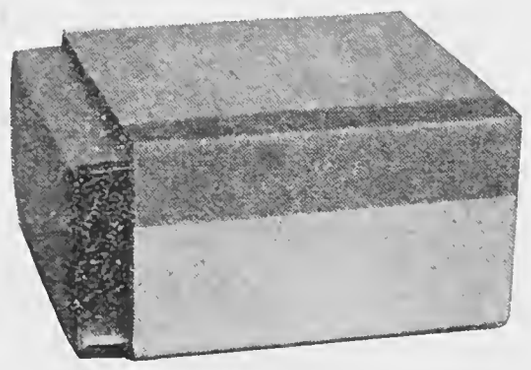
Farm Women As Earners

supplies of the milk. This question will give an idea of the way our readers rely upon our help. Among other information on this subject we have the following:

I can sure furnish donkey's milk, but never heard of its being used in sickness, nor in any other way only to feed young donkeys. Your reader can have it at $5 per quart. In order to secure it for him I will have to rob a valuable young male donkey! W. H. WHITTENBERG.
Illinois.

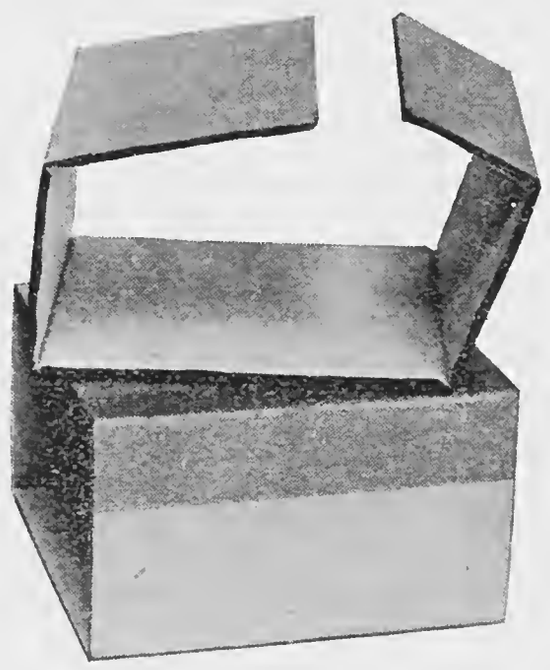
Shipping Butter by Mail.

THERE have been many questions from our readers about the practical wisdom of shipping butter by parcel post.



BUTTER MAILING PACKAGE CLOSED.

Many people seem to think that all forms of farm produce, from strawberries to cabbage, ought to be sent by mail, and many dairymen can see the great advantage which would come to them if it were possible to send butter in this way. Our advice has been not to attempt to ship butter by mail during the warmer weather in any event. We know of several



BUTTER MAILING PACKAGE OPEN.

cases where such shipments have failed, and naturally so, since an article like butter cannot stand up and endure the heat of a crowded mail car. During the past month we have spent much time in investigating this matter of butter shipment. The conclusion seems to be that in cold weather such shipments can be made where the distance is not over 50 or

THE BEGINNING OF PARCEL POST.

60 miles, and where there would be a sure and prompt delivery. Long shipments of butter by mail have not proved satisfactory. The butter melts, loses its shape and form, and in many cases leaks from the package and does not come in good condition. If provision could be made for avoiding warm storage rooms, or for leaving the mail packages close to stoves or steam pipes, the butter would go in better shape, but in the ordinary post office and mail car such precautions are not to be expected at present. The best package seems to be the one shown in the pictures. It is made of heavy cardboard, and as seen is a double package, giving the butter a double protection when fully packed. The five-pound package has usually gone through in the best condition. For shipment in this way the butter is made in the oblong pound blocks, thoroughly chilled on ice, then packed in parchment paper, and well sealed. These blocks are then put together and wrapped securely in heavy paper. This is then put inside the upper wrapper, shown in the picture, and this is pushed into the box with open ends, making the package as finally shown in closed package. This is then wrapped in heavy paper and properly tied up. Packages of this size and description have been sent successfully in cooler weather, and with care on the part of the mail carriers, Winter shipment of this sort would prove satisfactory. In the Summer, however, we could not advise shipments of this sort, and in the Winter with careless handling there would be serious trouble in many cases where the bags of mail are left in a warm place. The parcel post has not proved very satisfactory thus far for the shipment of these perishable products, largely because no provisions are made for handling them in special cars or hampers, where they can be kept cool. As the system develops, which it will do slowly, many of these objections will be overcome, but we must not expect at once to be able to ship strawberries, butter, or similar things in the same mail bags or cars with more enduring products.

Does Honesty Pay?

FOLLOWING our plan of printing new or singular business propositions we give the following this month. The ordinary college man who applies for a position of "manager" has a very good opinion of his own powers. Now the question is, will the "bluffer" really do better than the man who tries to tell a fair story about himself? The poet Whittier never married. It is said that he proposed to one young woman by mail and made the mistake of admitting his faults and leaving her to see his virtues. It should have been the other way—perhaps!

I am in a small dilemma. I have had two years' agricultural college training; have worked out successfully some of the theoretical laws learned in the classroom upon my uncle's farm. I had intended, when leaving college last Spring, to teach in a "prep" school this Fall. I have secured no teaching work, cannot return to college, and desire to go into managerial work. I have advertised in two prominent agricultural papers, have corresponded with several persons, but with unsatisfactory results. It seems to me that I must have told too much the truth; I wrote both of my failings and of my abilities, and tried to make plain just what I was not, so that I would disappoint no one should he employ me. Is it possible that I have said too much against myself? I know that the fellow who bluffs out a thing with the chesty "I-me-myself" stuff does get there often when the other fellow doesn't; but I do not wish to be that sort.

I wonder whether you can assist me. I am specializing in poultry husbandry; have successfully raised and cared for 336 chicks and 130 hens here; got highest prices for eggs and poultry, etc., and shown a good profit, as a side line experiment. Of course, I can do most other farm work decently, but poultry is my main post. I am also deeply interested in the run-down farm, and believe I would like to take the job of renovating and putting into profits some poor looking place. I can do it, too. I am careful, clean and systematic; do not smoke, chew or drink. Do these qualities command a good salary? I am no Sandow in strength, however, and though in good health, I am not extra robust. I have, as you see, no long record of work to recommend me, only what I feel sure I can do. I like to study best, but I am sincerely desirous to see the studied things worked out by my own hands in practice. P.
Maine.

A Public Refrigerator

ONE of the literary papers recently printed a picture of a large building at Cleveland, Ohio, part of which is a public cold storage. In theory the city offers to store perishable goods for all—dealers or housekeepers—for a reasonable sum. The plan is for a housekeeper to buy a crate of eggs, half a carcass of meat, a tub of butter or any other perishable stock when prices are low and store it in this "public ice box" until the prices rise. A number of Cleveland housekeepers express their views on the "ice box."

Auntie Cleveland goes to market,
Just to show that she is wise,
Saving money for her pocket,
Buys ahead a year's supplies.
Uses Mose's refrigerator
Puts them in when they are cheap,
Takes them out a few months later,
When snow makes the prices leap.

"Here is just how I can save for my Spring suit and Easter hat," one Cleveland woman may tell her friends. "I bought my Winter eggs, butter, apples and potatoes when the prices were way down. I placed them in the West Side Community Ice Box. I bought eggs for only 20 cents last April and May, and when eggs are 40 or 50 cents I'll be shocking my guests with expensive living, costing only Summer prices. Here again is where the ice box benefits us West Side people. We can put in nice fresh butter in June when it is the cheapest, and take it out a parcel at a time. We have just put in two barrels of apples, the 1st of October, we can keep those until May, have nice apple pies, when our neighbor across the street has to pay 50 cents a peck for them. Now, some of us people on the West Side don't have much to spare each week to buy ahead, and here is a plan some ladies have worked out. The woman clubs with friends, they buy a case of eggs, a quantity of butter, and produce and place it in the ice box. It doesn't cost much. A case of eggs is stored from May until January for 40 cents, a barrel of apples from October until June for the same amount, and the goods all come out fresh. Of course we are restricted in making too frequent visits to the storage, yet we are finding it so convenient and economical that women in other cities are taking up the matter. It was a little hard for us to understand the proposition but now every available space is occupied." Such a proposition ought to benefit direct trade from the country. City women can order in large quantities and store what they do not use at once.

High-priced Turkey Feathers.

IN the "Needlecraft" I saw an article stating that certain turkey feathers were used in millinery at $16 per pound, but did not find where they could be sold. I would be willing to send the editor enough for his hat if I can find a sale at that price. MRS. CHAS. E. BLAIR.
Vermont.

The feathers of turkeys and other barnyard fowls have for a long time been used in millinery, but the crude feathers are usually cheap. The high price mentioned evidently refers to the fluff at the base of some turkey feathers, which is manufactured into some forms of hat trimming and imitation marabou scarfs. The only manufacturers we know about who would be likely to buy the feathers direct from the farm have so little capital and poor business standing that it does not seem safe for outsiders to send them goods. Many poultrymen send the feathers to the same concern that handles their dressed poultry, the quills and wing feathers being kept separate from the others. Feather buyers come around the commission houses and take what suits their purpose, but no fancy prices are paid. That is the result of manufacture.

FIG PRESERVES.—In making fig preserves, our way is not just like all people do, but will state it, as some folks might be interested: Use good ripe and perfectly sound figs, stems on. Soak in strong lime water for about two hours to harden. Take from lime water and wipe each fig with a soft cloth to clean and remove surplus lime water. Put in preserving kettle and add sugar, three-quarter pound, to each pound of figs, and slice about one lemon very thin to the gallon and put in. Cook until the syrup is as thick as desired, skimming all scum that rises, and by the way the trace of lime left on the figs clarifies the syrup more thoroughly than one would suppose.
M. A. P.

How the State Education Department Can Serve the Rural Community

THE LOVE OF BOOKS.—"The place to form intimate companionship with real books," says Samuel McChord Crothers in a recent article, "is in the home. Happy is the child who has made the acquaintance of books that have been his father's and his mother's friends. They will always hold a peculiar place in his affections. As the years go by he will make new friends, and so the circle will be enlarged, but he will never forget those that have been 'in the family.'" If you will go into the children's room of any public library either in a city or a small town you will see many joyous youngsters poring earnestly over fairy tales, stories of adventure or whatever most appeals to them at the moment, and you will go out saying, somewhat as Mr. Crothers has, "Happy is the child who may browse undisturbed in a public library." The University of the State of New York believes that every child as well as grown-up has the right to know good books. With this idea in mind the Department of Educational Extension determined to extend library privileges to those who live in the country, especially those far removed from such privileges, and in 1891 the first traveling library was sent to Charlton in Washington County.

TRAVELING LIBRARIES are small collections of books which will be sent to any place in New York State, preference being given to places where it is difficult to provide good books for free circulation. Perhaps the most useful variety is the library of 25 volumes for general readers. These libraries contain books on all subjects, and are made up in fixed groups, or according to the wishes of the borrowers. As one of the librarians remarked: "They are a mighty good-looking lot of books, too." On application, lists of these books will be sent to any tax-payer. There are special lists for adults and for children, and one may have a combination of the two if desired. The conditions for obtaining the books are very simple. Application must be made by five taxpayers on a blank which will be furnished on request. Twenty-five volumes will be sent free, transportation both ways paid by the State and an oak bookcase furnished if needed. When more books at a time are wanted, a fee of 50 cents is charged for each additional 25 volumes. These books should be kept at some convenient place which must be open for free circulation during not less than three hours each week, with due public notice. If any group of taxpayers is interested in a special subject, such as agriculture or transportation, a library on that subject will be made up. These libraries may be kept six months and then exchanged, so that one may always have a supply of good literature on hand. There is available also a limited number of books in Italian, Polish, German, French, Hungarian, Spanish, Danish and Swedish. Additional purchases will be made as funds permit.

A HOUSE LIBRARY.—Suppose you live too far from any community center to obtain books easily. Why not send for a House Library? These consist of 10 volumes which will be lent for three months for a fee of $1, with the privilege of renewal for three months for 50 cents additional. Any two or three neighbors may pay the fee together and share the books. Either send for the catalogue and select the books you wish, or inform the Division as to the ages and tastes of the readers, and leave the selection to the librarian.

THE STUDY CLUB.—An interesting feature of the Winter life of many small towns is the study club. The Division of Educational Extension registers those which agree to carry out an approved course of study and assists them in preparing programs and by lending traveling libraries, pictnres and lantern slides. A fee of two dollars is charged for any library lent to clubs, Granges or private schools, so that the use of the books may be restricted to their own members. Requests for application forms and additional information will always be promptly answered, as the Department is anxious to extend the work as rapidly as its means permit. In the famous fire in 1911 50,000 volumes were lost. Perhaps it is more interesting to know that more books from this department than from any other were saved because 45,000 had gone traveling.

VISUAL INSTRUCTION.—Working with the Department of Educational Extension and of scarcely less importance is the Department of Visual Instruction. This Department will loan lantern slides and photographs on a great variety of subjects, and to schools and libraries wall pictures. The State pays transportation both ways. These lantern slides are interesting to young and old. They are useful in connection with school work or study club programs, or to illustrate lectures. If any minister or school teacher wanted to give a series of lectures during the Winter—and why shouldn't he, using the schoolhouse as a "social center?"—the Department would help him by sending reference books and the slides with directions as to their use.

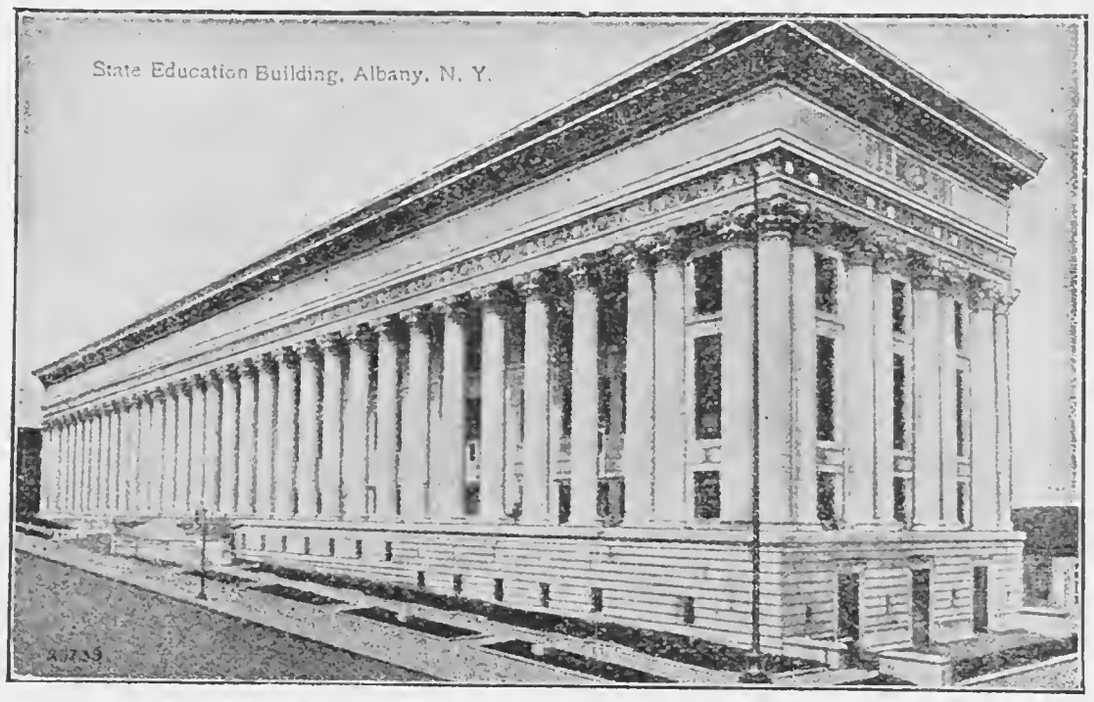
"The chief difficulty in helping people in the rural districts," says Mr. A. W. Abrams, who is head of this Department, "is that they do not tell us definitely enough what they want, and that they lose the catalogues." The catalogues are not printed annually and the supply, since the Education Department, like other people, must live within its income, is somewhat limited. Mr. Abrams suggests that some one person in each community, perhaps the secretary of the local Grange, shall make himself thoroughly familiar with what the Education Department can do for country dwellers, and keep on hand a complete file of all the catalogues and handbooks issued by the Department. If these could be kept at some central place, where interested readers could consult them it would greatly aid the Department.

THE REFERENCE LIBRARY.—Something new is Reference Library, which is proving of great help to High School girls and boys and to debating societies is the Debate Collection. This material is intended to supplement what is in the public and school libraries of the State. It consists of newspaper clippings, magazine articles, pamphlets and books on timely subjects which will be loaned for four weeks, with the privilege of renewing for four weeks unless the material is needed by other debaters. The borrower pays postage. A few of the subjects suggested for 1914 are Reserve Banks, Marketing Produce, Workmen's Compensation Act, Parcel Post and the Currency. The Reference Section of the Library will answer inquiries by mail concerning the books and manuscripts in its possession, and will send lists of authoritative material on any subject within its scope. It will also look up particular facts in history if the question does not demand extended research. A handbook describing its work in detail will be sent on request.

BOOKS FOR THE BLIND.—Of special interest is the Library for the Blind. This collection contains over 3500 volumes printed in embossed type. It includes text books and music, periodicals and general literature. Any blind reader in the State may borrow from this library without personal expense, the books being carried free in the mails. Through a special appropriation the library is able to add a few titles each year to the number of books printed for the blind. Of the 96 books so printed all are in New York point, which is the type of the greater part of the collection, and the one taught in the New York State Schools for the blind. American and English Braille, line letter and Moon types are, however, fairly well represented with over 1000 volumes.

EXTENT OF THE WORK.—Last year 1114 traveling libraries and more than 200,000 lantern slides were sent throughout the State, chiefly to rural communities. The library answered several thousand inquiries by mail. Other people are taking advantage of what the State can do for them, why should not you? If you have not already used the resources of the splendid new Education Building which really belongs to you, do so now. Send for a traveling library, give your children a chance to make friends with really good books in their own home and you will help the little traveling library to realize the dream of Mr. Melvil Dewey, formerly State Librarian, and his co-workers who set it in motion.

MARY BILLINGS EDDY.



STATE EDUCATION BUILDING; HEADQUARTERS FOR LIBRARIES.

Splendid bargain for every woman

The handiest garment to have in winter and most convenient on chilly spring and fall days. This excellent sweater coat is made of worsted and cotton, more serviceable than all wool. Has wide double ruff collar, reinforced seams, double cuffs, two side pockets, double border. Medium heavy weight. Sizes 34 to 44. No. 39E572, Maroon; No. 39E574, Oxford; No. 39E576, Tan. State Number, size and color. *Price, prepaid* . . . **$1.49**
Cannot be duplicated elsewhere for less than $1.75.

--of "Your Bargain Book" for many other equally attractive values in sweater coats, and the other 1185 pages for sensational bargains in *everything* needed for farm use, personal use or for the shop. If you haven't a copy of this great mail order catalog, by all means send in your name and address on a postal for your copy at once. We gladly send it free.

We pay all delivery charges on all merchandise shown in the first 454 pages of "Your Bargain Book" wherever you live. We also pay freight on 100 pounds or more in many states, and part of the freight in many other states on practically *everything* in our book. Read all the facts about our liberal free delivery offers on pages 2 and 3 of "Your Bargain Book". We guarantee quickest delivery, newest styles, personal attention to your order and courteous treatment of any letters you may send us. Write postal now for your free copy of this great money-saving catalog.

Live Stock and Dairy

FARM STOCK BREEDING.

PART III.

HORSE IMPROVEMENT.—In breeding horses, there are many points which are not given much attention with other classes of live stock. The kind of horse which is bred and raised is so largely dependent upon the conditions which the horse fulfills on the farm that the horse breeding varies according to the needs of the locality or farm. In a grain farming community, while stock kept is very limited, yet good, heavy horses are in demand. Necessarily, the type of horse bred for this work will be far different from the horses which are bred in a dairy community. When most of the work is such light work as cultivating and delivering the products of the cows, a heavy horse is at a disadvantage because the same traveling on the road that would ruin the feet of a larger animal will do no damage to the feet of a lighter animal. Probably from 1,100 to 1,350 pounds would be about the weight of horse desired under these conditions, while for the heavier work, one would want teams weighing from 2,800 to 3,400 pounds. While it is true that the market uses a certain quantity of light horses, yet the great demand is for a heavy horse with good feet to be used for trucking purposes in the cities. For the lighter work, automobiles can be used more economically, but when it comes to the heavy trucking, the heavy horse is often preferred to the automobile truck. Light horse breeding is not an industry which belongs with farming.

BETTER HORSES ARE NEEDED.—The need in most localities is more and better horses. If one has them to sell, they are always eagerly bought, and the market will probably be good for a great many years. It was prophesied before the European war that the price of horses would reach a low ebb during the next 10 years, but the experience of the horse market at present should lend itself strongly towards encouraging the breeding of good horses, for of all industries represented in our leading centers of business as well as in rural centers, the horse industry suffered as little as any. There are many reasons why the need for purebreds will not be satisfied in the present or ensuing decade. One ought, other things being equal, to select the breed which he prefers, as long as he is breeding along lines which insure uniform results. The one feature which draws strongly in colts, is the uniformity of one's offerings. If the colts are uniform in conformation and color, it shows the intentions of the owner in his breeding practice, and to breed aimlessly is almost, if not quite, as bad as not to breed at all. If one breeds along the lines of his preference, he will take more interest in his operations and be more likely to get better results.

PUREBRED SIRES ESSENTIAL.—If one be breeding either light or heavy drafters, purebred sires are an essential. Before one breeds to a purebred even, he should be reasonably sure that the stallion is free from diseases and hereditary weakness. Such hereditary weakness may take the form of a poor quality of bone, defective eyesight, or flat feet, etc. One of the important assets of a market horse is good feet. The sire should be well proportioned and not too heavy for his bone. Good breeders like to see a stallion's weight come from bone and muscle, not from fat. Some comparatively light stallions are made to seem heavy by feeding a large amount of corn; this is especially true where corn is grown. Such feeding not only deceives those who are judging the animal but also injures his breeding powers. The same corn which is so valuable in fattening steers or lambs for market does not add to the quality of the horse nor to his weight of bone. It is a poor feed for breeding horses. There is nothing better for stallions than good, clean oats.

THE LIGHT HORSE.—Should a farmer prefer to breed lighter horses, the Suffolk and Percheron are the most desirable. I have reference to the old style Percheron of the conformation and weight general to the breed before the infusion of the blood of the heavier breeds. These Percherons weigh from 1,350 to 1,500 pounds and the old Percheron owners used to make their brags that their horses could travel all day at from 10 to 12 miles an hour. When one is selecting animals for breeding purposes, look for an active, animated appearing animal with good action. The special qualities which the market lays the most stress upon are a close coupling, broad chest and loin, a well-formed neck and shoulders, well muscled but not fat quarters, strong in the stifle, with clean flat bone and sound feet. Of these the most important are close coupling, strong in the stifle, and sound feet. The horse with a long coupling is rarely a heavy hauler, while the strength of the stifle is insurance against some of the accidents to which horseflesh is heir, the great majority of which are in the hind legs. For heavy work on the cement or brick pavements or macadam roads sound feet and hoofs are demanded.

When using such a stallion upon a grade mare, she is almost certain to produce a good colt. Excellent general purpose horses will usually result from such a mating, especially if the mare is a little lighter and has some trotting blood in her. Should the mare be weak in any particular such as weak feet or bone, she would best be bred to a stallion in the neighborhood who is especially strong in these characteristics. If a choice is to be had, and it usually is, use the strongest bone. This does not mean, however, to use the stallion having the coarsest bone.

GOOD SUPPLY OF FARM HORSE POWER.

"FEATHERS" ARE UNDESIRABLE.—For the heavier breeds of horses, stallions from the English Shire, Belgian, or Clydesdale, may be used. The Belgian seems to be the most in favor in the United States to-day because of his good quality of bone and freedom from "feather," which is so much in evidence on both the Clydesdales and Shires. The United States markets discount rather heavily this large amount of "feather" which is the term used to designate the long hairs starting out at the knee and extending down to the fetlock joint. It is generally accepted by breeders that this feather indicates the class of bone which it covers. If the hair is soft and silky in texture, yet fine, it is taken as a corollary that the bone under it is dense, hard and clean. The converse is also thought to be true. If these suppositions are true, should the limb get injured, it would heal very slowly on a horse whose "feather" is coarse. However good an indication the "feather" is of the bone which lies under it, American breeders do not like it. Only 98 Clydesdales were imported into the United States in 1913, according to the 1913 yearbook of the Department of Agriculture. For some years back the American importers have been asking for a horse with fewer hairs on the legs, but the Scotch breeders paid no attention—they went right on in the old way without heeding the demands of the importers. Had they started breeding Clydes with small or no "feathers," the demand would be just as strong for them to-day as it ever was. Another weak feature which the Clydesdales as a breed have is a long coupling. Most of them wabble as they walk and such a gait usually goes with poor hauling ability.

SUIT THE STALLION TO THE MARES.—In selecting a sire to use upon farm mares, it is well to be careful not to get too far away from the type which the mare approaches in her conformation. While it is necessary to establish uniformity in the horses, this uniformity cannot be reached by even a single cross or two. It is a thing to be striven for rather than to be possessed. There are some mares in teams that could not or should not be mated to the same stallion. Common mistakes in everyday breeding practice such as breeding small mares to very heavy horses, breeding mares noticeably weak in certain parts to a stallion weak in the same particulars, all tend to prevent any chance of uniformity. Each colt from such a cross is an accident, and two that look and are alike only happen once in a while. It is well to study the mares and decide what kind of stallion to use with each one, giving proper consideration to her weight, apparent breed, conformation, energy and disposition. The best colt I ever saw was foaled about one-half hour after the mare was unhitched from the plow. I believe the mare should be expected to do her share of work up to within two weeks of foaling, and commence at light work two weeks afterward, always protecting her against severe strains or slips. Steady work is good for mares otherwise well cared for.

MARKETS PAY WELL FOR UNIFORMITY.—Breeding horses on the farm can be made a paying business by keeping two teams of brood mares to do the work, and breeding them to a good stallion each year. Probably mares weighing from 1,100 to 1,300 pounds are best suited for this purpose. For the breeder, however, the mares should be grades at least, of some good breed such as the Percherons. The "why" of the mares being grades is because the offering of colts will be more uniform and a well-matched team will bring from $150 to $200 more than the same team, not matched. Such a sum as that is worthy of notice. Such mares might be bred to a purebred stallion of one of the draft breeds, preferably the same one as the mare. The colts from such a mating would match up well and bring a good price. A well matched team of heavy draft type always commands a good price, and their mothers, while doing the work on the farm, would furnish the basis for two such teams each year. The cost of raising such matched colts is no more than that of raising scrub colts

This is a Milk Factory

This is a Power Plant

Your cows will give more milk, your horses do more work, and both keep in better condition, when you cut down their high-cost, war-priced grain and chop feeds and substitute lower-cost

XTRA-VIM FEED

Pure Porto Rican cane molasses and sphagnum moss combined in a new, clean, handy, dry form. Practical stock feeders have proved the high feed values and good conditioning qualities of this combination for all kinds of live stock. Animals love it and thrive on it—make more weight, give more milk, do more work. It is a cheap feed, for it takes the place, weight for weight, of higher-cost feeds, such as corn, oats or chop. Dry to the touch—about like bran—no waste in handling, and eats up clean without "mussing" animal or manger. Try it and watch your animals improve!

(In 100-lb. Bags)

THE RURAL NEW-YORKER,
333 WEST 30th ST., NEW YORK.

A New Jersey Pound Master.

WILL you tell me something about the compensation of a pound master in New Jersey? Who pays him and what is a fair charge for keeping straying live stock in the pound?
New Jersey. L. C. M.

I communicated with the Attorney-General at Trenton, and submit a copy of his reply. While this does not state appropriate charges or fees, it fixes such responsibility with the township committee.

I have examined the Township Act of 1899, which is still in force in this State, and which is to be found in the Session Laws of that year, on page 372. The same act will likewise be found in the Compiled Statutes of New Jersey. Sec. 4 of the act provides for certain elective officers, among whom are "so many pound-keepers as shall be deemed necessary." Sec. 32 provides that the township committee shall have power to make, amend or repeal ordinances for the several purposes therein named, one of which is to fix the annual salary or compensation to be paid to each person elected or appointed to any township office, except members of the township committee, and the manner of the payment thereof. This section provides that the salary of compensation when fixed by ordinance, shall be in lieu of the fees or compensation otherwise provided by law, and that the said fee or compensation shall be collected into the treasury of the township for its use. Under the circumstances, it is clear that the pound-keeper is an elective officer, and that his compensation is to be fixed by the township committee, under Sec. 32, which compensation shall be in lieu of all fees provided by law.

Ordinarily when live stock is running at large and trespassing, and is taken up by the authorities, the following charges would be reasonable: For horses, 75 cents per day, or $18 per month; for cattle, meaning mature animals, 50 cents per day per head; for sheep or swine, 25 cents per head, per day. In addition to such maintenance charges, it would be appropriate to charge the owner the actual cost of collecting the animals and if damage is wrought from the trespassing, this should be appropriately provided for under separate charged of damage. F. C. M.

How Butter Making Pays.

"IT pays me better to make butter, than to take my milk to Borden," is the opinion of William Winnie of Otsego County. "It is two miles to the station, and I took my milk there for two years from my dairy. I became tired of making the trip, it divides the day, and interferes with a systematic program in farm work. Now I separate my milk at the barn, we churn in the house, in the Summer in the cellar. We keep everything in good order, and would have nothing to fear from inspection should we go back to Borden's, but we would lose to go back. I am now able to raise hogs and calves on the skim-milk, I receive about as much from my herd by making butter, the work of making butter is no greater than the monotonous trip morning after morning to town. I have skim-milk which I consider worth $10 the cow the year for feeding on the farm. I milk from 12 to 20 cows, and the value of this skim-milk in dollars and cents looks good to me. I have local demand for part of my butter, part goes to Binghamton, and I receive 33 cents the pound. My herd consists of Guernseys and Jerseys. There are many farmers who could profitably do as I am doing, and there would be more dollars in dairying. I would say measure up to milk inspection, add a few more dollars in the equipment, then produce butter, it will pay."
W. J.

THE Nebraska Experiment Station, in experiments on cost production of baby beef, shows that Alfalfa, silage and corn produced the fastest and most economical gains, giving the most profit the calf. It showed that silage had a much higher value when fed in rations in connection with Alfalfa than without. The ration of Alfalfa, prairie hay and corn was second in economy. Two rations containing Alfalfa gave much better results than any ration not containing Alfalfa. The profit the calf from the lot fed Alfalfa, corn and silage amounted to $22.21 the calf, while the next ration in economy netted a profit of $20.28. The lowest in profit was from prairie hay, silage and corn, with profit of only $11.77.

Bulletin No. 242 of the Wisconsin Experiment Station is an excellent discussion of pork production in Wisconsin. In 35 pages it gives a very good statement of the important things in keeping hogs. There are pictures showing the kind of hog to raise, the best way to house them, fences, and the other important things which a farmer will need to know about. There is a discussion of feeding, which is very useful; in fact, the entire bulletin is just what hog breeders want to know, as judged by the questions which constantly are sent to us. We should think this bulletin would be of very great interest to all who keep hogs.

The Jersey

The State Dairy Instructor of the State of Maine recently said:
"One of the mysterious things about the dairy business is that a man can conduct a dairy all his life, losing money, and yet make a living."
But why run the dairy at a loss or to "make a living"? Why not make money?
By discarding "scrubs" and boarders and keeping the profitable Jersey the dairy farmer can do much better than merely make a living. Think it over. If you want to know what keeping Jerseys means, we have a good free book for you.

RAISING HOGS WITHOUT MILK.

CAN one raise hogs as a paying investment without feeding milk in some form? If so, what food can one feed to fatten hogs and what food should one feed a sow with pigs? What breed will give the best financial returns? L. H. C.
New York.

It is possible to raise swine at a profit without the use of skim-milk or buttermilk. Dairy by-products are useful in swine feeding, due to the protein that they contain, and to the further fact that milk is palatable, easily digested and otherwise adapted for use for growing animals. Especially is milk useful for young pigs five or six weeks old, for its use enables the youngsters to wean more easily and to grow a frame of substantial form.

Digester tankage or oil meal supplies protein in the most desirable form for swine feeding, especially if they are used as a supplement to corn. In the absence of skim-milk the following ration would give good results for young pigs of the age noted: 100 pounds red dog flour; 50 pounds sieved oats; 10 pounds digester tankage; two pounds bone meal. This should be mixed and fed in the form of a thin slop, the consistency of which was similar to that of buttermilk. They should be given relatively small amounts of this mixture, and required to clean out with avidity the trough promptly at each meal. As they increase in size and vigor, a small amount of soaked shelled corn could be added to the ration. Care should be exercised to soak the corn not more than 12 hours before feeding, and to practice the same means of keeping the edge on the pig's appetite as suggested with the slop mixture. We have found it a very great advantage to use forage crops as a source of succulent feed for brood sows nursing pigs. Alfalfa, rape, Soy beans, Red clover, oats and Canada field peas, or combinations of these crops, supply excellent sources of feed. In addition to the forage crops we have used to advantage the following grain mixture: 100 pounds ear corn; 40 pounds red dog flour; 10 pounds wheat bran; 10 pounds digester tankage; two pounds bone meal; one pound salt; 10 pounds oil meal. The corn may be fed in the form of meal, but there is no advantage in grinding or preparing corn in any way for swine. The balance of the feed suggested should be mixed and fed in the form of a thick slop, about the consistency of buttermilk.

It is always good judgment to arrange trough room, so that the pigs as soon as they are old enough, can partake of the same feed mixture as their mother. When they are six weeks of age, a creep should be provided where the pigs can run to a trough inaccessible to the mother, where the same feed, reduced however, by the addition of water, is available. Neither the brood sows or the young pigs should be given more than they will eat and clean up with relish at feeding time. Indigestion, scours, thumps and other disorders are the results of over-feeding, accompanied by inactivity.

When the pigs reach the weight of 50 pounds their ration can be changed to the following mixture: 100 pounds red dog flour; 100 pounds ground oats; 100 pounds cornmeal or shelled corn; 50 pounds wheat bran; 20 pounds digester tankage; 10 pounds oil meal; five pounds bone meal. This should be continued, supplemented perhaps, with a little ear corn, until the animals weigh 125 pounds, at which time they should be fed exclusively ear corn and digester tankage, utilizing 10 pounds of the 60 per cent. tankage for each 100 pounds of corn fed. The tankage may be reduced to 5% when the animals reach 200 pounds in weight if it is intended to dispose of them when they weigh 250 pounds.

As far as the breed is concerned, it is possible to find most excellent individuals in all the recognized breeds, and one's success in pork production does not depend upon the breed selected, but rather the type of animal selected within any given breed. There are two distinct types of swine, the fat hog type, and the bacon type. The former is represented by the Duroc Jersey, Berkshire, Poland China and Chester White, while the latter is represented by the large Yorkshire and Tamworth. There are a number of breeds intermediate, but those named in the largest numbers in our pork producing sections. Profits in swine depend upon a number of factors; prolificacy, extreme weight for age, quality, vigor are among those of the greatest importance. The use of home-grown feeds and forage crops are essential if one is desirous of the most economical gains. Animals thus cared for are more resistant to disease and make their gains with the most rapidity and at the lowest cost. F. C. MINKLER.
N. J. Experiment Station.

AILING ANIMALS.

Swelling.

A WEEK ago we turned our cow on wheat stubble and began feeding her lightly on rutabagas, tops and all. A couple of days later I noticed a swelling on her side quite low down, which is hard. Her navel is also swollen but very soft, feels as if it had water in it. She eats as well as usual, is in good flesh, and gives nearly four gallons of milk; freshened three months ago and will freshen again in the Spring. There is no veterinarian near and she is our only cow. F. K.
California.

The swelling may be due to horning and an abscess may be forming. The swelling of the navel may be incidental and will be likely to subside when the other condition disappears. Bathe the parts twice daily with hot water and swab the hard lump with tincture of iodine. If it softens the pus will have to be liberated. It is not a case for which we can confidently prescribe without making an examination. A. S. A.

Rheumatism.

I HAVE a hound which has rheumatism: it gets worse before rain, and seems to be all through him, and through his chest. What can be done for it? A. M.
West Virginia.

Give the dog five grains of salol in a capsule night and morning, and if necessary increase to three such doses a day. If the pain is very severe at any time give five grains of aspirin and repeat every four hours until pain subsides. Rub swollen or stiff joints with oil of wintergreen once a day. Keep him out of wet and cold. The bowels should be kept active. A. S. A.

Thoroughpin.

I HAVE a colt about six months old which has for the past two months been bothered with a thoroughpin on the joint of the rear leg. We have had her examined by the local veterinarian who said that the lump could only be reduced through the use of some imported medicine, at present not obtainable. Could you suggest any remedy, if any exists? J. F. K.

Persistently use a commercial absorbent if lameness is not present. If lameness is present better have the veterinarian line-fire and blister the hock joint. We do not know what medicine he has in mind. Such cases are not promising, but the absorbent or an iodine lotion may do some good if patiently used. A. S. A.

Warts.

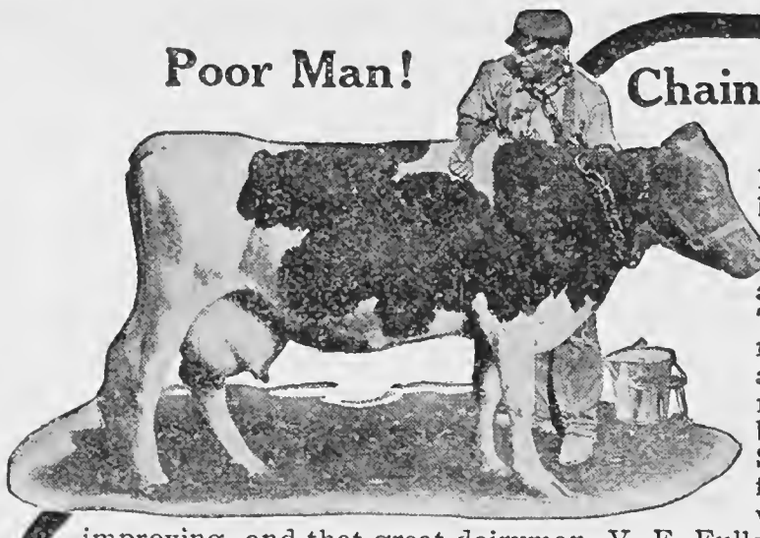
I HAVE a yearling steer which has warts on the back of his head and on his neck; some of them are three inches over, or more, and others stick out half a finger's length. He twists them so they bleed, and is not doing as well as the others. Can you tell me how to cure him? E. W. H.
Ohio.

Twist out the large warts and then stop the bleeding by applying a hot iron, or Monsel's solution or powder. Small warts in masses will disappear in time if you rub them freely with best castor oil once or twice daily. Feed roots or other succulent feed, or flaxseed meal or cake and he should soon pick up, if well fed on other nutritious feeds. A. S. A.

Fits; Rat Virus.

WHAT was the trouble with a three-months-old pig, which began suddenly to jump into the air, and shake his head as though taken with fits? It was hard for him to breathe. He died in about five minutes, bloated considerably. I thought perhaps it might be cholera, although the disease has never been known on the island where my farm is located. 2. Where can I purchase rat virus? C. E. S.
New York.

1. The fits were not due to cholera, but to indigestion. Possibly worms may be a part cause, but is more likely that you have been feeding too well and restricting exercise. Where that is done pigs tend to become plethoric and apoplexy results, causing rupture of a blood vessel in the brain and sudden death such as you describe. Reduce the rich feed and let the pigs live an outdoor life, so far as possible. If worms are seen in the manure give copperas as so often prescribed here. 2. Rat virus may be ordered by your druggist of a dealer in biological products. A. S. A.



Poor Man! Chained To a Cow!

How often you have heard that expression—showing the popular ideas as to "the bondage of the dairyman." There are two very good reasons for it: 1st, there are thousands of cows not paying for their board (250,000 in one State alone). 2nd, poor feeding, causing great waste. But things are improving, and that great dairyman, V. E. Fuller, and the "big-little" Farm Journal are having a great hand in it.

Mr. V. E. Fuller "Has Been Through the Mill"

and his wide experience as the confidential feeding expert of some of the greatest dairy herds in the country makes his word *authority*. Besides being a successful dairyman, he is an editor of note. He is one of the foremost experts of the world on the modern dairy cow. You should by all means

Read His Book—

"Feeding Cows for Profit"

In simple concise language it tells of the feeding methods and rations that have built up the profits of thousands of farmers. Mr. Fuller is universally known as a dairy feeder who never misses the mark. When cows fall off in milk, he's called upon. He mixes rations that build them up. The results of his many years of feeding experience are in this book. It's worth many times the original price of $5.00 (for the leather-bound volume). Our latest edition (in paper covers) contains all the original matter, and in addition, some special feeding formulas prepared by Mr. Fuller just for Farm Journal Folks. Here is your great opportunity of securing it:

FOR ONLY $1

Guarantee: The full amount of your subscription will be refunded if you notify us within three months after paying for it, to stop the paper. We do this because we know you'll like the Farm Journal, *It is "unlike any other farm paper."*

Famous Dairy Farms Whose Herds Receive Mr. Fuller's Rations

Elm Leigh Farm, Putney, Vt., Rich Neck Farm, Claiborn, Md., Briarbank Farm Birmingham, Mich., Middlesex Meadow Farm, South Lincoln, Mass.

These are only a few of the many noted herds whose great records are the results of Mr. Fuller's feeding rations, the very rations described in the book offered below. Hundreds of farmers have increased their profits enormously through using Mr. Fuller's methods. You can too. Accept our offer **today.** Build up profits.

Feeding Roots: More and Better Milk—Beef Mutton

ALL animals improve in condition and increase their product of flesh, milk, wool, etc., by being fed liberal rations of cut roots. No matter what else you feed, cut roots will improve the ration. They add a zest which means increased consumption of roughage and aid in digestion and assimilation. They put a top finish on market sheep and lambs. They put color and richness in milk and cream and resulting butter.

Banner Root Cutters

for both hand and power, prepare roots in the best possible way. Cut so fine as to prevent all choking of animals. It's done with the **"Non-Choke Curve Cut."** Made in seven sizes. Write for free illustrated booklet. Every animal condition will be improved by feeding a ration of cut roots.

The Cattle Grub.

ALL who handle cattle are familiar with the bunches which appear on the animal's back during late Winter and Spring. On squeezing these lumps an insect or grub is forced out. In some cases there will be 20 or more of these grubs on one cow or steer. They are very irritating and they injure the hide. Every year we are asked to tell how they get under the skin, the usual belief being that the eggs are laid on the cow's back. The following life history of the insect is taken from a circular sent by the Ohio Experiment Station:

"The fly (Hypoderma lineata) that causes this grub is known as the ox warble-fly, the heel fly, or the ox bot-fly. The eggs are deposited upon the hairs during the Spring and Summer, and the animal on licking them carries the eggs or larva into its mouth. The young maggot passes into the gullet. From the gullet it migrates to the back, where it causes a lump or swelling noticed in late Winter or early Spring. In the Spring or early Summer months, the grub emerges from the back of the animal through a small hole previously used for breathing purposes. Falling to the ground and burrowing in it the grub enters the pupal state, which covers a period of from three to six weeks. At the end of that period a two-winged fly emerges. Thus the complete life history covers almost a year."

How the Jumping Steer May Be Effectively Hobbled.

IT is really hard to tell just what will have the best effect in restraining the steer from jumping. A Michigan reader advises the poke with pole from three to four feet long. Another advises a long poke made of two poles, the upper cross-piece just in position to allow the poke to swing clear of the ground when the animal is standing. In the under cross piece at the lower end, a cross piece pointing dowr ward and out ward is inserted. This writer states that if a wide short strap is buckled around the ankle, and a short piece of rope attached to the horns from that strap, the animal will have to stay where put, and if this fails, sprinkle a little sugar around the field. For that is so high now nothing can get over it. Another advises a strap around the front legs of the steer at their smallest part, then fasten an inch rope to these straps so it will be taut when the steer's head is in grazing position. It may be fastened by snaps at the ends of the rope hooked into rings in the straps. Another advises haltering him and extending a good long rope to his hind leg, to which it should be fastened. He states that when the steer raises up to jump he will turn around and find himself established as a permanent fixture in the field. This writer also advises wiring the hoofs together. Little holes are bored in the hoofs and wire inserted so as to hold the hoof from spreading. It seems to take the spring out of them, for a split-footed animal will not jump very far nor hard if the hoof will not spread. Another writer advises nailing a pair of horse shoes on the front feet. All advise they have tried these remedies with more or less success, but the meat block is really sure.

Obstinate Cows and Kicking Heifers.

ABOUT 60 years ago, John S. Rarey created a great sensation with his method of taming vicious horses, applying it also to the breaking of other colts. He went to England and received a "command" to try it on a stallion in the Queen's stable that had killed his groom. Rarey had a coat sleeve made of iron, encased his arm and approached the head of the horse stall. The horse promptly seized it, and with the aid of grooms his head was secured, and the lesson continued. In two hours, Rarey rode him into the Queen's drawingroom, so the papers said, and a picture of its doing was published in the "Illustrated News." When Mr. Rarey returned to this country, I chanced to make his acquaintance, and he taught me his method. I used it successfully on several colts, and tamed an ugly steer in an hour's time so that I led him about town with a cotton string. The entire method is too long for a newspaper, but the first step of getting control is a short one.

Beginning with the kicker, provide a strap about 18 inches long, a hold-back strap, or a rope may be used, buckle up or tie up the near front leg. She cannot kick, and if gently milked and handled, talking to her or whistling, and two or three lessons will complete the cure. Or if you prefer to take the trouble to go through the entire lesson that follows for the other cow, once will be enough. The leading lesson follows, which is a paradox. In addition to strap above mentioned have one about four feet long, and a strap or rope around the body next to the forelegs. Fasten the long strap around the off foreleg and pass the other end under the body rope and body to a point where it can be easily held by the right hand. Have the animal in a well-littered yard or on a clean turf to avoid hurting the knees. Tie up the left front leg, hold the halter or rope about the horns with the left hand, and the other strap in the right hand, and when she lifts the down leg pull it up, and she will of course land on her knees. She will rear and pitch for a time, but will finally lie down in despair, and will not try to get up. Take off the ropes, and you can handle her as you like. At this stage Rarey used to lie down with his head between the horses hind legs. Handle the beast (horse or cow) in every way, till it does not shrink from touch, talking and petting at same time. Then go on the off side, lift up the head and get her back to an interest in life, by helping her up. You are her friend for life, and I think you can lead her anywhere. With a horse, treatment is the same up to now, but other lessons follow.

FRANK HYDE.

NEW ENGLAND MILK CONDITIONS.

AT the hearing on the cost of production of milk in Massachusetts held at the State House, Boston, October 15, much valuable information was given on the subject, yet it was not just to the point which the committee most wished to obtain. Very few farmers keep exact accounts of their expenses, that are itemized and specified as the committee wished. Yet all testimony given was very positive that few, if any, farmers could get or are getting a satisfactory income from this source alone. Another very important fact was brought out, and this was, that very little Massachusetts milk is bought by contractors for Boston consumption. All present were either selling their product direct to consumer or to independent dealers or peddlers not connected with or controlled by the big Boston dealers.

Practically only one witness admitted he believed he was getting his living from a herd of about nine cows, personally taken care of, and as the rule getting along without hired help. At first he stated his entire income was from his cows, whose production averaged about 10 quarts per day per cow, price received five cents per quart; average time of keeping cow productive eight years without renewing or replacing by another. Feed averaged eight quarts of grain per day, one pound of silage per feed and hay; thought $15 per year about right for depreciation of cow. After further questioning he admitted income from about 30 barrels of cranberries per year, and also sales of wood. He keeps about 100 hens which should help some. He stated his wife had the money from eggs, although he furnished the feed. A curious person in the audience asked if his wife had to buy the groceries from this money. He replied no; she used it as she pleased and he bought the groceries. This person then stated in many cases when the wife has the egg money she furnishes or helps to furnish these, which statement is true in many cases. This person was also questioned by the committee and stated he kept nine cows and received 45 cents per can for the milk, working into purebred stock as past as possible and expected from sales of these to make the business pay, but was very positive he could not make it pay or make a living by selling milk at present price even if more cows were kept.

One other witness stated he got his entire living from cows by selling milk; 48 cents per can is price received now. He now keeps 55 cows in milk, but started with few at first and had only $400 capital at the time; has sold milk and traded or sold cows all his life, but could not tell just what proportion of his income came from each, the sale of milk and the cow selling. His practice is not to keep a cow that gives less than 10 quarts per day, but get another in her place. His stand-by feed is just brewery grains, costing 12 cents per bushel, and he buys a load of over 100 bushels three times per week, hauls these six miles and takes one-half day to make the trip. He claims these grains are an ideal feed, and keep the cows in fine condition all the time; seldom or never has a sick cow; four quarts of meal per day is also fed, and cows are usually ready for the butcher when milked out. He stated if he could not get the brewery grains he would go out of the business.

All the others who testified had other incomes from other farm produce or sale of purebred stock or something of the kind from which part or most of their income was obtained, not from the sales of milk, which were quite large, but without profit to show for same.

Many good points were brought out, the most important of which was the general idea of depreciation of cows in the different herds. Some stated this as 10 per cent. of cost, but more thought 10 cents per day was more right. One stated cost of distribution of retail milk three cents per quart, cost of production 7½ cents per quart; depreciation of cows, $37 per year per cow. He was selling at retail at 10 cents per quart and thought he should get 11 cents in order to make profit. One who sold at retail at nine or 10 cents per quart in a nearby city thought about $2,000 per year profit was obtained from his herd of 40 cows.

One who keeps 30 cows and allows the 10 per cent. depreciation per cow, and sells at wholesale at 55 cents a can, considered his net profit $1,500 per year as price of services of good foreman. Those who figured on the 10 cents per day or $37 per year as depreciation cost only keep their cows a year or less as the rule; this makes the shrinkage very large, as you can see. Three women were present, and all had something to say. Two of these were city people, the third a farmer's wife, who assists her husband in care of cows and looking after the farm, as he is away several hours each day. The farmer's wife was much the smartest appearing of the three, or to put it another way, the best posted on the whole subject, and certainly made all her statements as clearly and intelligently as any man present, and yet was as much of a lady in dress, appearance and every way as the two city women; in fact put them in the shade. This pleased me very much, as some have the idea that farmers' wives are inferior and not up to date as city wives; they have much to learn along this line. I met another farmer's wife while at the Worcester Fair, who has an invalid husband, so that all the work and management falls on her, yet she seemed to be able to fill the situation successfully, and is doing much better than many men I know in conducting a large dairy farm, and getting a profit from same by making butter and raising veal calves and some stock. A. E. P.

COMING FARMERS' MEETINGS.

New England Fruit Show in connection with the Rhode Island Fruit Growers' Association, annual meeting in Providence, R. I., November 9, 10, 11 and 12; secretary, A. M. Parmelee, Norwood, R. I.

THE MIXED BREED.

1. Mrs. F. M. Earl, Connecticut, White Wyandotte.
2. Mrs. A. N. Conell, New York, White Wyandotte.
3. Mrs. R. W. Stevens, New York, White Wyandotte.
4. Mrs. W. S. Walters, Michigan, Barred Rock.
5. Mrs. G. L. Rothgeb, Virginia, Barred Rock.
6. Misses Osler & Wilcox, New York, Barred Rock.
7. Mrs. Robert H. Wood, New York, White Rock.
8. Mrs. Joseph di Fabrizio, New Jersey, Black Minorca.
9. Mrs. Emma H. Wood, New York, Buff Orpington.
10. Mrs. Edwin Walker, Massachusetts, Buff Orpington.

These birds will all be entered in the regular egg-laying contest at Storrs, Conn., which begins on November 1. It has required considerable management to have these entries properly made and classified. In order to make sure that the hens would not be mixed up, leg bands were sent to each of the parties named. These bands were all numbered and are to be put upon the left leg of the hen. For example, the "Leghorn" band will be numbered from 1 to 10 in the order here given. The hen belonging to Mrs. Rand will wear a band marked L No. 1, and so on through the list of hens. This number will also appear upon the outside of the crate when the hen is shipped. At the College the authorities will have a complete list of the names of the owners and also of the numbers on the hens, and when the pen is entered the hens will carry the contest numbers on another band to correspond with their numbers in this list. In that way there will be no chance of mixing them up or not having them identified.

Tags bearing the numbers were sent to each of the 30 women who have entered the contest. They are expected to send the birds early in the last week of October, so that they may reach the contest a few days in advance of the start, and thus give time for safe arrival and a few days of rest before the contest opens. In this way we hope to make a good clear start under the best of conditions. Very great interest is being taken in this favorite hen competition, and for many reasons, we believe it will prove one of the most popular features yet introduced into a contest of this sort. We believe these hens will represent the better class of farm flocks. Our understanding is that none of these owners can be called expert breeders. They have simply developed good flocks in their own way, but yet we shall not be at all surprised if the outcome shows that many of our farm women have actually developed a very superior strain of poultry. After the contest starts we shall give from week to week or month to month a regular report of the eggs laid, the food consumed, and egg profit of the hens and many other things which will interest poultry people generally. We also have in mind several features which will be introduced from time to time to liven up the contest.

A Pest of Fleas.

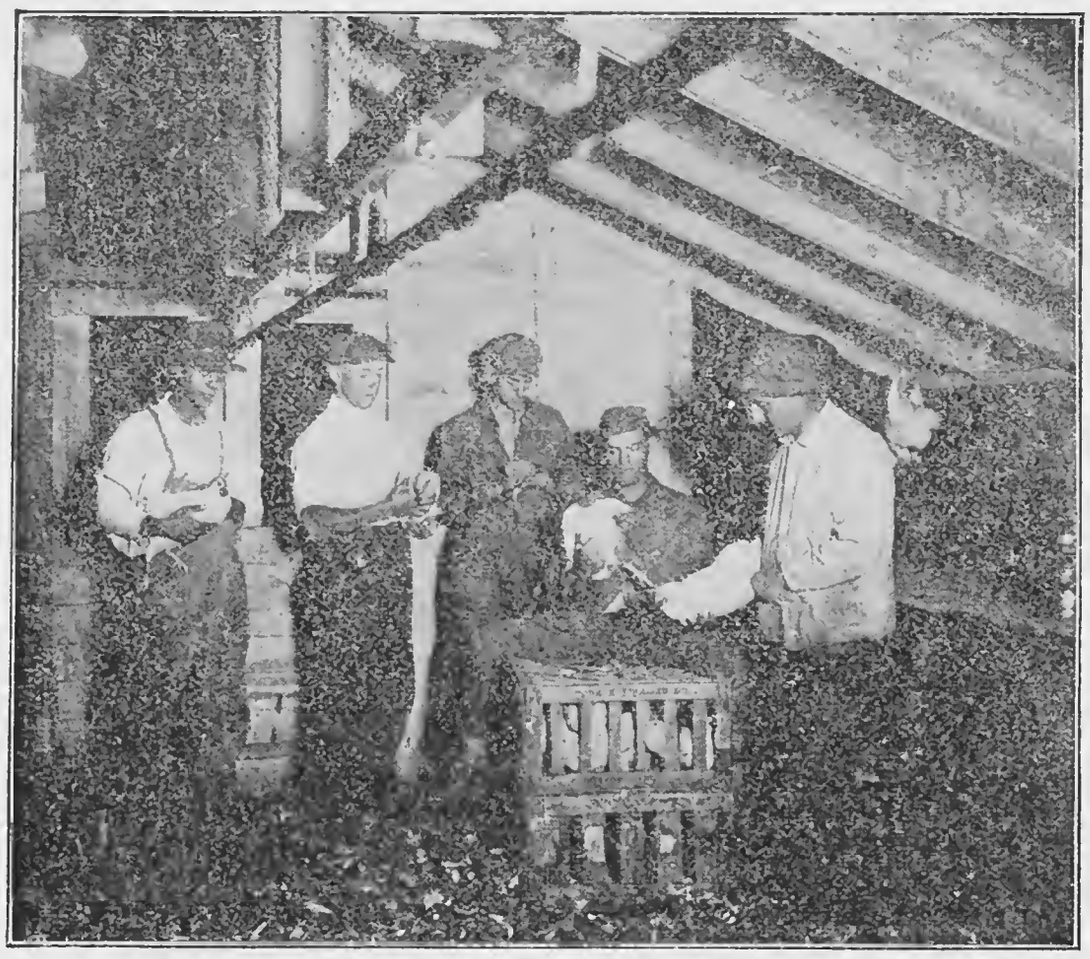
COULD you advise me how to get rid of fleas? It may be your paper does not go into families that have such, but fleas are like calamities; they are liable to come to anyone. We never had them before. They seem to be quite numerous just now. Will they go away when cold weather comes? We think they came from the cat. The cat is now under the sod. H. C.
Massachusetts.

The correspondent is undoubtedly right in thinking that the troublesome fleas came from the cat. Probably in nine cases out of ten where fleas appear and become annoying in a household in the East, at least, they originate from some pet dog or cat. The afflicted pet comes in contact with some neglected animal of its kind and catches the infection of fleas. If the cat or dog be left without attention the fleas will go on developing indefinitely.

The first thing to do then to get rid of fleas is to kill the dog or cat or free them absolutely from the pests. The correspondent followed the most sure and effective method of destroying the origin of flea infestation when the cat was put "under the sod." On the other hand, a cat or dog may be retained if proper care is followed in keeping them free of these pests. For example, a three per cent. solution of creolin made by putting four teaspoonfuls in a quart of water will kill fleas on a dog. The animal may be bathed in this solution if desired. For a cat a two per cent. solution should be used, as its skin is a little more sensitive than that of a dog. After the animal is freed from the pest the house still remains a problem, for invariably the insects have become more or less scattered throughout the rooms frequented by the cat or dog. This part of the fight often becomes strenuous and long drawn out.

If the infestation is severe the carpets should be removed from the floors and the latter washed with a strong solution of soap and water. If there are large cracks in the floor they should be treated with kerosene or gasoline and then filled with some crack filler. Cracks beneath the baseboards should be treated with gasoline or kerosene. The carpets should be hung in the sunlight, beaten thoroughly and in extreme cases sprayed with gasoline. One must not be deluded in believing that one treatment will always suffice. In many instances the work may have to be repeated more than once, as fleas are persistent and increase rapidly.

Dr. Henry Skinner of Philadelphia says that he has had very satisfactory success in destroying fleas by the use of naphthaline flakes. He took one room at a time and scattered five pounds of flake napthaline on the floor and then closed the room for 24 hours. Other rooms were treated in the same way, the flakes being simply transfered from room to room. He says "it proved to be a perfect remedy and very inexpensive.



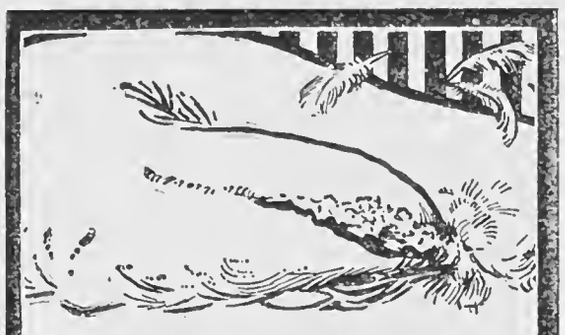
SELECTING THE BEST LAYER. (See page 1281.)

The Smoke Cure for Skunks.

ONE night last week the dog had a battle with a skunk, and succeeded in routing him, although with the usual consequences which follow when a skunk is stirred up. The dog, however, was very proud of his victory, and just as our people were sitting down to enjoy breakfast, the dog came running up from the barn wagging his tail, and saying, as only a dog can: "Look at me! I am a farm defender. I have conquered the enemy." There was a bunch of flowers on the table, the peaches were extra fine that morning, and it was a breakfast to enjoy, yet there was a general stampede when the good dog looked in at the kitchen door still wagging his tail. He was driven away with no gentle hand, and is probably still wondering why his humble efforts to please were not appreciated. Breakfast is the beginning of the day, and that day was spoiled for the majority of our people. The skunk is not a desirable character, although in his capacity of grub-destroyer and worm-eater he is a friend of humanity. We can get rid of him, but what to do with the influence he leaves behind him is frequently a problem. We have known reputable farmers who stood well at home, in the community, and in the church, who have been obliged to partake of their meals out in the woodshed for several days after an encounter with a skunk. Therefore he who can devise some method of relieving such a situation is a public benefactor. That is what we think on receiving the following letter. Mr. Huse admits that his statement may look "fishy," but he is prepared absolutely to vouch for its success in his case. We print it as an addition to the literature of the skunk, and there may be energetic and patriotic people among our readers who are willing to try this experiment and report its success or failure to us.

Most of us instinctively relinquish our right to the road whenever we meet a skunk, whether we have on our best clothes or only old duds. The apparent ruining of the clothes is one of the most serious inconveniences of being hit. It is not necessary to bury the clothes in order to remove the odor. Smoke will do the trick. I had been told of its efficacy, and a while ago when I received a full charge in the face and over the entire front of my clothing I hastened to try it. I made a smudge of wet hay and stood in the smoke about 20 minutes in the aggregate. The only other thing that I did was to wash my hands and face in clear water before trying the smoke. The odor was removed so completely that when I went in to supper about two hours later, with the same clothes on, no one had any idea that I had been near a skunk. This may not work so well in every case, but it is worth trying. I pass it along.

W. H. HUSE.



Lousy Poultry Can't Pay

Lice-infested poultry are a constant loss to the poultryman. Lice suck the rich lifeblood from poultry, stunt the growth of young chicks and rob you of your well earned dollars. These pests reduce the hens' laying ability. Buy an effective louse killer and use it liberally.

DR. HESS
INSTANT LOUSE KILLER

Kills Lice Instantly. Sprinkle it thoroughly on lousy hens, rub it well under the wings and neck, put it in the dust bath, in the nests, roosts and cracks. Instant Louse Killer also kills lice on farm stock, bugs on cucumber, squash and melon vines, cabbage worms, slugs on rose bushes. Comes in handy sifting-top cans.

1 lb. 25c; 3 lbs. 60c; except in Canada and far West.

If not at your dealer's, write—

The Henyard

THE EGG-LAYING CONTEST.

THE fifteenth week of the contest ended October 16. Only two more weeks to decide the question whether Tom Barron's White Wyandottes or Franeis Lineoln's White Leghorns are to win this contest. Lincoln's Leghorns are now 17 eggs ahead. Can the Wyandottes beat that in two weeks? During the week ending Oetober 9 they gained 13, this week they gained 8—21 in the two weeks. If they can make a like gain in the coming two weeks, they will win with a good margin. But Lincoln's Leghorns are holding up remarkably well, and the chanees are that the Yankee pen will beat.

Neale Bros.' White Wyandottes make the highest score this week, viz., 33, Mr. Barron's pen of same breed being seeond with 32. Three pens tie for third plaee with scores of 29 each, Fred H. Benton's White P. Rocks, A. B. Brundage's S. C. Reds and Glenview Poultry Farm's R. C. Reds. The week's seore follows:

GEO. A. COSGROVE.

A FARMER, steering a drove of troublesome porkers down a lane, met a group of superior young gentlemen, and one bright city youth endeavored to entertain his fellows with some fun at the farmer's expense. "I say, my man," said he, "do you know that a person grows in time to look like the animal he tends?" "Law, now, you don't say so!" returned the yeoman. "Well, then, I suppose you people have just left off keepin' monkeys!"—London Farm and Home.

Blackhead in Young Turkeys.

I STARTED last Spring with Silver-tipped Red Bourbon turkeys, three hens and one tom. I lost quite a number of small ones as it was a rainy season in this part of the State. I sueseeded in raising 11 turkeys whieh stayed with the old ones on the side hill baek of the house. They finally got to eoming to the house for a mixed seratch feed; after eating they would go below the house along a creek where choke cherries grew. I first noticed that they died without apparent eause. After watching them closely for a while I notieed that they seemed to have leg weakness, their wings would droop and they would not eat. Two or three days later they would die. Is it blaekhead? I have lost six fine young turkeys besides the two whieh are now afflieted.

New York. M. H. R.

The disease affecting your young turkeys is probably blaekhead, the symptoms that you mention being those displayed by poults suffering from this infection. The young turkeys droop their wings, lag behind the rest of the flock, walk and run as though very weak, have more or less diarrhœa, beeome emaeiated and are finally found dead in the fields. There is no known cure for this trouble and the infeeting organism is so widespread that prevention is very diffieult. Early and continuous feeding of soured skim-milk is of value in preventing the development of the infective organism and if possible to raise the turkeys on ground not previously oeeupied by other poultry the chanees of suceess are greater. M. B. D.

High Scoring and Egg Contests.

I NOTICE you have an inquiry asking why utility men with high reeords for eggs do not generally enter egg-laying contests. My reason is very simple. I do not know how to select, from untried pullets, birds of superior laying ability. I depend on the trap-nests to select my breeders, and thus far I have no sooner decided what manner of bird is a winner, than she is beaten by a bird I had passed by. I use only birds of known egg production in the breeding yards, never pullets, so I make no particular effort, exeept as an experiment, to choose breeders until the egg reeord is complete at the end of the pullet egg year. This trap-nesting of birds is no spectacular advertising feat with me, it is a business man's way of keeping a working knowledge of his manufaeturing plant. So many shining examples of "get-eggs-easy" chicken plants are stark and bare that they teach the absolute necessity of knowing what the stock is doing eaeh and every day in the year. Sundays ineluded. It is wholly a bread and butter proposition. GEO. R. SHOUP.

Washington.

Hen Ration.

IS the following a good ration for hens, and if not how could I change it? Wheat screenings in morning, corn and oats at night; all the dry mash they will eat all the time. How much grain per day should I feed 12 hens? A. R.

You are feeding your hens properly as far as I ean see. Of course, the term "dry mash" is indefinite, but I suppose you follow some approved formula. Hens should also have access to oyster shells and grit, and should be supplied with green feed if they do not have a grass-eovered range. As to the amount of grain to feed 12 hens, I really don't know. I intend to feed my hens what they will eat up at once, without leaving any, but I have no rule for determining this amount except to watch the hens. If you feed them too much whole grain they will not eat enough dry mash. Feed just about what they will eat up clean, and you will hit nearer the mark than if you measure it out in ounces or pints. C. L. M.

Oiling Chicks to Grow Feathers.

ON page 1073, A. C. G., Pennsylvania and A. P., Orange Co., N. Y., ask what to do for poorly feathered chieks. If they will rub them a few times with any good oil—ehieken or pig's foot—I think they will find that both feathers and ehieks will grow. At least that advice was given me, and has proved good. I. B.

Cobleskill, N. Y.

Ground Oyster Shells FOR HENS MICHAEL DIMLER, Ashland, Pa.

BURNETT'S STOCK ARE CHAMPION RECORD LAYERS They are winning at the best season shows. Special offers. Pekin Ducks, $1 each. 300 White Turkeys from the world's greatest stock, $15 per trio; Minoreas, Cockerels, $5 each. Handsome birds. Money returned if not pleased. Send address for our new Circular. COLDENHAM POULTRY YARDS, W. L. BURNETT, Prop., Montgomery, Orange Co., New York

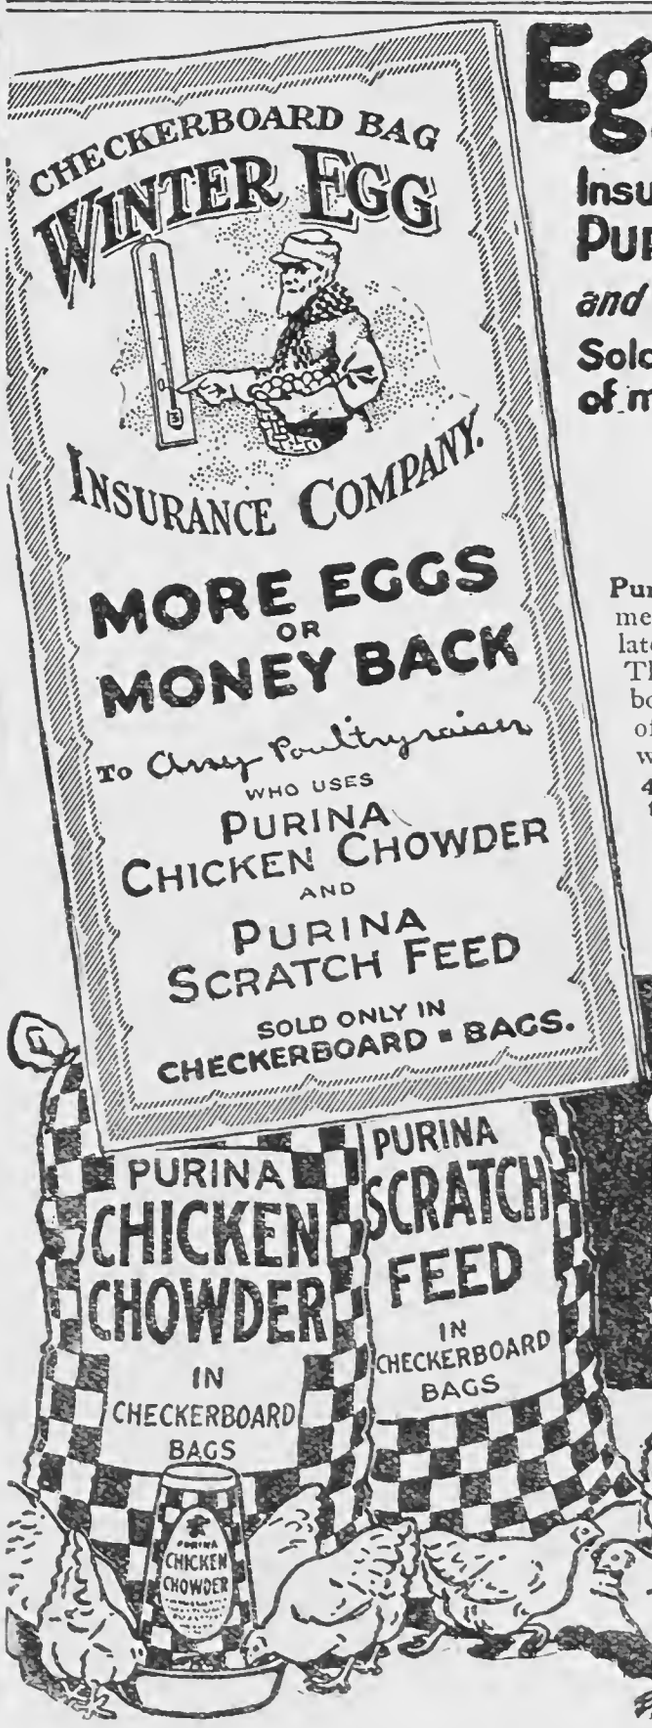
Insure Winter Eggs by using PURINA CHICKEN CHOWDER and PURINA SCRATCH FEED

Sold under iron-bound guarantee of more eggs or money back.



Purina Chicken Chowder contains cornmeal, bran, middlings, linseed meal, granulated meat, alfalfa meal, and charcoal. The leading dealers sell it in Checkerboard Bags only, on an absolute guarantee of more eggs or money back, when used with **Purina Scratch Feed.**

48 Page Poultry Book Free (new edition) containing breeding and feeding charts, plans of houses, cures of diseases, space for daily egg records, etc. Also information about Boys' and Girls' Poultry Club and prizes. Write today.

Ralston Purina Company,
827 So. Eighth St. St. Louis, Mo.

Trial Offer: If your dealer cannot supply you with Purina Chicken Chowder, send us $2.50 and we will ship you a 100-lb. bag by freight, collect.

To Retail Merchants: If your jobber cannot supply you with Purina Chicken Chowder, send us your order for not less than 200 lbs. and we will see that it is delivered to you at regular dealers' prices—packed only in 100-lb. checkerboard bags and in 100-lb. checkerboard bales containing twelve 8⅓-lb. packages.

Publisher's Desk

THIS edition of THE R. N.-Y. is the first one on our new press. If it is not up to the usual standard of printing, we ask the indulgence of our readers. We will try to make it even better than before. That is the ultimate object of a new press; but no one can tell just what the complicated and delicate machine will do on the first trial. The shafts must settle into their bearings and be adjusted before we can hope to get the best results. As soon as this is accomplished, we expect to give you a bigger and better paper than ever before. The old press printed 40 pages at one time. The new one prints 64 pages; and gives two colors on the cover when wanted. It is also a much finer adjusted machine, with extra ink distribution, so that we can use a higher finished paper and get better effects on illustrations. Incidentally it costs a little more than $25,000 to install. But our friends need not be afraid to embarrass us now with new subscriptions. This new press will turn out papers up to 12,000 copies per hour. With our new building and our new press we are prepared for any service. We send out 20 tons of paper now every week on THE R. N.-Y. This is 160,000 copies. We want to make it 200,000; and we will then feel content as far as circulation goes. Keep us sending out 200,000 papers weekly and back us up in the future as in the past, and you and we, working together, concentrating our influence through the paper, can get anything to which farm interests are justly entitled.

The trial of James J. Farmer, Colonel William J. Hartley, Samuel F. Warfield and others and the Anglo-American Authors' Association, of 225 Fifth avenue, on indictments charging the use of the mails in the operation of a scheme to defraud, is in progress this week. According to the postal authorities, the defendants reaped profits amounting to nearly $10,000,000 in three or four years from the sale of ornate editions of classic and modern authors. Men and women of wealth yearning for de luxe editions with colored illustrations, have been led to pay enormous prices for volumes which they could have purchased from reliable booksellers for one-third or sometimes one-tenth of the price charged by the Anglo-American Authors' Association.—Local Paper.

The key to this swindle came out in the trial. The victims admitted that they had been led to believe that in a short time they would be able to resell the books at an enormous profit. Cupidity is the one string that the promoter has to play on, and he always makes the most of it. Of course, because a man or a woman has an itching for quick riches is no reason why he or she should be robbed; but it is the weak point in the armor of the average victim, and the promotor knowing human nature, always finds it. The romantic stories in the daily papers about big prices for rare books helped the rogues to play on the gullibility of their victims. The average person cannot appreciate the difference between a useful book and one that is rare.

I have been receiving a number of letters from an insurance brokerage company that wishes me to send them $20 for a bid on 10,000 bushels of wheat or corn. They tell me that if wheat goes up one cent on a bushel I would make $100, two cents, $200, etc. Do you think it would be safe for me to send any money for a bid or not? L. U. F.

New York.

If you understand the proposition of the grain broker we do not think you would be very much interested in him. What he wants you to do is to make a bet. In other words, you bet $20 that wheat will advance one cent a bushel. He bets $20 that it will not. The only difference is that you put up the $20 and he does not. If the price of wheat does not go up, but goes down, you lose your money. If it should go up he would charge you for brokerage, and as a rule manipulate it in some way either to induce you to put in more money for another bet, or failing in this, find some other scheme to keep your money. Betting on a horse race is a little surer thing than this method of betting on the rise and fall of grain markets, but understanding the situation we do not think you will want to bet, and at all events our advice is don't.

I believe it would be of interest to you to know that I visited Dr. George A. Shepard, of Hartsdale, N. Y., and he happened to mention THE R. N.-Y. It immediately aroused my curiosity, and I asked him what kind of a paper it was. He said he certainly could not get along without it, and that it was one of the best edited and most interesting publications that he subscribed to, and was one of the last on which he would fail to renew his subscription. A. B. U.

New York.

Of course, reports like this are interesting and pleasant. When we started out to make a paper for the active business farmer we had no thought that such a paper would also interest professional men and gentlemen farmers; but we now see what we might have anticipated but did not, that the latter class, being more in need of definite, practical and reliable information about farm business than the experienced farmer, are counted among the most enthusiastic friends of the paper. These people realize that a service to the humblest man on the farm is also a service to them. There are yet city men who swallow the romance of a farm bait, hook and sinker, just as a get-rich-quick victim takes in the gold-brick prospect; but the man who really wants to know turns to tested sources of information.

I am delighted with what you have done for me. The D. B. Cornell Company sent me a check today for $15. I do thank you sincerely, because I never expected to get it. I shall subscribe to your paper as long as I have a dollar to do so. My neighbor has not received her $15. W. J.

Connecticut.

This subscriber had a receipt from D. B. Cornell Company, agent in his own handwriting, reading as follows:

The farm of————————is taken for twelve months from date and if the farm is not sold by above date the fee for listing and advertising is then returnable to the said owner. J. J. LOOKER.

The fee was $15, and this seems to have been paid as a listing fee, the owner taking the receipt. At first the company refused to return the $15 on demand after the year expired, claiming that the owner had not withdrawn the property, and that when withdrawn by the owner the fee would be $80, and $65 would be due them rather than $15 due the owner. The withdrawal fee was not mentioned in the receipt, and we insisted that the money be returned as promised. The Cornell Company seemed to put it up to the agent, Looker, but finally sent the check as requested. We still have a similar complaint from another party in the same neighborhood for an equal amount on the same kind of a receipt. We believe the claim is collectible and we are going to insist upon having it. J. J. D.

Leghorn Characteristics.

WHAT breed of S. C. White Leghorns is it that has yellow feet and legs, and are they better than those with white feet and legs? G. A. C.

Ohio.

All purebred S. C. White Leghorns should have yellow feet and legs, this being one of the characteristic marks of the breed. This yellow color will fade out as the hens become old but should be marked in young stock. M. B. D.

Lame Chickens.

WILL you tell me what is the matter with my chickens and what to do for them? I first noticed that they walk with a peculiar hitch in their gait and go only a little way before they drop down as though their legs would carry them no farther. They gradually grow worse until in a few days they cannot walk at all. Their appetite is good, they will eat anything I give them and I can see nothing wrong with the droppings. They get very poor, but they seem to feel well. There are no lice on them. They have been having a grain ration of three parts cracked corn and two parts wheat and until the last two or three have had a dry mash of equal parts cornmeal, wheat bran and beef scrap before them all the time, also sour milk. They have free range, but for some weeks they have been rather crowded at night, as my coops were not large enough to accommodate them as they grew larger. R. W.

Pennsylvania.

The overcrowding of these growing chicks may have led to sweating and subsequent chilling with rheumatism as a result. I can only suggest that you confine those that show evidence of leg weakness by themselves in warm, dry, quarters and feed them less meat and more green stuff. Giving the others more room and seeing to it that they are not exposed to dampness and drafts while on their perches should prevent further extension of the trouble, if, as is probable, rheumatism is the cause of it. M. B. D.

Hens Eat Feathers.

I HAVE abont 125 chickens just on a town lot. I feed them corn, wheat, oats, bran, ground green bone, shells and grit, and still they pick the feathers off each other. It seems they do it mostly at night. Their backs and breasts are bare. They are such good layers I do not like to part with them. Will you tell me if there is anything I can do to stop them eating the feathers? T. S.

Pennsylvania.

The feather eating vice is frequently hard to control; it is most apt to be found in fowls that have too little exercise and are fed on too exclusively a corn diet. The irritation from the presence of lice and mites may also cause birds to begin the habit. The fowls should be given all the liberty and exercise possible, a variety in food, including animal food of some kind, and should not be without grit and charcoal. The worst offenders may be removed from the flock and the bare places on the rest well greased with carbolized vaseline. Search should be made for lice and mites and if these are found they should be disposed of by the use of dust baths for the fowls and by painting the perches and nests with some one of the liquid vermin destroyers; of these, a mixture of one-fourth part crude carbolic acid and three-fourths parts kerosene is efficient. M. B. D.

Favus in Fowls.

WHAT is the matter with my White Leghorn pullets? Last Spring I purchased four settings of eggs from a person who had very nice Leghorns, supposed to be purebred. When the pullets got a few weeks old they got scabs on their necks just below the head and later on it seemed to scatter down towards the body, the neck would swell up and feathers come out. They seemed to have a good appetite, but couldn't swallow very well. I killed some. The person from whom I got the eggs is having the same trouble, and a neighbor who got two eggs hatched their pullet and rooster and their pullet has it too. F. A. L.

New Jersey.

Your description of the disease affecting your pullets suggests that it may be a contagious trouble known as favus. This disease is characterized by the formation of scabs about the head and neck, which scabs may later extend to other feathered portions of the body and cause loss of the feathers. The bare skin is then found to be covered by crusts of a dirty white color and showing cup shaped depressions in the center. At first the general health of the fowl is not affected but as the disease extends symptoms of exhaustion appear and death may ensue. The remedy is to isolate the affected birds from the healthy members of the flock and to disinfect their quarters with whitewash and carbolic acid. The individual birds should be treated by gently removing the crusts with some smooth, blunt, instrument and anointing the surface with a mixture of calomel, one part, vaseline eight parts, this to be repeated daily, or by painting the parts with tincture of iodine. With isolation of affected fowls and persistent attention, the disease should be eradicated from the flock. M. B. D.

Dry Mash; Forcing Molt.

WHAT, in your opinion, is a good dry mash for White Leghorns? Would you advise forcing hens to molt, shutting off their grain two-thirds for about two weeks, and then feed them heavily, thus forcing molt? H. B.

Lisbon, Me.

A good dry mash, much used by the writer, is made up of equal parts of wheat bran, middlings, cornmeal and gluten feed, to which about one-eighth part of meat meal is added. The mash will be improved by the addition of a pint of fine salt to each two hundred pounds. The authorities at the Cornell Experiment Station, after a series of experiments, concluded that forced molting, or attempts at it, were not advisable and that the natural process should not be interfered with. M. B. D.

Ailing Hens.

MY hens sicken and die (White Leghorns and laying). Their crops would fill up, not hard; their heads turn purple. They are very thirsty and appear to be very stiff. Would linger several days or week. I feed wheat, oats, bran and middlings mash. W. S. R.

I cannot say positively what the trouble with these fowls is, but suspect some inflammation of the digestive tract. They may have obtained some putrid food or eaten some poisonous matter to which they obtained access. Marked thirst is an indication of such condition of the stomach and intestines, but of course a positive diagnosis cannot be made from one or two symptoms alone. A cathartic dose of castor oil; one to two teaspoonfuls; to each hen and confinement in a comfortable place where it can have soft food and plenty of clean water until death or recovery would be rational treatment in the absence of more definite knowledge as to the cause of the trouble. M. B. D.

Are you going to build?

Are You Planning Repairs?

If so, our twenty-five years' experience with building materials and methods is at your disposal for the asking. For every sort of work there is a right way—and many wrong ways. Tell us the sort of work you plan, whether house, barn, garage or factory. Our Building Counsel Committee's advice will probably save you money, whether you use our products or not.

Neponset Roofings for All Farm Buildings

All we ask in return is permission to submit samples of Neponset Roofings, Spark-proof Shingles, Wall Board, Building Papers and Floor Covering, in the hope that they may prove to be exactly what you need.

Remember—a "slowly made" roofing is the only kind that is slow to wear out.

Every foot of Neponset Roofing is "slowly made" on the "how-good-can-we-make-it" principle. It's the only way to insure a roof's being 100% weather- and waterproof.

"Hurry-up" roofing costs you almost as much, and what do you get? Half a roof, a constant nuisance and source of expense.

What you want is roofing "slowly made" to give a service of years.

We believe better dollar-for-dollar roofings are not made than

NEPONSET ROOFINGS

And the line of Neponset Roofings is complete. Neponset Paroid has become standard for farm, factory and railroad buildings. Neponset Shingles are spark-proof, attractive, non-splitting and non-curling.

Neponset Proslate is the colored ready roofing for bungalows, etc. There are other roofings for other conditions. Also Neponset Wall Board—three finishes—waterproof—takes the place of lath, plaster and wall paper. On all or any of these we will send

Building Advice, Samples and Booklets FREE

If you don't know one of our thousand dealers, just write us.

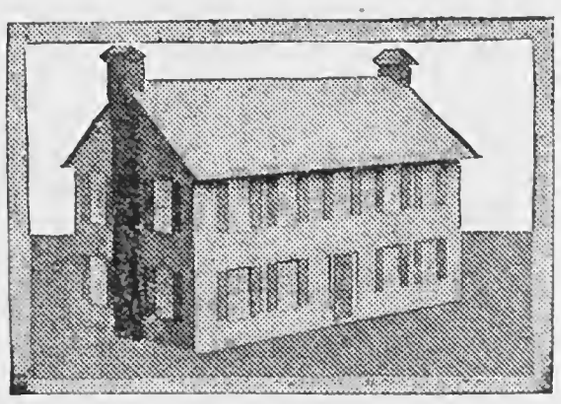
BIRD & SON (Est. 1795)

707 Neponset Street East Walpole, Mass.

New York Washington Chicago San Francisco

Canadian Office and Plant: Hamilton, Ont.

For $3 we will send prepaid this pretty Neponset Doll House. Equal to houses toy stores sell for as high as $10. If you don't think so, return it at our expense and get your money back. This price is possible because it shows you so perfectly several of our products. (Size 19 inches high, 2 feet 6 inches long. Shipped flat.)



HANDY BINDER

Products, Prices and Trade.

Wholesale Prices at New York.

Week Ending Oct. 23, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with October is as follows. This is per 100 pounds in the 26-cent zone. This is what is known as the "maximum" for milk testing 3.8 to 4.2 per cent. fat, and is 20 cents per 100 pounds above the "flat" rate.

	1914.
October	$2.00
November	2.10
December	2.10
January	2.05
February	1.95
March	1.90

Wholesale prices paid by New York dealers are running $1.91 and $1.81 for B and C. Hotels and restaurants using two to three cans per day are paying five to six cents per quart, single quart prices from bakeries and grocery stores, six to seven cents; delivered milk, nine to 10 cents."

BUTTER.

Prices on the higher grades are unchanged. Medium and low qualities are in considerable surplus, and dealers ready to cut prices where necessary to clear out their stocks.

Creamery, extra, above 92 score, lb	32½	@	33
Extra, 92 score	31½	@	32
Good to Choice	26	@	28
Lower Grades	22	@	24

Process	22	@	26

Elgin, Ill., butter market 30 cents.
Philadelphia, western creamery, 32 cents.
Chicago creamery, 25@30

CHEESE.

The one feature of the week has been an increase in export demand for both Wisconsin and State make. Prices for this trade have run 13 to 14 cents on whole milk.

Whole Milk, fresh, specials	14¾	@	15
Average fancy	14¼	@	14½

Daisies, Wisconsin	14	@	14½
Skims, specials	12	@	13
Good to choice	10½	@	11½
Poor to fair	7	@	10

EGGS.

Fancy nearby eggs are very scarce, as has been the case for several weeks. An occasional lot has brought 52 cents, but to approach this they must be large and pure white, as well as fresh. The bulk of trade in fresh gathered is in the range of 30 to 35 cents. Very little being done in storage eggs, as prices, except on top grades, are not good enough to warrant sales.

White, choice to fancy, large	50	@	52

CANADIAN DAIRY LAW.

A law in effect September 1 has stringent regulations covering adulteration, misbranding and short weights of dairy products. One section apparently prohibits the possession or sale of oleomargarine and renovated butter, as it states that:

No person shall manufacture, import into Canada, or offer, sell or have in his possession for sale, any oleomargarine, margarine, butterine, or other substitute for butter, manufactured wholly or in part from any fat other than that of milk or cream.

Mix with or incorporate with butter, by any process of heating, soaking, rechurning, reworking, or otherwise, any cream, milk, skim-milk, buttermilk or water to cause such butter when so treated to contain over 16 per cent. of water.

Melt, clarify, refine, rechurn, or otherwise treat butter to produce what is generally known as "process" or "renovated" butter, nor add any milk or cream to butter.

No person shall import into Canada, or offer, sell or have in his possession for sale any butter containing over 16 per cent. of water or any process or renovated butter, or butter to which milk or cream has been added.

*

From August 15, when the Panama Canal was opened, to October 4, 100 vessels passed through. To October 1 the total tolls paid amounted to $369,706.

*

Our exports of foods, cotton and oils for the nine months ending September 30 were valued at $616,043,896. Important items were: Corn, $5,724,419; wheat, $105,522,416; flour, $37,628,175; meats, $40,707,360; cotton, $242,208,637; oils, $107,115,034.

*

In 10 days, ending Oct. 20, there the following exports of foodstuffs from New York to Europe: Wheat, 1,539,415 bushels; flour, 1,340,000 pounds; corn, 171,915 bushels; oats, 577,782 bushels; rye, 176,725 bushels.

*

At the Saturday "bargain day," recently held in the New York open markets, the following prices were noted: Potatoes, 80 cents bushel; cabbage, head, five cents; apples, bushel, 90 cents; sausage, pound, 12½ cents; lamb by the quarter, 9 to 12 cents; beefsteak, 18 cents; fresh pork, 14 cents; roasting chickens, 16 cents.

*

The wool market during the past week has been in stronger position than for some time previous. The demand for Winter clothing from the war zones has stirred up manufacturing and the embargo on certain wools from Great Britain has shut out part of our normal supply from the London auctions. It is expected that a serie sof auctions will be held in Australia and New Zealand, in which no doubt American buyers will be interested. Prices on unwashed delaine at Boston have run at 24 to 25 cents, and 28 to 29 for half blood. Western territory wools have brought 19 to 23 cents.

Subscribers' Exchange

ALFALFA HAY—F. P. ERKENBECK, Fayetteville, N. Y.

SECOND CUTTING ALFALFA for sale. E. V. BEACH, Oriskany Falls, N. Y.

PURE HONEY—Direct to Consumer; circular free. HARRIS T. KILLE & BRO., Swedesboro, N. J.

NEW HONEY—Basswood or clover in sixty-pound cans; write for prices. C. A. HATCH, Richland Center, Wis.

APPLES, APPLES, APPLES—For choice sprayed Winter Apples. Please order to-day. C. J. YODER, Grantsville, Md.

FOR SALE—Valuable fruit and poultry farm of 9 acres. Fine market. MOORE & SON, Nazareth, Pa.

FOR SALE—Fifty-three-acre farm, with improvements, near Bridgeton. A. J. ALLEN, Salem, N. J.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

WANTED—Farmer work large dairy farm on shares, near Ithaca; splendid chance for right man. H., care R. N.-Y.

WANTED—Position on farm by young man; six years' experience; what have you got? state wages. L. A., care R. N.-Y.

WANTED—Position as fruit pruner, fifteen years' experience; best reference. Maryland preferred. L. SIMMONS, Wernersville, Pa.

POSTION WANTED as farm foreman or herdsman, experienced; best references; wife would board help. AMERICAN, care Rural New-Yorker.

FARM WANTED—Farmer owning complete up-to-date farming implements, wants farm of any size to work on shares. Address MRS. R. JAMGOCHIAN, Merchantville, N. J.

POULTRYMAN graduated from a scientific course, and worked on the largest plants in the United States, will take charge or go as an assistant. G. J., care Rural New-Yorker.

PARTNER WANTED—Florida live-stock proposition, with capital, by university trained agriculturist; 500 acres rich clay soil, near Tallahassee. L. HEIMBURGER, Tallahassee, Fla.

WANTED—About Nov. 15 by two young men, positions on stock, or dairy farm. life experience; no liquor or tobacco; good teamsters and milkers. Address RELIABLE, care Rural New-Yorker.

EXPERIENCED POULTRYWOMAN desires correspondence with woman interested in organizing poultry business in country town near good market; unquestionable references exchanged. Address K., Rural New-Yorker.

EXPERIENCED DAIRYMAN wants permanent position; willing to work at moderate salary if the position is permanent and the surroundings congenial; age 40, and would prefer place where work is not too heavy. M. R., care Rural New-Yorker.

WANTED—Position as herdsman or caretaker by sober, single man of 30; life experience in feeding and caring for stock; best of references; will go anywhere; state full particulars and wages in first letter. ARTHUR RIPLEY, Skaneateles, N. Y.

HERDSMAN WANTED—Married, about 35, with some college training, experienced in purebred Holsteins and dairy practice, and at present employed; must understand feeding balanced rations for milk and A. R. O. and be a good milker. MOHEGAN FARM, Peekskill, N. Y.

WANTED—Competent, experienced farmer, 300-acre Niagara fruit and stock farm, fine location, surroundings and equipments all up to date, good opportunity for man who can show results from past records; state in full references, age and salary wanted. CHESTNUT RIDGE FARM, Lockport, N. Y.

WANTED—By a first-class manager, at present employed managing a large private estate, a position of similar capacity, private or commercial, thoroughly versed in up-to-date farming and thoroughbred stock raising; capable of managing any large proposition; highest references; satisfactory reasons for leaving. Address "SHELDONCROFT," Silver Lake, Pa.

WANTED—Position as caretaker and general utility man on gentleman's private place, by an American, married, two small boys; have had six years' scientific, 10 years' practical training, thoroughly understanding care and feeding of all farm animals, farming, gardening, horticulture, dairying, carpentry, farm machinery, engines, etc.; not a user of liquor or tobacco; best reference. W. B. F., care Rural New-Yorker.

TENANT WANTED for improved 130-acre farm near Seneca Lake, Seneca County, New York; 16 acres grapes, 8 acres apples and peaches, rest tillable soil producing Alfalfa, corn, wheat and hay. Good water and accomodations for stock. School, church and R. R. near; progressive neighbors, ample barns, house and outbuildings. A No. 1 opportunity for the right man. Good reference required. HERMAN VAN VLEET, Olmstedville, N. Y.

FOR SALE—Fully equipped poultry plant in San Joaquin Valley, Calif.; particulars free. O. C., care R. N.-Y.

FOR SALE—257-acre farm, good buildings, would include stock and tools. For particulars address CLARENCE RICE, Camden, N. Y.

FOR SALE—Small place, Sullivan Co., N. Y., over two acres; good buildings; adapted for chickens and truck. JOSEPH ROGERS, Farmingdale, New Jersey.

FARM—177 acres, $4,900; terms; level timber, buildings, fruit, water, fences, productive, warm climate, with photos, description. PHOTOGRAPHER, R. 3 N., Decatur, Tenn.

POULTRY FARM FOR SALE—Paying good profits, fifty acres, beautiful home, ¼ mile from depot, 6 miles large city; 1,000 layers; broods 3,500; $10,000; $6,000 cash. Address POULTRY, Rural New-Yorker.

WANTED to rent, with privilege of buying, country place, not over 125 miles from New York City, suitable for Summer boarders; modest size, moderate price; accessible by vehicle to main railroad. Address with particulars, JOHN R. METZGER, 379 E. 162d St., N. Y. City.

UNUSUAL FARM BARGAIN—160 acres dark loam soil slightly sloping east, free from stone, never-failing water, 14-room house, with hot and cold water and fine bathroom, large, new barn, buildings all newly painted; farm lays on main road one mile from small village. Price $4,000; one-quarter down, balance at 5 per cent. Write quick if interested. C. L. STONE, Oxford, Chenango Co., N. Y.

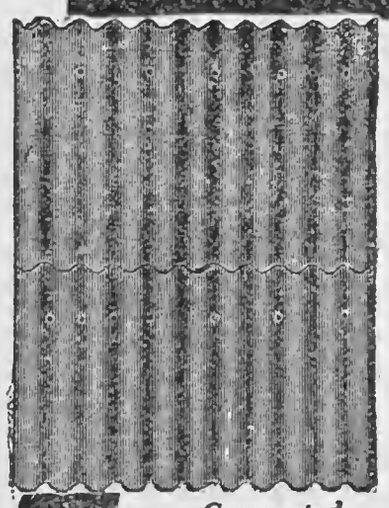
Lightning-proof, Fire-proof, Rust-proof, Rot-proof, Galvanized Steel Roofing—Lasts as Long as the Building Stands

That's the kind of roof you want to invest your money in, isn't it?

All roofing you have ever bought heretofore had three cost prices—the first cost per square laid on the roof—the cost per year for up-keep—the cost of property damage by leaks. Here then, is *real* roofing economy.

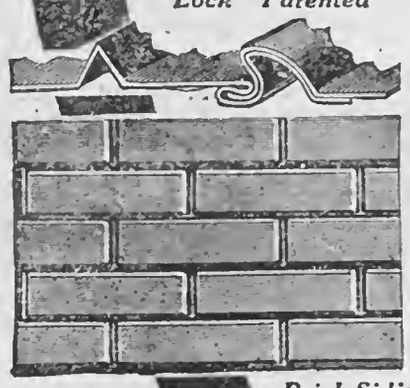
Once you have purchased and laid Edwards Tightcote Galvanized Steel Roofing your roofing expense for that building is at an end for all time.

Its cost per square is the lowest ever made. It has *no* up-keep cost. Its property protection is absolute. Its years of service, as long as the building stands. Always beautiful in appearance. *Guaranteed Fire-proof, and Lightning-Proof. Reducing the cost of your fire insurance.*



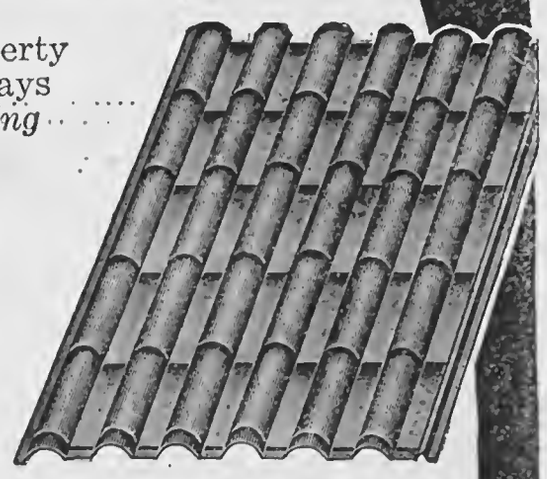
Corrugated

Edwards "Grip Lock" Patented



Brick Siding

Reo Steel Shingles



Spanish Metal Tile

Eave Trough

EDWARDS Exclusive Tightcote Process
Makes Rust-Proof Roofing

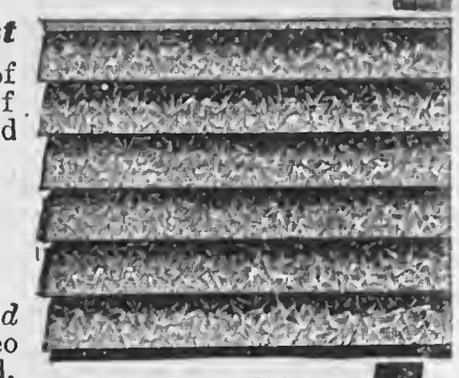
The Edwards process of galvanizing makes the zinc spelter practically one piece with the steel. No ordinary galvanizing can compare with it. Each and every *Edwards Metal Shingle, Metal Spanish Tile,* each sheet of *Edwards Reo Steel Shingles, Grip Lock Roofing, Pressed Standing Seam or Roll Roofing* is dipped in a *bath of molten zinc, one at a time after the metal has been stamped and resquared.* This insures a uniformity. *The edges are galvanized* as heavily as the sides. Not the space of a pin-point on the steel is exposed to the rain, snow, frost, acids or anything that eats or destroys a steel roof.

How to Test Galvanizing

Take a piece of any other galvanized steel, bend it back and forth several times, hammering it down each time. You will then be able to flake off great scales of the galvanizing with the finger nail. Apply this test to a piece of *Edwards Tightcote Galvanized Steel Roofing*—you'll find no flaking—not a space on the metal the size of a pin-point exposed to rust.

EDWARDS Patent Interlocking Device
Prevents Warping, Buckling or Breaking—Protects Nail Holes—They Can't Leak or Rust

This device not only takes care of expansion and contraction so that an EDWARDS Steel Roof never warps, buckles or breaks, but it is so designed that nails are driven through the *under* layer of metal only—nail holes are protected from exposure—cannot rust. No special tools or experience needed to lay it—anyone can do the work—lay over old shingles if you wish.



Weather Board Siding

Reo Steel Shingles

cost less—outwears three ordinary roofs and are your joy and pride forever. A most beautiful roof.

No matter what kind of a building you have in mind there is a style of EDWARDS *Tightcote Galvanized Roofing* exactly suited to your needs. We manufacture and sell all of the many patterns of Edwards Reo Steel Shingles, V-Crimped, Corrugated, Standing Seam Roofing, Siding, Ceiling, etc., painted or galvanized, and all other kinds of the best grade of sheet metal building material.

Freight Paid Factory Prices

This is positively the greatest roofing proposition ever made. You can't afford to neglect investigation. All we ask is a chance to prove to you that we do indeed offer the lowest prices ever made on the world's best steel roofing. Won't you write today for our freight prepaid price and be convinced. We are the largest manufacturers of Iron and Steel Roofing in the world. We sell direct to you from the largest, most modern sheet metal plant in existence. *We save you all in-between middlemen's profits.* Because of our immense purchasing power of raw materials—our wonderful manufacturing facilities and enormous output, *our prices are rock bottom. We prepay freight and give you a binding guarantee against lightning losses.*

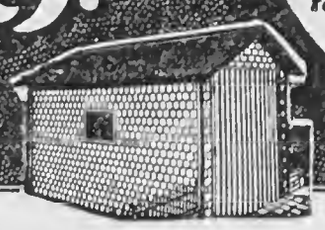
Edwards Fireproof Steel Garage $49.50



If you want a garage that won't rot, rust or burn—a building that's attractive, yet practically indestructible, here it is. An "Edwards" Ready-Made, Fire-Proof Steel Garage. Affords perfect protection with least possible investment. Quickly set up any place. Direct-from-factory-prices—$49.50 and up. Postal brings 64-page handsomely illustrated catalog.

Reo Steel Shingles: Every man owes it to himself to investigate the wonderful value in these most durable shingles before going into roofing expense. The most attractive roofing made—Cheap, Durable, Fire-Proof, Lightning-Proof, Rust-Proof.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LXXIII. No. 4280. NEW YORK, NOVEMBER 7, 1914. WEEKLY $1.00 PER YEAR.

STEER FEEDING IN NEW JERSEY.

A Business Likely to Come Back.

WOULD it be profitable and safe to buy 1000-pound steers at this time, feeding them for five months or until Spring, and then disposing of them? I mean to finish them off for the market. What age steer is it most profitable to buy? Will the European War tend to increase market price by Spring? I have as a ration for this Winter's feeding, corn silage, corn and cob meal, and can purchase either wheat bran or cottonseed meal. Would this be as large and safe a means of profit as that of putting on dairy cows? I know it would mean considerably less work.

New Jersey. J. E. W.

There are so many factors involved in the inquiry that it would be quite necessary to know more of the local conditions in order to answer the questions with the most intelligence. In the first place, the cost of transportation from sections where feeders could be purchased in carload lots adds materially to the cost of the animals delivered to the farm. The loss of one or two animals, either during the period of transportation or in getting them accustomed to local feeding or climatic conditions, would consume considerable of the profits. In the second place, conditions for marketing in the East are disappointing. In many sections of the State, butchers or buyers will pay no more for prime steers in a finished condition than they will for old dairy cows in good flesh. A surprisingly small percentage of our butchers buy animals on the hoof, preferring rather to buy so many hind quarters, so many loins or so many fore quarters on the hook. They are not butchers in the strict sense of the term, but rather meat cutters. Their argument, no doubt, is a convincing one; namely, that they do not have to dispose of the refuse products, nor to keep the necessary help and equipment necessary for slaughtering. Their running expenses are much less.

On the other hand, if the inquirer can obtain representatives of any of the beef breeds locally or delivered at his station at reasonable cost, and provided he can market his finished animals at a price consistent with the quality of the meat produced, there is no reason why beef animals should not convert his corn silage, cornmeal and purchased cottonseed meal into meat at a profit. He ought to obtain market prices for his farm-grown products, be paid day wages for the labor involved, and have the manure as a dividend. Animals known as short two-year-olds, weighing from 800 to 1,000 pounds, would make the best mediums for feeding.

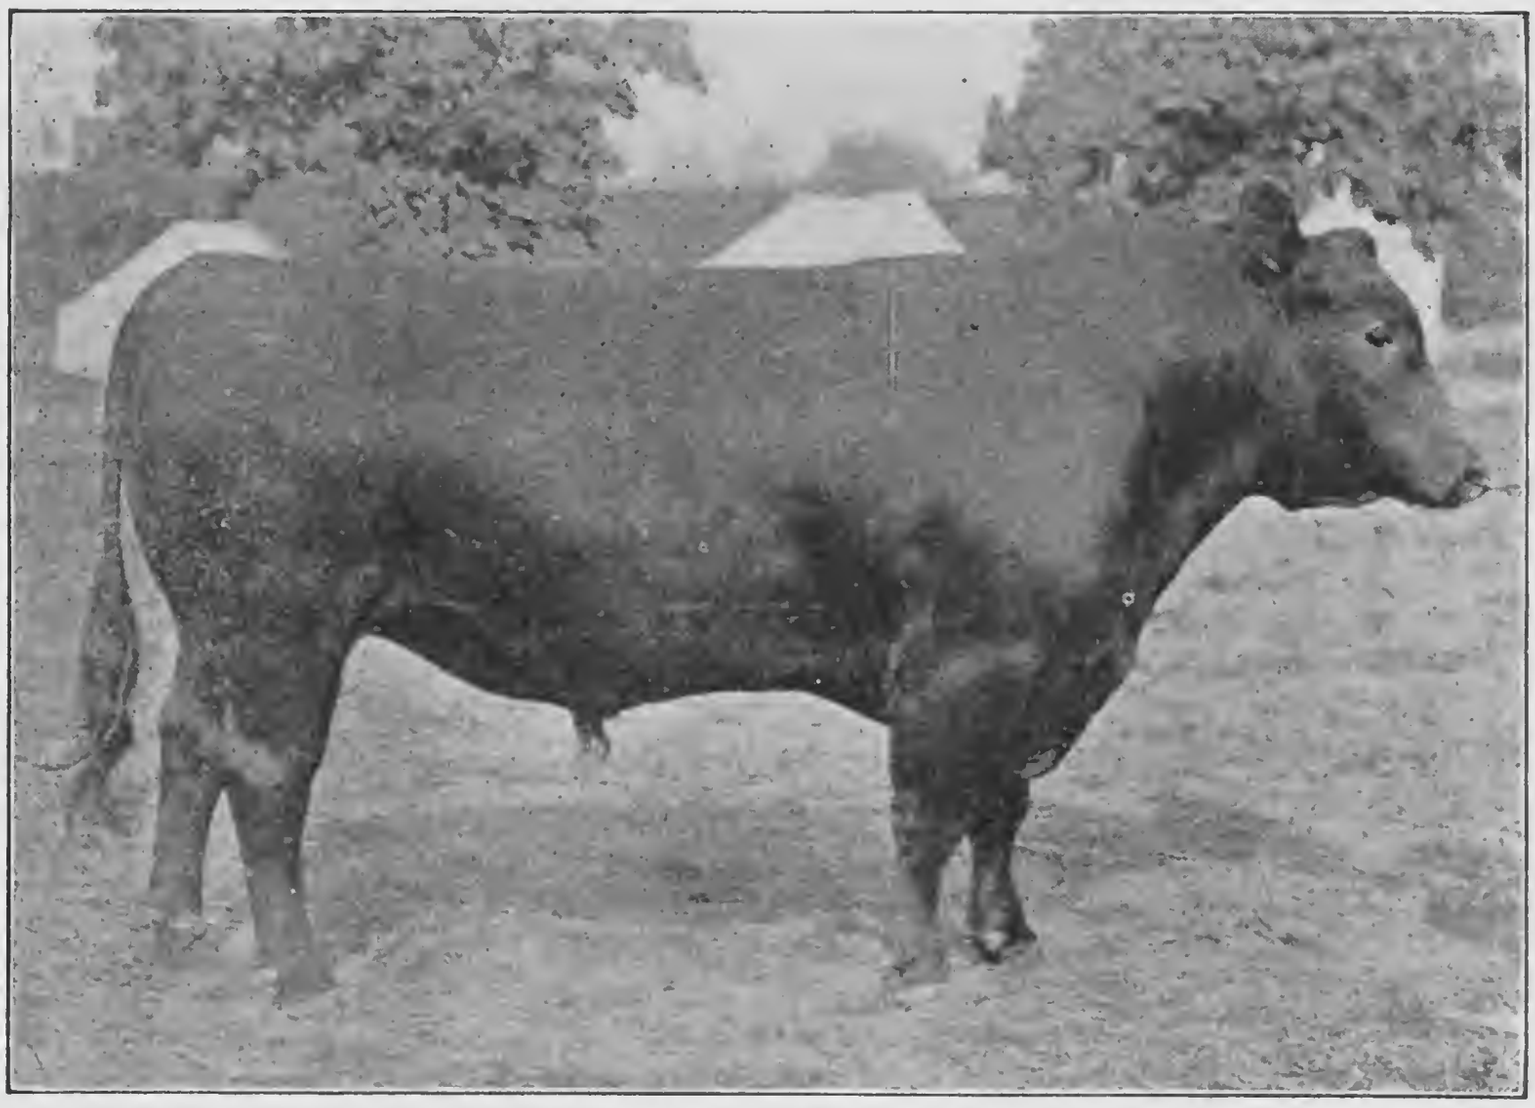
If he lives in a dairy section, and the farmers in that community buy a great many dairy cows, as is the prevailing custom, it would seem reasonable to believe that a more profitable line of procedure would result in case dairy heifers were purchased and fed through the Winter months, and sold as they were about to freshen in the Spring; for instance, it would be possible to buy a carload of bred heifers at a cost varying from $50 to $65 each; they could be wintered on silage, corn and cob meal, supplemented with some cottonseed meal, and would, no doubt, bring in the neighborhood of $90 to $100 each in the Spring. Dairymen pay these prices for heifers or cows brought in from New York State and Pennsylvania, and I know of no reason why such a scheme would not pay. The heifers should be tuberculin-tested and housed in such a way as would promote health and vitality. They would utilize the farm products economically and the voidings would be just as valuable.

In case J. E. W. has an abundance of pasture land, he might buy heifer calves a year old, run them through the Winter, as suggested, put them on grass in the Spring, and either sell them in the Fall, if they were old enough and large enough to breed, else winter them still another season and sell them as dairy heifers in the Spring, when they are about to calve with their first calves at three years of age.

This fact is significant: the problem facing the Eastern farmer is that of producing more of the products that he uses on his own farm. A few years ago, practically every farmer in New Jersey fattened a few feeders, even though they were only dairy cows or steers. Now he not only buys his milch cows, but a large proportion of the feed that he gives them. The home-grown heifer calf out of a sire and dam whose record for production and reproduction is above the average is a much safer medium to feed home-grown products to than is the animal that is picked up from the drover and fed purchased food stuffs that contain so-called elements that the calves cannot find. F. C. MINKLER.

New Jersey Station.

R. N.-Y.—Prof. Minkler here touches on a problem we have often referred to—a market for Eastern beef.



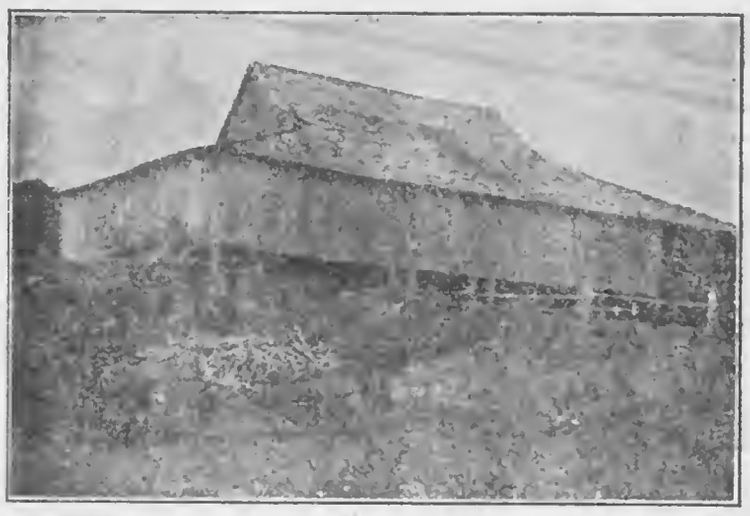
THE BEEF BREEDS.—A FIRST PRIZE ANGUS BULL. FIG. 569.

ABOUT THE DEVON CATTLE.

IT is no more than right that the most domesticated cattle should have a picture in THE R. N.-Y., and a statement as to their worth. The Devon type is shown in the statues of Egypt, illustrated in National Geographic Magazine, and presumably the Devon cattle have been under the care of the milkmaids for 3,000 years or more. I find that the bulls are as tame and gentle as the cows, and they are very intelligent, so that they are used largely for oxen. I visited Dr. Buell's farm and saw about 70 superb Devons; all his surplus males were made oxen and trained and sold. The Devon herd books and the New York Experiment Station give the tests for the milk, and it is the richest in casein, and is above the average in fat. I find that my Devons (registered) keep up their milk flow long after calving, and do not as my Jerseys did, give a bountiful flow at first and then go down to almost nothing. I haven't as yet kept a daily measurement of the amounts of milk given by my cows, but Dr. Morris, (President of the Devon Cattle Club) has, and he finds that the Devons are not at all at a disadvantage in comparison with other breeds of cattle. I am breeding the dairy type, so my animals are smaller than the usual beef-bred Devons, but, as a matter of taste I prefer a small cow; in proportion to their size with the others they give more milk, the mother of the mother of my herd was a 20-quart cow, so the owner, B. J. Wightman, wrote me; at any rate without the trouble of daily weighing or measuring the milk I am quite satisfied with their yield.

The superb appearance of these Devons as lawn or pasture ornaments cannot be excelled by any other breed; rich red in color, with large, branching white horns, large, beautiful eyes, and a placid disposition that adds to their beauty. They just suit a landscape. The milk is the finest for drinking, it having none of that oily flavor so objectionable in the Jersey milk. In fact, my daughter, then a young child of nine, didn't like the flavor of the Jersey milk on account of its oiliness, and I read of the Devon milk being the best for children and invalids because of the better proportions of the food nutrients, consequently the Devons are here and are prime favorites. The mother of the herd, now 11 years old, is said by many to be the finest cow they have seen and the finest in the county. The bulls I have had are all gentle, as gentle as the females; I haven't put a ring in the nose, only the same rope that ties the cows to tie them, and that is a comfort, for some of my neighbors with Jersey, Holstein and Dexter bulls find them very cross, and some are positively dangerous. Two neighbors were killed by their own bulls.

The Devons' home here in Southern Maryland is the beautiful pasture nearly all the year, for short intervals they go in this barn, Fig. 572, which is typical of this county. It is a useful barn, the plan of which might be followed to advantage. The driveway is plenty wide enough, for farm implements to be on the sides, such as plows, cultivators, harness, seeds, fertilizers, etc. It is very handy to drive a



A MARYLAND CATTLE BARN. Fig. 570.

load of hay right under cover at times. Even on Long Island I found the Devons reluctant to go into stalls at night—they seem always to prefer the open. The vice-president of the Maryland Horticultural Society wrote me that cattle in St. Mary's County did better if allowed to be out all the year, and one of my tenants did so Winter before last, and his cattle wintered well. At any rate this is a far different climate from Winnipeg and Alberta, and the wheat here is fine, above the average in yield.

Maryland. ELBERT WAKEMAN.

A FIG PROPOSITION—THE LATEST.

HALF A DOZEN people from Canada to Delaware have sent us the following notice, which appeared in the daily papers. We omit the address:

"IS HE CRAZY?

The owner of a large plantation in Mississippi, where the fine figs grow, is giving away a few five-acre fruit tracts. The only condition is that figs be planted. The owner wants enough figs raised to supply a co-operative canning factory. You can secure five acres and an interest in the canning factory by writing the..... They will plant and care for your trees for $6 per month. Your profit should be $1,000 per year. Some think this man is crazy for giving away such valuable land, but *there may be method in his madness.*"

This seems to be a very slick concealed advertisement—one of the meanest forms of fishing for suckers. We submitted the proposition to a very intelligent correspondent on the Gulf coast. Here is his report:

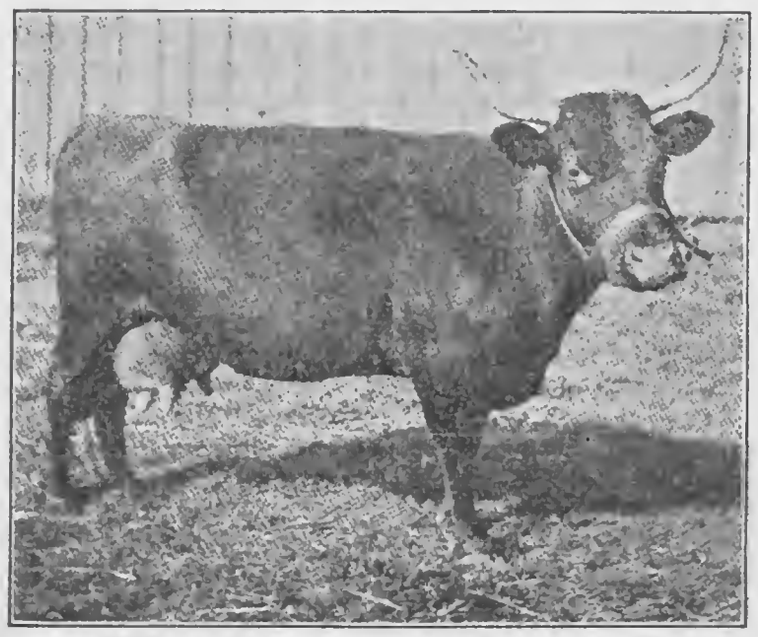
River plantations along the Alabama and Tombigbee rivers, in Alabama, that is, alluvial deposit soil which was rated as a bale to the acre for cotton when slavery solved the labor question, can be bought at from $5 per acre up, due to the trouble of getting labor to cultivate the land. In view of the value of the land as a whole, I would not judge that it would be much over $10 to $15 per acre, and it is a good proposition for a seller to give away five acres worth $75 and get $72 per year for several years for looking after it. I do not think the man is mad, but wants to unload his plantation.

The fig orchard proposition is a very dangerous enterprise for a Northern man to venture on. As a rule, with rare exceptions, the orchard treatment of figs is a failure in this country; Cudahy, the meat packer, set out an orchard of 13,000 trees in Baldwin County, within 30 miles of Mobile, got an expert from Chicago to operate it, and this season (1914) estimated he should get a good crop for young trees. I have learned on authority that I accept as correct, that every tree in the tract dropped its entire crop, and the orchard produced no revenue at all. No doubt his manager was competent to manage a peach, apple or ordinary orchard, and assumed that the fig was amenable to the same treatment, which it is not.

While California has fig orchards and produces dried figs, they are from what I have read and heard, mostly of the Smyrna type, the male and female trees, and fertilized by the fig wasp, the insect often being brought from points south of the orchard where the climate permits them to winter. This is an entirely different fruit from our figs, which belong to the "mule" type, and are incapable of being reproduced from seed, but are propagated by cuttings and suckers and it is probable that the California methods would not work on this different tree. The California fig is primarily large, rather coarse and well adapted to drying; our fruit is small, juicy, delicate, and is pre-eminently a table and preserving fig and is practically useless for drying. The fig is a very delicate fruit, and a rain on it when about ripe swells and sours it on the trees, so a large portion of the crop is lost this way; I figure on an average that half of the fruit on my place is destined to be lost this way; the season just gone, I believe it amounted to two-thirds of the crop. The fig ripens in our season of rains, so you can safely figure the rain damage. The year of the great freeze, I forget the date, that wiped out the Florida orange orchards, every fig tree in this section was cut to the ground, but grew again from the roots.

There is no doubt that there is good money to be made from a fig orchard, as the supply is short of the demand, but to successfully orchard the fig is something which will require more study, and is a proposition for the future. It is strictly to-day a back-yard and fence-corner tree, flourishing in such locations of apparent neglect, and such conditions, in view of present information, must be duplicated to orchard it successfully. The co-operative cannery looks like a promoter to me. The fig canneries here are those putting up oysters and shrimps, and are open for the fig season with nothing else to do, when it comes. An ordinary cannery would have to use them as a side line, or crowd out some other fruit, and could operate just as well without figs as not.

Taking the proposition in another light, if a man had a good and productive plantation which he could cultivate, he would not get rid of it in five-acre driblets at a reasonable price, certainly not give it away. Further, if he had a good plantation but had not available labor to work it, how could he get the labor to cultivate the small tracts? We have a good climate, the range in temperature compared to other sections is small, it suits me right down to the ground, but I very seriously doubt that the average Northern man would like it after he had grown up under other conditions; further, he does not understand the negro, and would never learn to handle that class of labor, practically the only kind avail-



A TYPICAL DEVON COW. Fig. 571.

able, and I would not advise him either to buy or accept as a gift (without a string to it) any land down here, until he had lived here several years and saw if it suited him. He probably would not care to live on his place, and to run it by absent treatment would be a losing proposition, and he couldn't sell it, for I do not think there is a market for fig orchards; I have never seen one offered, and doubt a buyer could be found if it was.

CONCRETE FLOOR FOR BARN.

I WOULD like advice about putting cement bottom in a basement barn 30x60 feet. A. A.
Addison, N. Y.

If your floor is to be a continuous basement floor, without special arrangements for stalls, etc., its construction will be a very simple matter. If the soil is of open, well-drained character, the dirt floor may be leveled and tamped, and the concrete laid directly upon it, but if it is inclined to be wet it will be safer to lay a sub-base of field and cobble stones eight or 10 inches in depth. Build the concrete floor in sections, working from the walls toward the centre to permit of using the open centre for working purposes. Set 2x4 scantlings upon edge against the base of the wall, running the long way, and parallel with them and eight or 10 feet distant, another line of scantlings, fastening these to the ground by means of short stakes. Fill the space between these two lines of scantlings with your concrete mixture, leveling it with a straight-edged board resting at the ends upon the scantlings. After the concrete has become somewhat stiff, finish the surface with a rough float or wire brush. Set another line of scantlings at a convenient distance within this section, and continue the process until the floor is completed, removing the used scantlings as soon as the concrete has become sufficiently set and filling the spaces left with the concrete mixture. The standard mixture for such a floor would be one part of cement, two and a half parts of sand and five parts of crushed stone or gravel; if you have a natural bank mixture of gravel and sand suitable for this purpose, however, one part of cement to six or seven of sand and gravel should make a good floor; local masons should be able to advise you as to the proportions needed. Unless a specially smooth, hard, surface is wanted, it is not necessary to use a finishing coat of sand and cement. Small cobble stones may well be used in the concrete, but they should not be allowed to come within less than one or two inches of the surface. If desired to waterproof the floor, a layer of concrete may be laid and tarred paper spread over it; this to be mopped over with hot tar and the concrete filling then completed. With some one who understands the mixing of concrete to supervise the work, such a floor may easily be laid by ordinary labor. M. B. D.

FARM ECONOMY—A CROP ROTATION.

CAN you help me solve the following question in crop rotations? A man, having a farm of a given size wishes to raise chickens and hogs as his chief products with orcharding, potatoes and hay as side lines. His grain crops therefore must comprise, to be used exclusively in feeding his live stock, corn (chiefly), oats, wheat, buckwheat. He sets apart a certain portion of the farm for orchard, buildings, permanent pasture and garden (potatoes), the remainder for his grains. He naturally wishes to have the rotation shortest possible, thereby cutting his land up into the least number of plots and having the fields the largest possible. My idea would be:

First year, corn; last cultivation plant cover crop. Second year, corn; after harvested sow Winter wheat. Third year, one-half of field to buckwheat (for chickens) and one-half to Soy beans or some crop which would make good roughage for hogs, and which can be planted late. These two crops are put in after wheat is off. Cover crop same Fall, if possible. Fourth year, oats and clover, sown together. Harvest oats, then pasture clover, from say middle of August on, with hogs. Fifth and sixth years, hay, light cutting first year. With regular cutting second year, would this hay crop pay? However, this rotation requires a long period, and consequent inconveniences. It is possible that you may consider some one of these crops unprofitable, or that one could buy necessary amount rather than raise it. If so, of course, omit it. K. E.
New York.

The proposed plan of crop rotation is quite a feasible one. It would seem to me, however, that the following suggestions might add value:

First year, previous to last cultivation, sow cover crop of wheat and vetch or rye and vetch. Second year, corn, to be followed by Winter wheat. Third year, instead of putting in buckwheat and Soy beans as suggested, I would prefer to seed a mixture of rape and Soy beans, utilizing six pounds of rape and a bushel of Soy beans per acre. These could be seeded after the wheat had been harvested, and would make a most excellent forage for swine. A cover crop consisting of rye and vetch or wheat and vetch should be seeded in the Fall. Fourth year, oats and Canada field peas, drilled early in the Spring. They may be harvested either as green forage or cured as hay, or even matured as hay and thrashed. This field should be seeded to grass during August or September without a nurse crop. We have had the best results in establishing meadows by taking advantage of the Fall seeding of grass seed. A crop of hay could be harvested during the next two years, and it is recommended that a mixture of grass seed be utilized, namely, Timothy, Alsike, Red clover with a little Alfalfa, rather than straight clover or Timothy.

If it is intended to produce crops primarily for poultry and swine, the rotation could be shortened, utilizing corn, to be followed with a cover crop seeded in the Fall. This area could be pastured in

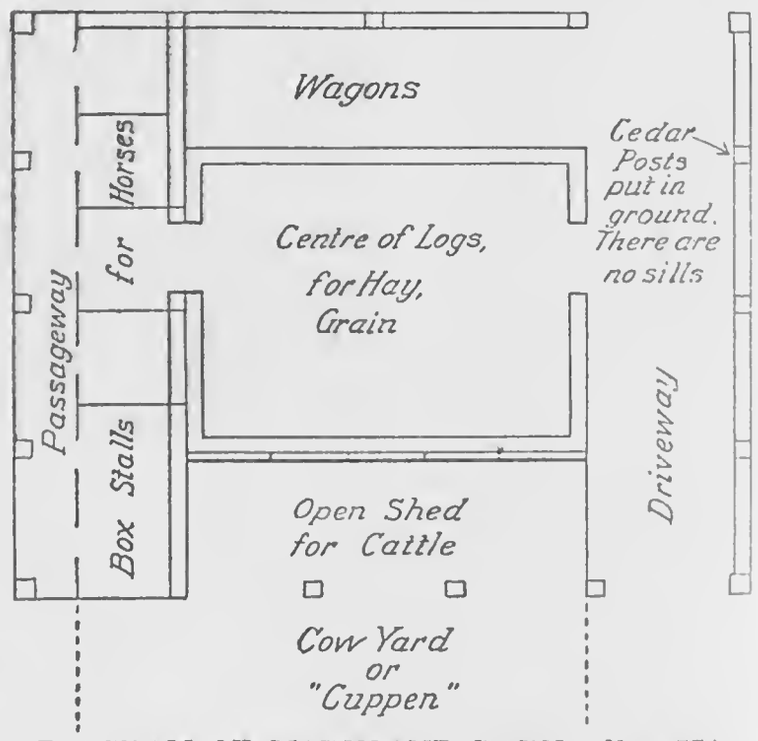


DIAGRAM OF MARYLAND BARN. Fig. 572.

the early Spring, and the rye and wheat harvested as scratch feed for the chickens and the area plowed and seeded with rape or Soy beans; this crop to be utilized as forage for swine. After frost appears in the Fall the ground could again be plowed and seeded to a cover crop, and this rye and vetch plowed under during the early Spring, and the area planted with corn. This is a two-year rotation that is very practical and useful? The swine and poultry products in this case would be the only cash products, unless other areas of the farm were devoted to hay and other grains. F. C. MINKLER.
New York.

BRAZILIAN METHOD OF MANURING TREES.

Experience in Orange Groves.

WITH regard to the use of manure in orchards, we made a very interesting and suggestive observation in Brazil last Winter in this connection. We found in the orange groves in the vicinity of Rio de Janeiro, and more particularly at Bahia, that the orange growers practice the application of manure to their orchards regularly and in considerable quantity. In fact we were told by many orange growers, and found no contrary opinion, that manure in those citrus orchards was absolutely necessary for the maintenance of healthy and productive trees. They use the term manure to include both the manure from dairies or other sources, the composting of various organic substances with this manure, packing-house refuse, and, in one or two cases, other highly nitrogenous substances, such as the sugar cane after the juice had been pressed out of it. We were repeatedly informed by the leading and most successful citrus growers, without exception, that this practice was absolutely necessary in order to grow healthy orange trees.

The method of using this manure by these orange growers did not make so much impression on us at the time as it has since we have had an opportunity to study and digest our notes and observations made on this expedition, since returning to the United States. In the first place, as a rule the manure is collected in cemented pits; care is taken to preserve the liquid as well as the solid manure, mixing both before distributing the manure in the groves. Usually cisterns are provided for collecting the liquid manure, from which it is taken up by buckets attached to ropes. The manure is buried in the soil in the orange groves.

On level land, a hole about three feet across and 15 inches deep is dug with a heavy hoe, called "enchada," in the center of the square made by four trees. The trees are planted on the average about 20 feet apart each way in squares. On hillsides this hole is dug directly above each individual tree, perhaps five feet above the tree. The earth is somewhat banked up on the lower side of the holes. After the manure is placed in these holes the loose earth is thrown back on the manure, usually resulting in the loose earth being raised above the surrounding soil several inches. In a short time, however, the manure and loose earth settle so that these holes filled with manure and earth have the same level as the rest of the orchard.

There is no doubt in my mind but what there is a philosophy about this method of using manure in citrus and perhaps other orchards which is worthy of careful study in this country. The method used by the Brazilians is, no doubt, an inherited method, handed down from generation to generation, perhaps from Portugal, and even before this from India, from which source the Portuguese secured their citrus trees. From India the Portuguese carried their citrus to Portugal and later to Brazil. A. D. SHAMEL.

U. S. Dept. of Agriculture.

R. N.-Y.—In Florida we were told by expert orange growers, whose groves were on light soil, that manures and organic fertilizers were not satisfactory. The reason given was that the organic manures kept up a long continued supply of nitrogen—often causing a rank growth too late in the Fall. Therefore these growers preferred chemicals containing soluble plant food. The soil and conditions in Brazil may be different from those in Florida. It has long been known that if we plant manure or even a bone in the soil some distance from a tree or vine the roots will turn and make for this buried plant food.

GOOD WORDS FOR SWEET CLOVER.

ON page 1209 W. F. Massey, of Maryland, writes rather disparagingly of Sweet clover; calling it a rank weed, and remarking that there is no need for it in that State. Maryland must indeed be a very fertile State if there is no land in it that could be benefited by a crop of Sweet clover, or where a crop of this legume would not be the most profitable one that could be grown. For several years I have been quite an extensive grower of Sweet clover, therefore feel competent to testify to its qualities, good and bad. It is equal to Alfalfa as a forage crop; far excels any of the clovers as a seed crop, and is only a shade under Alfalfa in nutritious properties; contains more nutriment than Crimson clover, and Timothy is not in the same class.

After cutting a hay crop, which in every respect will compare favorably with the first cutting of Alfalfa, you can harvest a seed crop ranging from four to 15 bushels per acre, which is now selling in central Ohio from $10 to $12 per bushel of 60 pounds, with the supply not equal to the demand. In most States, and possibly in Maryland, there are gravel and clay hills which will grow no crops, and wash greatly. A sparse covering of grass may possibly succeed in its struggle for existence, but 10 acres would scarcely afford pasture for one healthy cow. Sow this same 10 acres to Sweet clover, 20 pounds per acre, early in the Spring, and it will afford good pasture for the first year for all of the stock found on the average 100 to 150-acre farm, and the second year it can either be pastured until the middle of June or a hay crop be obtained. About the middle of September a seed crop can be harvested, then the field can again be pastured until early Winter. This seed crop will easily pay for the feed consumed by the stock the remainder of the year.

Sweet clover is a biennial plant, with seed crop best the second year. It is an easy crop to raise, as the ground requires no special attention. All that is necessary is scratching the surface with a disk or an ordinary iron-tooth harrow, and broadcasting 20 pounds of seed to the acre. My first experience was rather unique. I carefully prepared a 35-acre field—good soil, and drilled in the seed with oats as a nurse crop. Another field of 15 acres, gravel and clay hills, was scratched over with a disk. Seed was sown broadcast. In an old gravel pit of about two acres, the seed was sown broadcast, without any preparation whatever. In the 35-acre field with good seed bed, the effort was a complete failure, but in the 15-acre field and the gravel pit I had excellent results. I afterwards found out, by experience, to be successful, you must have a very compact seed bed, with a pulverized surface of not over one-half inch in depth. The seed in the 35-acre field was drilled in too deep, and the soil underneath was too soft. All of my stock prefers Sweet clover pasture and hay to any other. C. H. K.

Springfield, Ohio.

AFTER A NUTTING EXPEDITION IN CONNECTICUT. FIG. 573.

A NOTE ABOUT NUTS.

IN answering the letter of M. H. M., of Virginia, on page 1255, you speak of "White walnuts or hickories." In Bulletin 17, Division of Forestry, U. S. Department of Agriculture, "White walnut" as a name in use for Hicoria ovata, or shagbark (hickory) is given only from New Jersey; whereas "White walnut" as a name in use for Juglans cinerea, butternut, is given from 16 States, including Virginia. So undoubtedly your correspondent had this nut in mind when he asked about the market value of the "White walnut."

As you say, the great drawback to the Black walnut and the butternut is the thick shell and the difficulty of getting out the meat. There must be somewhere trees of these varieties that bear nuts that have thinner shells and meats that are easier to get out. It is now comparatively easy to propagate any nuts by budding and grafting. If any person knows of a superior Black walnut or butternut he should make it known to the U. S. Department of Agriculture for expert opinion and for propagation if found worthy.

About the hickory (shagbark, H. ovata) you say "The percentage of these nuts of good size, thin shell and easily removed meats is small." This is true, but there are nuts with these good qualities, and there will be more of them some day when people realize that they can top-work their hickories of any variety with selected varieties and get nuts that fetch the highest market prices. But many of the trees that bear these extra good nuts are dying off year by year, without anyone making an effort to have them perpetuated by grafting.

W. C. DEMING,
Secretary Northern Nut Growers' Association.

HOW TO STORE SEED POTATOES.

STORE them in the cellar exactly the same as apples in bins, only be careful to see that the temperature never goes lower than 32 degrees. In the Spring it is most difficult to keep the seed in perfect condition. Early sprouting does to some extent lower the vitality, but this of itself is not necessarily most damaging, because if the seed is stored in thin layers, well aired, we always find it strong after planting, judging by the stand of plants. But it is when the seed is stored in a large body that we have trouble; then the seed will heat, and the worst of it is there is no way of determining the extent of the damage, for it looks exactly like the seed spread out in shallow layers.

We have found a better way than to depend on cellar storage in late Spring. As soon as the seed shows a tendency to sprout, we remove from cellar storage, treat with formaldehyde solution and immediately spread in a thin layer on the grass. If the seed is intended for late planting we put it under the shade of trees and let it lie there for weeks or until we are ready to plant. The seed will at once begin to put out short, stubbed, leathery, green sprouts. The longer it is spread out the tougher these sprouts seem to be, working perfectly without injury in any of the modern planters. It is by this means that we get the perfect stand, for when the seed is cut the future plant to be is right before you. There is no chance for heating as in cellar storage at this season of the year, and we are relieved of all doubt as to the vitality of the seed.

Up till the time when the seed begins to sprout we consider cellar storage ideal. After that it is faulty because every sprout formed in cellar storage is almost sure to be broken off, thereby weakening the seed just to that extent. But as I have pointed out, the real damage occurs where potatoes are stored in a solid mass and allowed to sprout, filling up the air spaces, causing them to heat, resulting always in a poor stand, and disastrously to the grower. I. L. WARE.

Maine.

R. N.-Y.—This refers to very late planting in Maine—long after danger from frost is over. In latitude farther south, where potatoes are often planted before danger from frost is over, this advice to spread on the open ground would have to be modified. The formaldehyde treatment is always good insurance. The main idea involved—that of avoiding long, weak sprouts, that impair the potato's vitality, holds good in any case.

TEMPORARY PASTURE FOR ONE YEAR.

NOW the season is over and our farmers have felt the need of temporary pasture, may I offer the suggestion below, which is strongly recommended by the Ontario Agricultural College, Canada, and has been found very effective?

A good temporary pasture can be used by sowing the following: 51 pounds oats, Early Amber cane 30 pounds, common Red Clover, seven pounds, making a total of 88 pounds per acre. The oats and cane are mixed together, and are sown from the grain box of the seed drill, and the clover is sown from the grass seed box placed in front of the tubes of the drill. If the mixture is sown about the first week in May, it is usually ready for pasture about the 20th of June. The oats are early and rapid in growth; the cane is later, and the clover forms the principal pasture in the Autumn.

Pasture for two years: Red clover, six pounds, Alsike clover, three pounds, Orchard grass, three pounds, Meadow fescue, three pounds, Timothy three pounds, making a total of 18 pounds per acre. This mixture can be sown in the Spring, either with or without a grain crop the clover and the Timothy from the grass seed box, and the Orchard grass and fescue by hand. It could be used as a hay crop the following year and for pasture after. F. K.

Connecticut.

Now the Australians are planting citrus fruits, expecting to send oranges to the American market. The Spanish government will also send commissioners here to see if a market for Spanish oranges can be found!

Indian Meal-Moth in Dried Fruit.

WILL you give a remedy for "millers" and "worms" in raspberries? After evaporating my berries I spread them on a floor upstairs in the house and the room is filled with "millers" and there are eggs and worms in the berries. W. M. B.
Watkins, N. Y.

Dried fruits of all kinds, raisins, currants, peaches, plums, apricots, and others are liable to become infested with an insect commonly known as the Indian-meal moth. Undoubtedly the insect responsible for the injuries to the dried berries referred to in the foregoing letter is the same meal-moth. The Indian-meal moth is distributed all over the United States and as Holland says "has a propensity to feed upon almost anything edible that comes its way." In addition to feeding on dried fruits it will attack meal, flour, crackers, and almost any cereal. The whitish or pinkish larva has the pernicious habit of spinning a web wherever it goes, which entangles the particles of food, binds them together in a webbed mass and makes the material unfit for food. This is especially true of cereals like flour and meal. The small white eggs are laid singly or in groups of a half dozen or more on the material upon which the insects happen to be working. In a few days the eggs hatch and the larvae mature in hot weather in about three weeks. There may be several broods during a season, thus enabling the insects to increase very fast and become exceedingly numerous in a comparatively short time.

In this particular case, probably the best way to destroy the insects is to place the fruit in a tight barrel or box and fumigate it with carbon bisulphide. The liquid should be used at the rate of two pounds to 1,000 cubic feet of space. For an ordinary barrel a teacupful should suffice. The liquid should be poured into a shallow basin and set on top of the fruit to stand there and evaporate. The top of the box or barrel should be covered with moistened newspaper and then a thick blanket or two to keep the gas from escaping. Care should be exercised not to go near the box or barrel with a light of any kind until after the blankets have been removed and the gas has dissipated itself. Carbon bisulphide is explosive and inflammable but otherwise is not dangerous. It will not injure the dried fruit.

GLENN W. HERRICK.

Breeding Habits of Snakes.

In order to settle a dispute, will you tell us whether snakes lay eggs or bear living young? J. S.

Snakes may be classed roughly as oviparous or viviparous. The former lay eggs and the latter bear living young. There is no hard and fast line between these groups, as some species lay eggs in which the young are already well developed and which, therefore, are not long in hatching. An example of this class is the ring-necked snake. The eggs are known to have hatched in a period of 41 days from the time of laying. Among our common oviparous snakes are the hog-nose snake, or spreading adder, the common black snake, fox, chicken, and milk snakes. The eggs of these snakes hatch in periods varying from six to 11 weeks. The coral snake is an exception among poisonous species in that it is oviparous. The incubation period is about 12 weeks.

The water and garter snakes and most poisonous species, as the cotton-mouth, copperhead, and rattlesnake, are viviparous. So far as we know there is no data on the exact length of gestation in these snakes. As stated above, the viviparous is not entirely distinct from the oviparous habit. Instead of saying that these poisonous and other viviparous snakes bear their young alive we may just as well say that they retain the eggs within the body until they are hatched. If one of the snakes is cut open during an advanced state of gestation it will easily be seen that this is the exact state of affairs. It is probable, therefore, that the duration of gestation in these species is not strikingly different from that of incubation in the egg-laying snakes.

Assistant Biologist.
U. S. Biological Survey.

THE GARDENS OF THE EAST.

CLIMATIC DIFFICULTIES.—I have just returned from attendance upon the seventh annual meeting of the Vegetable Growers' Association of America. It took 1,100 miles of railway travel, and I was only gone 100 hours from home, yet I feel that I have never made so profitable a trip, as measured by what I saw and the enlarged grasp I got on the problems connected with feeding the so-called non-producing class. I saw that the difficulties attending the treatment of farming as a fixed science either in precept or practice are being greatly reduced by up-to-date gardening as practiced in supplying the great eastern cities with food. Ordinarily everywhere climatic conditions make crop production a gamble every minute of the time, and often labor, seed and fertilizer are buried in a grave which under favorable conditions would have been a teeming birthplace. Many generations ago gardeners made a climate wholly under control by inclosing small areas under glass. Now many acres are under glass near every city of any importance.

FLOWERS BY THE ACRE.—I visited such a place near Baltimore on my way, where 267,000 small geraniums were grown, and before next June more than 1,000,000 will be started at a time of year when all out-of-doors vegetation is dormant. Of the six acres of glass nearly one was housing 38,000 stock plants from which two girls were taking cuttings while another was sticking them in benches of warm sand. In the service room adjoining, six girls were potting rooted cuttings at the rate of 12,000 per day. In one house were thousands of dwarf hardy Chrysanthemums in five-inch pots just ready to bloom. These will be shipped to florists all over the country, and the customers who buy will enjoy their beauty and then plant them in the border, where they will give flowers for many years at a season when tender plants have succumbed to October frosts. Outside there was more than fifty acres planted to Cannas and Dahlias, and on the 5th of October the sight was gorgeous indeed.

VEGETABLE PLANTS.—The farm was not all flowers, however. In one block was growing 3,000,000 cabbage plants, the product of 60 ounds of seed. I was shown a bin containing bags of cabbage seed for future use, and I should judge that it would fill more than two barrels. The plants growing will be sold to gardeners along the bay north of Baltimore for immediate planting. The plants are set on the north side of ridges and the mild climate, made so by the proximity of the ocean, carries them through the Winter.

TRUCK UNDER IRRIGATION.—In the days following I saw at Bustleton, in the northeast portion of Philadelphia, and at Bridgeton, in southern New Jersey, practical examples of gardening carried on in direct disregard of weather conditions. Water forced through perforated pipes on tall posts gives a shower whenever necessary, the rain-maker being a large gasoline engine in the packing shed, whose wants are attended to with scarcely any loss of time by one of the helpers. At Bustleton celery under irrigation was a foot taller than that without, and at Bridgeton, where 55 acres were under irrigation, all sorts of crops were being grown. Strawberries had proved very profitable, the crop from one 12-acre field selling for $8,000. Catch crops of spinach and celery grown the year before had more than paid the expenses of labor in growing themselves, and the strawberries. For the water supply a very small, inoffensive-looking brook had been dammed, making a pond of a few rods in extent. The big, greasy, gasoline engine which turned this brook water into rain was an unsubdued "knocker," but it knocked with a purpose and got results.

OVERHEAD IRRIGATION.—There is no question that overhead irrigation has come to stay, and on any farm where there is an engine, a garden spot could be irrigated with a very little expense. Irrigation is especially valuable at transplanting time, and the opportunity to carry early crops through an April or May drought gives success in the place of failure. I should think that on Hope Farm, where spring water is found at the highest point that irrigation could be done by gravity alone.

WEEDING.—At the Skinner place just described, I was reminded of what I wrote recently in regard to weeds. A gang of 15 Italians were hoeing lettuce. They walked backward, each man hoeing three rows, but they were not hoeing any weeds which were big enough to see. They were hoeing to bring the particles of rich loam and humus into new combinations with the fertilizer. Incidentally they interfered with weed growth.

CHINESE CABBAGE.—One of the interesting things at this place was an acre of the comparatively recently introduced Chinese cabbage. This looks more like a huge bunch of celery than cabbage, having an upright growth with large midribs with numerous branches which clasp around the bunch and enclose a fine, well-balanced center. The quality is fine, but has the true cabbage taste, and the same pronounced perfume when decaying. A woman from Michigan who had her curiosity aroused by seeing some on exhibition at the Toledo meeting last year grew an acre this year, and sold recently 6,000 heads to a Detroit dealer for eight cents per head. It packs nicely in upright crates like celery, and seems likely to become generally grown.

SECOND CROP POTATOES.—One of the crops being considerably grown in South Jersey is late planted potatoes for seed. They are a second crop after mid-Summer garden crops, and were in very vigorous growth at the time of the excursion. Owing to drought they were quite backward in setting tubers, and would require considerably more warm weather to be a success this year.

LEGUMES FOR HUMUS.—I saw no evidence of Summer manure being accumulated anywhere in our excursions, except on one Philadelphia farm, where it appeared to be the accumulation of daily drawing from city stables. In South Jersey I was told that they were getting to depend upon legumes for humus and commercial fertilizers for plant food. We saw several fields of Crimson clover just beginning to make the ground green, and now and then patches of beans and peas. Corn grows to large size in South Jersey and they husk it before cutting, and then cut the stalks, and cut it so low that less than an inch of stalk is left above ground. I guessed, but do not know, that this closely-cleared ground was to be disked and sown to some cover crop.

L. B. PIERCE.

Pine Needles for Mulch.

I HAVE a small strawberry bed, and do not seem to have much available material for a mulch. Would pine needles answer the purpose? There is a pine grove near me and it might be possible to get into it with a team to draw them out. Would there be the objection of using them for bedding that there is with same quantity of pine sawdust? L. H.
Hartland, Vt.

The pine needles or "pine straw" as it is called in the South, will answer. In some parts of the truck section in the South this "straw" is largely used.

Pond Mud on Grass.

WOULD it be practicable to use pond mud on grass land to get a crop of hay? If not what would you advise mixing with it? D. W.
Foxboro, Mass.

A ton of the pond mud would contain about six pounds of nitrogen and but little potash or phosphoric acid. The best way to use it would be to haul out during Fall and Winter and put in piles well mixed with lime. Let it ferment or compost through the Winter, and spread thickly over the grass in the Spring. You ought to use in connection with it a fertilizer high in phosphoric acid, and as much potash as you can get this year.

THOMAS E. SHEERIN, NURSERYMAN, 21 Main St., DANSVILLE, N. Y.

Apples Among Grapes.

WOULD you advise planting apple trees in a grape arbor? I have more grapes than I want, and thought of planting Delicions apples and also some Duchess in the grape rows. Then when the tree gets of any size, I should take out that row. What is your advice? T. S.
South Bend, Ind.

It is never advisable to interplant apples with grapes; of course, it can be done, but as a rule not successfully. The root system of the vines being already well established it is an uphill fight for the apple roots to gain a foothold. Certain insects that are common to the grape feed on apple foliage when the latter is offered. Far better results can be obtained through tearing out entirely that part of the vineyard, and after turning under a green crop, as rye, clover, etc., plant the apples. F. E. GLADWIN.

Orchard and Hens.

I HAVE a five-acre orchard of young trees. The soil today is in nearly perfect condition. I have been a great believer in cover crops and have used in addition hen manure and commercial fertilizers. I have now a large flock of hens in the orchard. They have laid bare about half the orchard, and will be likely to complete their work another year. This renders cover crops impractical. Will the soil in time become deficient in humus? If so, what is the remedy? What needs to be done to such an orchard by way of fertilizing in addition to the presence of the hens in it?
Lynn, Mass. S. P.

We assume that this is an apple orchard. The hen manure will furnish much organic matter, but cover crops will help. Our plan would be to put temporary fences of high netting so as to divide the orchard into three parts. Seed two while the hens run in the third and change from one to another as the crops grow. You can sow at different times oats and peas, clover, rape, rye, wheat or buckwheat, and let the hens harvest the grain crops if you desire. Or you can raise corn with a cover crop in one part of the orchard by keeping the hens out until the corn has a good start. Different combinations of grains or other seeds can be used for this pasture. Hen manure is rather high in nitrogen to use alone for an apple orchard. It will cause too much wood growth and rather poor color. We should use 400 pounds per acre of a mixture of 300 pounds acid phosphate and 100 pounds muriate of potash.

S. S. M.

Cherries Fail to Bear.

I HAVE one sour cherry tree and one sweet Windsor; both are healthy and thrifty growers. I spray them every year. They blossom well, but neither sets any fruit. The sour cherry tree had a few quarts; its age is about 20 years, and the Windsor about 12 years. What would you advise to do to get fruit? Girdling, I believe, would kill the tree. S. L.
Allentown, Pa.

If a cherry tree will not set fruit up to even 10 years from planting I would topwork it to some variety that is known to be a reliable bearer. The Windsor is usually a good bearer without the aid of the pollen of any other variety, and this tree may not be true to name. In any case I would graft both the trees to other kinds next Spring. The Schmidt would be a good one for the Windsor tree, and Montmorency for the sour one. Scions should be secured about the month of March and put in damp, cool storage until the buds start on the trees to be grafted, when the work should be done. Late grafting with perfectly dormant scions is better for stone fruit trees than early grafting in the Spring. Girdling the trees would be fatal.

H. E. VAN DEMAN.

Top-working Quinces.

I HAVE several hundred quince trees which were set out six years ago for Orange quince. They have turned out to be a variety which apparently will not mature in this section. Is it practical to have these trees grafted or budded? Or should they be pulled out and reset?
Williamson, N. Y. P. H. V.

There need be no serious difficulty in grafting over the quince trees to the true Orange variety, which is the one usually of most value for growing in New York. The later kinds do not always come to full maturity then, and the trees complained of must be of that character. The greatest care should be used to secure scions from trees of the Orange variety that are in bearing, and no doubt of their correctness. The grafting should be done next Spring. H. E. VAN DEMAN.

Rot of Hyacinths.

I HAVE a flower bed 4x12 feet that I used a number of years, for hyacinths, but two years ago the bulbs practically all rotted after blooming. I took them up every year or so after the leaves died, and replanted later, and occasionally added some new bulbs. The soil is good leaf mould, and I wish to plant hyacinths again after waiting two years. Would it be safe in the same soil, or would a treatment with lime-sulphur, Bordeaux or pure sulphur render it suitable to plant them?
Carthage, Ind. T. T. N.

I have never had experience with the trouble mentioned with hyacinth bulbs rotting, though results are not very satisfactory if old bulbs are used season after season. New bulbs may correct the trouble, though a good coat of lime may help put the soil in better condition. I do not think sulphur or Bordeaux mixture would be of any benefit. Growing a heavy crop of oats or rye and digging down when eight inches to one foot high might help in addition to the lime, though, new bulbs would be best. E. J. W.

Peaches for Columbia Co., N. Y.

WILL THE R. N.-Y. state what it deems a good assortment for a peach orchard of 400 trees in this vicinity, for commercial purposes, and in what proportion for each variety? This section is only moderately a peach country, but I have a three-year-old apple orchard on ground that I am cultivating, but that is too rough to intercrop, so I plan to put in the peach trees as fillers—apples set 45 feet apart—with little loss of labor aside from pruning and spraying and no loss of ground. S.
Columbia Co., N. Y.

We are in the lower part of the Hudson Valley, and find the following varieties profitable: Carman, Belle of Georgia, Mountain Rose, Elberta or J. H. Hale, Chair's Choice, Salway, Iron Mountain. We think J. H. Hale is to take the place of Elberta. Carman and Belle of Georgia pay us best, though in a season like the present one Salway as a late peach is very profitable. These varieties may not be at all suitable 100 miles north of us, but they do well here. We shall not put any more peach trees as fillers among apples, as we have become convinced that Wealthy or other apple varieties of that shape, are much better.

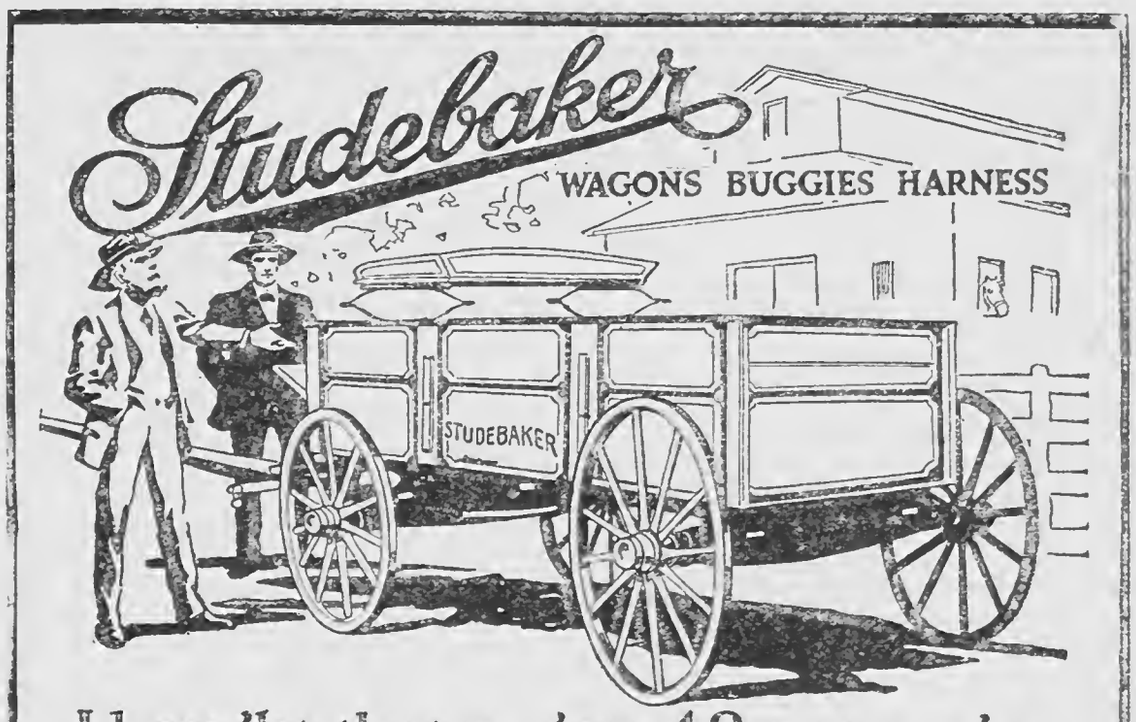
Corn With Defective Ears.

I NOTICE on page 1209 J. B. inquires for reasons why Golden Bantam sweet corn fails to fill out properly. I have planted Golden Bantam, Evergreen and Kendall's Early side by side on soil that had not been plowed previously for at least 25 years. The two latter varieties filled out perfectly, but Golden Bantam failed to do so. This would seem to indicate that Golden Bantam needs something more than the other or "white" varieties require, I think, and I hardly think this thing is potash, either, because, by pure chance, I put an application of kainit where the Golden Bantam was planted, and not on the remainder. Perhaps the soil needs lime—I am sure mine is too acid. If J. B. will tell how long it has been since his soil has been limed and how much has been done in the way of green manuring perhaps we can find the answer. W. P. M.

WANT TO KNOW.

WHO can tell the weight of a cord of hard and soft wood—say hickory or white oak and chestnut, green or dry, or both?

HAVE readers of THE R. N.-Y. any experience in the use of dynamite for draining out small swamps in our New England meadows? My side-hill farm has an average of perhaps a 15-degree slope and there are many small swampy places covering from a few square rods to half an acre or more. In hardly any case is there running water in them, but much of the time they are too soft to work. About two feet below the surface in these places I find hardpan, which I imagine from the general formation in this section is underlaid by solid ledge. I have read of some who have drilled through the hardpan, and by using dynamite to break and loosen it have drained out certain types of soil. Where there is gravel under the hardpan I can see that it would work, but would it in my case with the possibility of ledge? In the successful cases how permanent is the method? Does it not have to be repeated after a time? If any one has had experience in a like case and can give me any advice I would be greatly obliged. L. H.
Vermont.



I bought that wagon 48 years ago—
Use it every day—it is a Studebaker

A WAGON that has been giving its owner adequate service for forty-eight years would be considered a wonderful wagon *if it wasn't a Studebaker.*

Thousands of Studebakers, forty years old, and more, all over the United States, are making money for their owners every day. Here is a letter from dealer William Nevenheim who reports on a Studebaker wagon owned by David Clark, of Bemis, South Dakota:

"I have a customer here, Mr. David Clark, who owns a Studebaker wagon he has used constantly since 1865. Mr. Clark bought this wagon from G. W. Howard, Gilenton, Wis.
"The wagon is in actual use every day."

STUDEBAKER WAGONS *ALWAYS* LAST

We have thousands of letters from all parts of the United States furnishing proof that thirty-five and forty years of life are nothing unusual for Studebaker wagons.

—and the Studebaker wagon you buy today is better built than the Studebaker wagon of 1865. Improved machinery makes it so.

Don't accept any other wagon represented to be "just as good" as a Studebaker. The substitute may be cheaper but it isn't up to Studebaker standard and you can't afford to buy it.

Studebaker Wagons, Buggies and Harness have equally good records.

Studebakers last a lifetime

That Red Ball Means Longer Wear—Greater Comfort

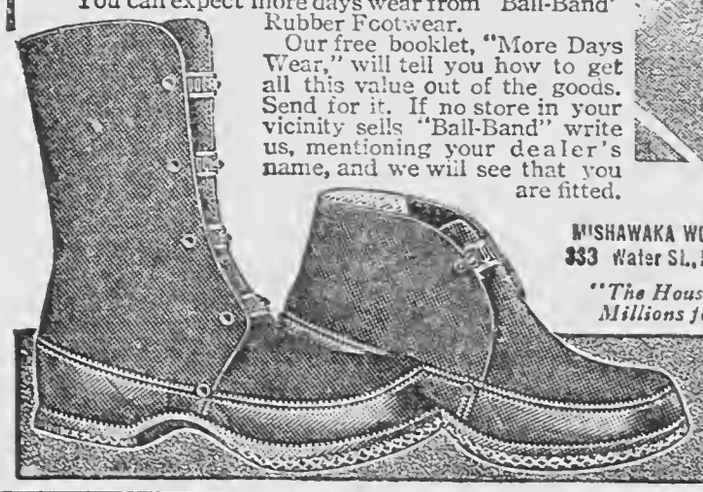
"Ball-Band" Rubber Footwear, the kind that bears the Red Ball, is made over a natural last, to make a snug, easy fit more certain. Points that are weak on other footwear are reinforced and made the strong points of "Ball-Band."

Look for the Red Ball

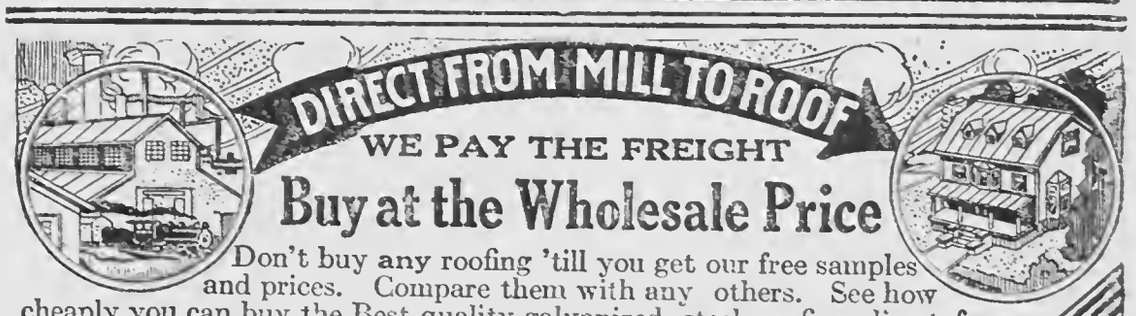
"BALL (Red) BAND"

You can expect more days wear from "Ball-Band" Rubber Footwear.

Our free booklet, "More Days Wear," will tell you how to get all this value out of the goods. Send for it. If no store in your vicinity sells "Ball-Band" write us, mentioning your dealer's name, and we will see that you are fitted.



MISHAWAKA WOOLEN MFG. CO.
333 Water St., Mishawaka, Ind.
"The House That Pays Millions for Quality"



Buy at the Wholesale Price

Don't buy any roofing 'till you get our free samples and prices. Compare them with any others. See how cheaply you can buy the Best quality galvanized steel roofing direct from the Mill—and keep the Dealer's profits in your own pocket. Our roofing resists fire, is proof against lightning and the elements, requires no repairing and gives longest wear. Can be laid over old shingles, prepared roofing or nailed to rafters. Anyone can put it on, without special tools. Strengthens old buildings and makes them look like new.

Guaranteed Steel Roofing

Corrugated Roofing

We Guarantee every sheet to be full weight, first quality open hearth roofing steel; coated by our exclusive process extra-thick, extra-tight galvanized coating, free from flaws and brand new—OR IT DOESN'T COST YOU A CENT.

Get our Free Samples and Steel Roofing Book before you buy ANY roofing. Test these samples in every way, notice the heavy galvanized coating which will not flake off nor crack. We want you to make every possible comparison, because we know it will prove to you that our roofing is the best and most durable.

We will send full instructions for measuring and applying. WRITE US TODAY.

LEGAL QUESTIONS.

Distribution of Personal Property.

WHAT is the law in regard to personal property in the States of Massachusetts and New Hampshire? There are no children. Husband and wife both have personal property in their names. In case of death of husband what part of his personal property would wife get? In case of wife's death what part of her personal property would the husband get?
Massachusetts. G. W. H.

In case of death of the husband the wife would get in Massachusetts such parts of the personal estate as the Probate Court may allow as necessary for the widow and for reasonable sustenance of the family and the use of the house and furniture for six months after death; then, after the payment of debts, funeral charges and expenses of administration, and where there are no children as in this case, the sum of $5,000 and half the remaining personal property or the whole if there are no kindred. The husband's rights are in the personal estate of his deceased wife after the payment of debts, etc., the same, to-wit: $5,000 and half the remaining property or the whole if there are no kindred.

In New Hampshire the surviving husband or wife of a decedent is entitled to the following share of the personal estate: one-third if decedent leaves issue by such survivor, but if decedent leaves no issue $1,500 where value of whole does not exceed $3,000, and one-half where such value is in excess of $3,000. M. B. D.

Wife's Interest in Real Property.

My parents owned real property in New Jersey to the value of about $7,000. Recently my mother died without making a will. This property is free from debts. The family consists of one girl of age and six boys, four being minors. Father has a buyer for this city property which he wishes to sell, and with the proceeds buy a farm in New York State on which he has an option. To this we all agree except my oldest brother, who wants the property to stand as it is, and contends that the property cannot be sold without his signature. I am next oldest son, my father wants my assistance to take up farming; this I am willing to do, but before going north I wish to know what there is to the argument my brother puts up. G. M. C.
Florida.

Very little real property is held in the names of both husband and wife and if your parents held this property in that way it is a bit unusual, and before any definite answer to your inquiry could be made it would be necessary to know whether the deed is in the name of your father or was to your father and mother. If the latter be the case, your father would seem to have his right of courtesy in your mother's share for his life and then it would descend to the children, but if the title is in your father alone, your brother at this time would have no interest in the matter, and can take no steps to interfere with the sale of the property by your father. And if it were owned by both your father and mother, there seems to be no objection to a partition of it and a division of the proceeds. Your brother individually cannot indefinitely hold up a sale where all the other parties consent. If your brother is serious in his objection, it would be well to consult good local counsel.

Descent of Wife's Property.

I have a neighbor who has raised her family. Eighteen years ago her husband gave her a quit-claim deed for their home when it became apparent that she must put in not only all her inheritance from her parents, but a lifetime's hard work to save it. She now wishes to know, should she die before her husband, if her children will inherit the home, or if she must will it to them in order that they should inherit it, and if her husband has a lifetime interest therein. G. M. R.
Ohio.

She can accomplish nothing more by a will than she can by not leaving one. In either event, the property would go to the children, with the exception that possibly the husband would have a dower interest in one-third of her real property for his life, even though he has given her a quit-claim of the property. If he has a dower interest, she cannot defeat it by will and, if he has none, the property will descend entirely to the children. Dower rights of husband and wife are equal in Ohio.

JUDGE: "Where did the automobile hit you?" 'Rastus: "Well, judge, if I'd been carrying a license numbah it would hab been busted to a thousand pieces."—Puck.

ALL SORTS.

Tar for the Bats.

THE house in which I live was badly infested with bats when I bought it. I got rid of them by daubing tar or rather a roofing paint, of which I had plenty, on their roosting places and saturated rags with the tar and stuffed into all cracks and crevices which they used. The tar will gum their wings so that they cannot fly. They will not come back into that sticky place until it gets dry. Many will die from this treatment. Any other sticky substance would probably do as well. All cracks should be stopped up some way so that they cannot come back after the tar dries. Brick houses, if old, are the hardest to fix, but it can be done. Sharpen an old steel umbrella stay and spear them out of the cracks around the window casings. Keep up a persistent war on them and show no mercy. Sulphur will drive them out, but they will come back as soon as the smoke disappears. Don't neglect to keep all holes and crevices stuffed with tarred rags. In fact tar everything that they occupy. The bat may be all right in his place, but no man cares to have them by the thousand in the attic as we had them.
Iowa. D. W. FORD.

Expense of Vaccination.

I SAW an article in THE R. N.-Y. in regard to the vaccination of children in public schools. Whose place is it to pay charges, the district or parents?
New York. N. G.

Regulation 31 of the new sanitary code for the State of New York says that "It shall be the duty of the board of health of every municipality to provide, at public expense, free vaccination for all persons in need of the same." As it is the duty of school trustees to see that the compulsory vaccination law is enforced in their districts, provision for vaccination of the school children seems to devolve upon them, and in this vicinity trustees of district schools are employing physicians to inspect their schools and vaccinate such children as have not been vaccinated at the district's expense. I am not sure but that, under the sanitary code, the expense of vaccination could be placed upon the municipality in which the school is located, rather than upon the district; that is, upon the town or village. But, as the taxpayers of the districts making up the municipality would bear the burden, in any event, this would seem to be immaterial. M. B. D.

Hiving Wild Bees.

THERE is an old tree of little value on my farm containing a swarm of bees. I would like to cut the tree and secure the swarm for a hive. What would be the best way to do this, and would it pay better to keep these bees if I could get them into a hive than to buy a swarm? I have never kept bees.
Philadelphia, Pa. F. M.

It would be hardly practical to secure these bees and sufficient brood and honey for a hive so late in the season; you will probably find it more satisfactory to cut the tree and secure what honey there may be without attempting to save the bees. Bees should be transferred sufficiently early in the season to permit them to build up their colony and provide Winter stores before the honey flow for that season ceases. They may, of course, be helped out by artificial feeding, but this should not be depended upon. Better make your start by buying a newly hived swarm of bees next Spring. M. B. D.

Cost of Horse Power.

IT costs the farmer a fraction over 10 cents an hour for each hour's work done by a horse, according to the figures of an Illinois farmer. Further, this farmer discovers that 2½ hours a day is the average time each horse works. The total cost of feed annually is $68.70 the horse, and other charges, such as pasture, maintenance of buildings, labor, interest, shoeing and sundries made the amount of maintaining a single animal for a year reach $92.30. He was in position to figure on increase in value on horses, while on the average farm there is a depreciation charge. He credited to the horse this increased value, the value of the manure, and the net cost of maintaining the horse amounted to $87.50. It is apparent the cost of maintenance of a horse is practically the same regardless its efficiency. It is evident the farmer should equip his farm with mares, or have at least part of his horse power such as could produce young stock and credit him with annual increase in value. Many farmers could dispense with one or more horses, reduce or rearrange their farm equipment so as to accomplish the same work with less horses, and be dollars ahead by the reduction.

The Question of Fence.

WE have been taking an auto trip through Palatine, St. Johnsville, Rome, Camden, Richland, Pulaski, Mexico, Syracuse and Utica, taking in many places that lie between, with views of Lake Ontario and a visit to the State Fair. We passed through some fine farming sections, and noticed that in these sections there were no roadside fences, beautiful fields of corn, buckwheat, potatoes and fruits with no protection, and yet I could not find one hill of corn that had been disturbed by passersby. We also noticed the pastures were well fenced, and that set us thinking. "They do not pasture their meadows," which we do not believe in, and so the crops are better and they need no fencing. What a contrast the poorer sections with their high roadside fences and poorer crops, not that we do not think the soil has most of all to do with it. But it all set us thinking of the possibilities of improvement even in the poorest sections. F.

Heating Inside Air.

ON page 1165 M. B. D., in describing his hot air furnace, says he takes his cold air from inside the house. There may be a little economy in doing this, but I doubt it. Fresh air heats much easier than foul, and by doing so he is losing the one great advantage that hot-air heating has over all others, that is, a steady supply of good fresh air, nicely warmed and furnished all over the house. All other systems, steam, hot water, etc., simply warm the old, stale, vitiated air, over and over again, and require some expensive method of ventilation to make them satisfactory and healthful. A. D. M.
Maine.

The criticism of the method of taking cold air from one of the rooms of the house would be perfectly valid in the case of an assembly hall, school room, or other place where a large number of people rapidly vitiated the air, but the writer doubts whether it holds good in the case of an ordinary dwelling. The supply of fresh air in most farmhouses is being constantly renewed through the numerous cracks about ill fitting doors, windows, etc., and the number of people who contribute the waste products of respiration to it is small in proportion to its quantity. While the plan of re-warming air cannot be considered ideal from a sanitary standpoint, its advantages probably outweigh its disadvantages and with the frequently opened doors and leaky walls it can hardly be called unhealthful for a small family in a large house. M. B. D.

The Purchase of a Patent.

I WAS very glad to see in a recent issue of your paper a hint at what I consider one of the most potent causes of our high cost of living, i.e., the fixing by the wholesaler of retail prices to the consumer sufficiently high to cover a profit to the retailer and all average losses, *bad accounts*, shrinkage, etc., and have been hoping for a wider discussion of this particular phase of the matter. It also occurs to me to ask if it would be possible for the Federal Government to withdraw its protection, as afforded through the patent laws, from all patents, the products of which, are so manipulated as to cause unduly high prices to the consumer. Nearly all of the staples are controlled by the so-called trusts by reason of their ownership or control of patented devices cheapening the cost of production. With a lot of these patents free for anyone to use competition would soon relieve us of some of our burdens. J. W. BARNEY.

R. N.-Y.—Some of these things are attempted in the new anti-trust law. Recent decisions of the Supreme Court have decided that the holder of a patent cannot dictate the price at which the retailer sells his articles. Formerly such a dealer was obliged to agree that he would not sell below a certain fixed price. There has been for years a growing belief that the government should have the right to buy, for the benefit of the public, any patent which becomes an extortionate monopoly. This would not be confiscation, but it would mean paying a fair valuation and then making the patent free.

DRY WELLS.—You do not give sufficient information for a good guess why J. I. C.'s well, page 1149, went dry. Blasting within five miles may cause a crack to open in the rocks and give the water a new passage. I have known operations 15 miles away to dry wells in Colorado. Near my home, wells 1300 feet deep, at a State institution, have dried all wells and springs for a mile radius. They force constant big streams, by air lifts, working night and day to take all the water. J. I. C. may look around within five miles and find the cause better than strangers can guess. J. G.
Norristown, Penn.

Canvas Covers—wagons, hay stacks machinery, boats, waterproof duck. Heavy canvas for all purposes at low cost. 10 oz. wagon cover 7½ x 12 ft., $3.80 prepaid. Write for prices stating size required. W. W. STANLEY, 50 CHURCH STREET, - - NEW YORK

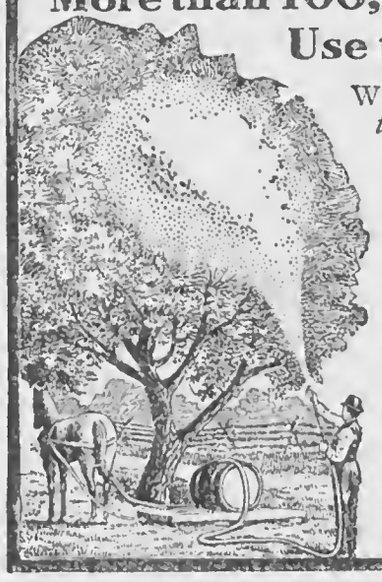
More than 100,000 Farmers and Fruit Growers Use the STANDARD SPRAY PUMP



With it they spray their tallest orchard trees *from the ground* in half the time required by others. The knapsack attachment enables them to spray their potatoes and low growing crops at the rate of an acre an hour or better. They whitewash their barns and chicken coops and spray "dip" on their live stock with the Standard Spray Pump.

Made throughout of brass, with nothing to wear out or break, the Standard Spray Pump lasts a lifetime and pays for itself over and over again.

Warranted 5 Years. Price $4 Prepaid. (West of Denver $5.) Money back if not satisfied.

Send no money but write today for our Special Offer and Catalog M.

The Standard Stamping Co.
1948 Main St., Marysville, O.

Care of Harness.

WILL you give a good method for keeping harness in the best condition? What oil, etc., is best to use, and how should it be applied? How about the harness soaps and other preparations on the market? T. H. H.

Hillards, Ohio.

My method for cleaning and oiling harness is as follows: Unbuckle every strap, pack in tub, scatter on a handful of washing powder, cover with warm soft water, let stand 30 to 60 minutes, then remove dirt and sweat with coarse cloth, and rinse with clean water. Allow leather to get nearly dry, then apply a blacking made as follows: Two quarts soft water (hot); two ounces extract of logwood; 12 grains bichlorate of potash. When dry apply an oil prepared as follows: One pint neat's-foot oil, one-half pound beef tallow (melted). Apply with brush, rub in well. One application is sufficient if harness is treated as above every six months. The blacking being underneath the oil will not rub off. No better preparation for harness can be made at any price. Most harness soaps are good for cleaning harness after they have been well oiled, should be used often and will keep harness in good condition. Most other preparations are of very little value as preservatives to leather, as they are principally made up with crude petroleum, lampblack, etc. H. A. L.

Linesville, Pa.

Contaminated Well.

A TENANT a few years ago let a cow get in a well which was unused, and said nothing about it. As the well was a good one, and the water badly needed this season, I had it cleaned out. The water in it is very foul. Will pumping it out a few times cause the water, by aid of chemicals, to be fit to use for stock again? J. B. A.

Illinois.

If the water in this well is foul from the presence of decaying matter of any kind, it may be made fit for use again by a thorough cleaning out of the well after pumping it dry. If the water remains foul after the well has been cleaned it is evidence that there is some other source of pollution, and search should be made for such possible source in an adjoining manure pile, privy vault or accumulation of surface water which may find its way into the well. Chemicals should not be depended upon to purify water which is being fouled by some foreign matter gaining access to it. M. B. D.

Lessons from the Vegetable Growers' Convention.

THE seventh annual convention of the Vegetable Growers' Association of America, recently held in Philadelphia was a signal and all-inspiring success. The attendance was large, the reports of the various standing committees showed labor and painstaking care, the addresses and discussions were lively and thorough. The exhibition of gardeners' supplies and equipment were more complete and better installed than at any previous meeting. One commendable feature of the convention was the agricultural college exhibits showing various phases of the work in vegetable gardening. The State colleges of New York, Illinois, Pennsylvania, Ohio, Oregon and Maryland were represented. The largest exhibit of vegetables was that made by the Philadelphia Vegetable Growers' Association, but there were several others not far behind in quantity and quality, and some were even more attractively staged.

Among the subjects that were most exhaustively presented and which elicited the most general discussion were marketing, soil fertility, standardizing weights and measures, improving the nomenclature of vegetable varieties, and co-operation.

Under the title of "Soil Problems for Vegetable Growing," Dr. Lipman, of the New Jersey Experiment Station, urged the importance of selecting a location for gardening that would meet definite conditions as to soil moisture, soil temperature, soil ventilation and soil texture. Having found the location, the grower should place and keep the soil as far as possible under the conditions demanded by his various crops. In other words, the vital needs of the soil must be met if it is to continue to bring forth a full return in the way of produce. The vegetable grower cannot depend upon commercial plant food alone, but must supplement this with stable or green manure. It is very difficult to maintain soil moisture and soil texture conditions with commercial fertilizers alone. On the other hand, too much stable manure is sometimes used, and the soil fails to respond. Under such conditions stable manure should be withheld for a year or two, and commercial fertilizers used. If the soil is acid a moderate dressing of lime will prove of value. The war in Europe has cut off our principal source of supply of potash. It is estimated that the supply on hand is less than 30 per cent. of the usual stock. To a great extent the same is true of garden seeds. If the war continues for another year the situation will become serious, unless we boldly face the question and supply these needs ourselves.

In discussing the great economic question of marketing no attempt was made to solve the "high cost of living" problem, and no time spent in simply denouncing middlemen. Two things would greatly facilitate and improve market conditions; one is better crops, and the other is better means of distribution. The time and means spent in trying to grow crops where only half or quarter crops are made, is one heavy item on the wrong side of a vegetable grower's balance-sheet. The expense of marketing even a good crop is often another serious obstacle to success. While much can be done by using the parcel post trolley-car, express and freight shipments direct to consumers, yet the fact remains that in our large cities many persons will be required to serve as agencies in the distribution of farm and garden produce. While eager for information, the Vegetable Growers' Association will not endorse any scheme or method of marketing that has not been tested and its merits proven. Coöperation in some form seems to be the ideal plan in selling as well as in buying. It was thought that neighborhood or more local markets in large cities were better than large terminal or central markets, and that the trolley freight might be one efficient means of cheapening and quickening distribution.

One of the most instructive features of the convention was a round table discussion led by Prof. Work of the New York State College of Agriculture. Some of the points brought out were that co-operation is simply a union of the means and efforts of many to accomplish results that benefit all. In beginning a coöperative effort it is well to commence on a small scale. In many a community vegetable growers could get together and unite in buying seeds, fertilizers, and other supplies, or for simply exchanging experiences and observations. In this way they get acquainted and learn to trust each other. Confidence and loyalty are absolutely essential in all co-operative enterprises. In many places vegetable growers could improve and control their market facilities by a united or co-operative action. When the right attitude or spirit is developed then the larger activities like grading, packing and shipping products by the carload can be entered upon.

The Association elected the following officers for the ensuing year President, M. L. Rueterik, Cleveland, O.; secretary, S. W. Severance, Louisville, Ky.; treasurer, E. A. Dunbar, Ashtabula, O The most encouraging lesson of the convention is the evident fact that the vegetable growers are no longer blindly devoted to a routine which has ceased to be either economical or judicious. The methods of the pioneer gardener are not adapted to the changed circumstances of his grandchildren. We are infusing more thought, more study, more science into our work, and this can scarcely fail to incite an ever increasing number of young men to feel a greater pride in their calling and to take a livelier interest in everything that tends to improve and dignify it.

WILLIAM R. LAZENBY.

Ohio State University.

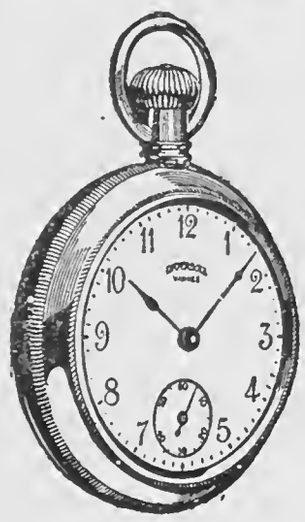
SOIL MANAGEMENT; by F. H. King, 303 pages; illustrated; published by Orange Judd Co., New York. This book is a result of the extensive investigations of the late Prof. King, one of the greatest soil experts. It is a fitting supplement to his other books, "The Soil," "Irrigation and Drainage," and "Farmers of Forty Centuries." Some of the subjects discussed in "Soil Management" are: Productive capacity of fields; Soil moisture and plant feeding; Principles of earth mulches; Physical features of soils; Why lime soils are strong; Reclaiming swamp lands, etc. For sale by THE RURAL NEW-YORKER; price $1.50.

RURAL IMPROVEMENT; by F. A. Waugh; 259 pages; many illustrations; published by Orange Judd Co., New York. Prof. Waugh is well known as a teacher and practical authority on horticulture and landscape gardening. The purpose of this work is to improve the appearance of country homes, villages, school grounds, small parks, etc., and stimulate wholesome recreation and neighborhood social intercourse. All of these things can be done with but little expenditure of time and money, and are certainly worth while additions to the comforts and pleasures of country life. For sale by THE RURAL NEW-YORKER, price $1.25.

FARM ANIMALS; by Hunt and Burkett; 526 pages; fully illustrated; published by Orange Judd Co., New York. This book is well adapted to school use or the farm library, as it covers in concise and convenient form practically the whole live stock field, breeds, feeding, sanitation and production, with a chapter on farm butchering. For sale by THE RURAL NEW-YORKER, price, $1.50.

MARIE: "At the place where I was spending my vacation this Summer, a fresh young farmer tried to kiss me. He told me he'd never kissed a girl in his life." Ethel: "What did you say to him?" Marie: "I told him I was no agricultural experiment station."—Boston Transcript.

Ingersoll Dollar Watch



It's Guaranteed!

The shrewd buyer always gives preference to an article that is guaranteed, but he expects to pay a little more for the insurance.

The Ingersoll is the world's standard Dollar Watch, sold at the same price in every store from Maine to California.

The biggest value as a timekeeper in the watchmaking industry and its big broad guarantee adds not a cent of cost.

15,000 Ingersoll watches are made every day, so uniformly and perfectly that the guarantee adds practically nothing to the expense and nothing to the cost of the watch.

It is the best watch at any price for the man outdoors.

Look sharp for the name "Ingersoll" on the dial—the mark of the good time-keeper.

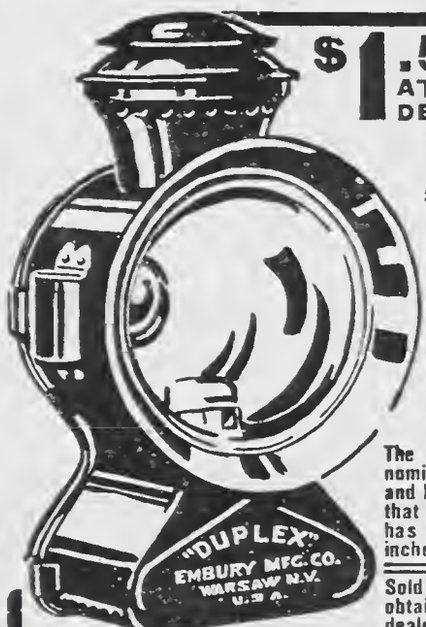
KODAK

Show your friends

the Kodak pictures you have made of amusing incidents about home, of the boys and girls at play, indoors or out—flashlights of the interior of the house, of parties or socials—portraits of the family and even pictures of fruit or plants,—in every one of these there is something to recall—something worth while.

Ask your dealer for booklet "At Home with the Kodak," or free by mail. It tells how to make portraits and interiors. Kodaks and Brownie cameras $1.00 and up.

EASTMAN KODAK COMPANY,
387 State Street, ROCHESTER, N. Y.



$1.50 AT YOUR DEALERS

With optical lens. 50c. extra.

This beautiful lamp made especially for your night driving. Fits on either side of the dash.

CAN'T blow out or shake out.

The most economical, brilliant and handy lamp that your dealer has in stock. 9 inches high.

Sold direct if unobtainable from dealer.

Write us for copy of the New State Law regarding lamps on vehicles. We send it FREE to you.

EMBURY MANUFACTURING CO.
WARSAW, N. Y.

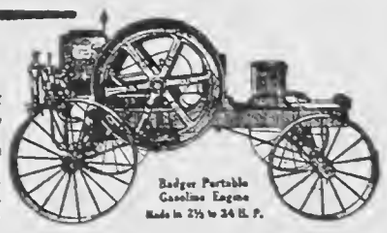
Make Your Own Drain Tile

THE FARMERS' CEMENT TILE MACHINE

Makes tile 3 to 8 inches in diam., 12¼ inches long. One man or boy operates it by hand or power. 500 tile per day by hand, 1,200 by power. Tile thoroughly cured by patent process. No tamping or use of pallets. This machine and tile used by Experiment Stations of Agricultural Colleges and the U. S. Dept. of Agriculture. 5,000 farmers have doubled the yield of land by underdrainage, and saved 75% of cost by using our Machine. You can do the same. Save cost of hauling and breaking. Make perfect tile $3 to $5 per thousand. MACHINE SOLD DIRECT FROM FACTORY TO YOU. TEN DAYS' FREE TRIAL. SEND NOW for 36-page Illustrated Catalogue. Tells you about great benefits of underdrainage, how to take levels and get grades, make and lay your tile at low cost.

FARMERS' CEMENT TILE MACHINE CO., - Box 604, ST. JOHNS, MICH.

Feed Grinding and Wood Cutting



In the Winter every farmer finds himself beset with numerous jobs—big and small—every-day jobs and occasional ones. This is where an efficient, reliable power plant is a time and money saver.

The "Badger" Engine is made well from start to finish: made to run without interruption; not merely to sell.

It is simple—anybody can run it or adjust it. It is economical, using less gas or gasoline than any engine known. It develops more power than rated. There are many types and sizes of "Badgers" to suit every individual need. Any BADGER is a GOOD engine.

Badger

The "Badger" is always ready to run—Winter or Summer—at an instant's notice. Every part guaranteed for five years unconditionally.

Send for Catalog. Free Engineering lessons sent on receipt of dealer's name.

Address The Christensen Engineering Co., Milwaukee, Wis.

Or J. B. NORTON CO., Inc., Distributors, 209 Elizabeth St., Utica, N.Y.

GASOLINE ENGINES

GOOD PROTECTION FROM FIRE, WIND, RAIN AND STORM is assured if your buildings are covered with

APOLLO ROOFING

APOLLO Roofing and Siding Products are highest quality, full weight, and reasonable in cost. Made from the well known APOLLO Best Bloom Galvanized Sheets, and sold by weight by leading dealers everywhere. Our interesting "Better Buildings" booklet sent free upon request.

AMERICAN SHEET AND TIN PLATE COMPANY, Frick Bldg., Pittsburgh, Pa.

A FARMER IN PALESTINE.

THE picture here given shows a farmer in the Holy Land coming home from his day's work. There is some contrast between this and the advent of a prosperous American farmer into the yard as the sun goes down. This man drives his team of big gray horses up from the field, and the boys go out to help unhitch. Mother stands at the kitchen door and past her comes a whiff from the hot biscuits and baked potatoes and baked apples. There are chores to be done, but that is in the day's work and soon over. The farmer shown in the picture comes in carrying the yoke. His wife or wives have no biscuits and honey for him. A few dates or dry wheaten cakes will be all there is for supper, and then a dull sleep to prepare for another weary day. The cheerful and bright home is the mainspring of the farm. "No place like home."

EVENTS OF THE WEEK.

DOMESTIC.—A five inch rain in less than four hours, Oct. 23, gave San Antonio, Tex., the most destructive flood in its history. Fifteen persons were drowned, 200 houses were destroyed and about 2,000 persons were made homeless when the San Pedro and Alazan creeks overflowed. The insignificant streams rose to raging rivers 500 feet wide, and swept houses, mostly small structures, from their foundations. The San Antonio River rose out of its banks, and in many residence districts spread over wide areas and flooded many streets. The property loss is estimated at $150,000, exclusive of damage to several bridges and other municipal property.

Four men were instantly killed and one mortally hurt at Hempstead, L. I., Oct. 23, when a six passenger touring car going at mad speed wrecked itself against a curbstone.

Dr. Richard C. Flower, who managed for 11 years to keep out of the grasp of the New York police, by whom he was wanted on a charge of larceny involving more than $1,000,000 in connection with the exploitation of the Arizona Mining Company and the Lone Mining Company, arrived at Police Headquarters, New York, Oct. 23, having been arrested in Canada. There are five indictments against Flower, found in 1903. The complainant in one case, Isabella Gray Taylor, will appear against him. This indictment charges Flower with the larceny of $500 from Mrs. Taylor by selling her worthless stock in the Arizona Eastern and Montana Smelting, Ore Purchasing and Development Company.

Eleven workmen, employed on a new intake crib nearly a mile in Lake Michigan, were rescued from death, at Milwaukee, Wis., Oct. 24, by the lifesaving crew. The high waves which were flooding the crib made it impossible for a tug to approach close enough to take the men off. A member of the lifesaving crew, swam to the crib from a motor boat with a line and life belt, and one by one the men were saved. The rescue calls to mind the disaster on April 20, 1893, when twenty-one men lost their lives on a waterworks crib at Milwaukee during a storm.

The United States revenue cutter Bear arrived from Nome, Alaska, at Victoria, B. C., Oct. 26, bringing Capt. Robert A. Bartlett, master of the wrecked Stefansson exploring ship Karluk and eight Karluk survivors, who were taken off Wrangell Island. They were landed at Esquimalt and the Bear proceeded for Seattle with 48 officers and men rescued from the United States revenue cutter Tahoma, which was wrecked on a reef of the Alentian Islands. Of the 28 men who sailed from Port Clarence, Alaska, July 27, 1913, for the Arctic Ocean on the steam whaler Karluk, 11 perished. Stefansson with two companions is now adrift on the polar ice north of Alaska, having set out from Barter Point for Banks Land over the ice last March and having failed to reach his destination because of the early melting of the ice north of the mouth of the Mackenzie River.

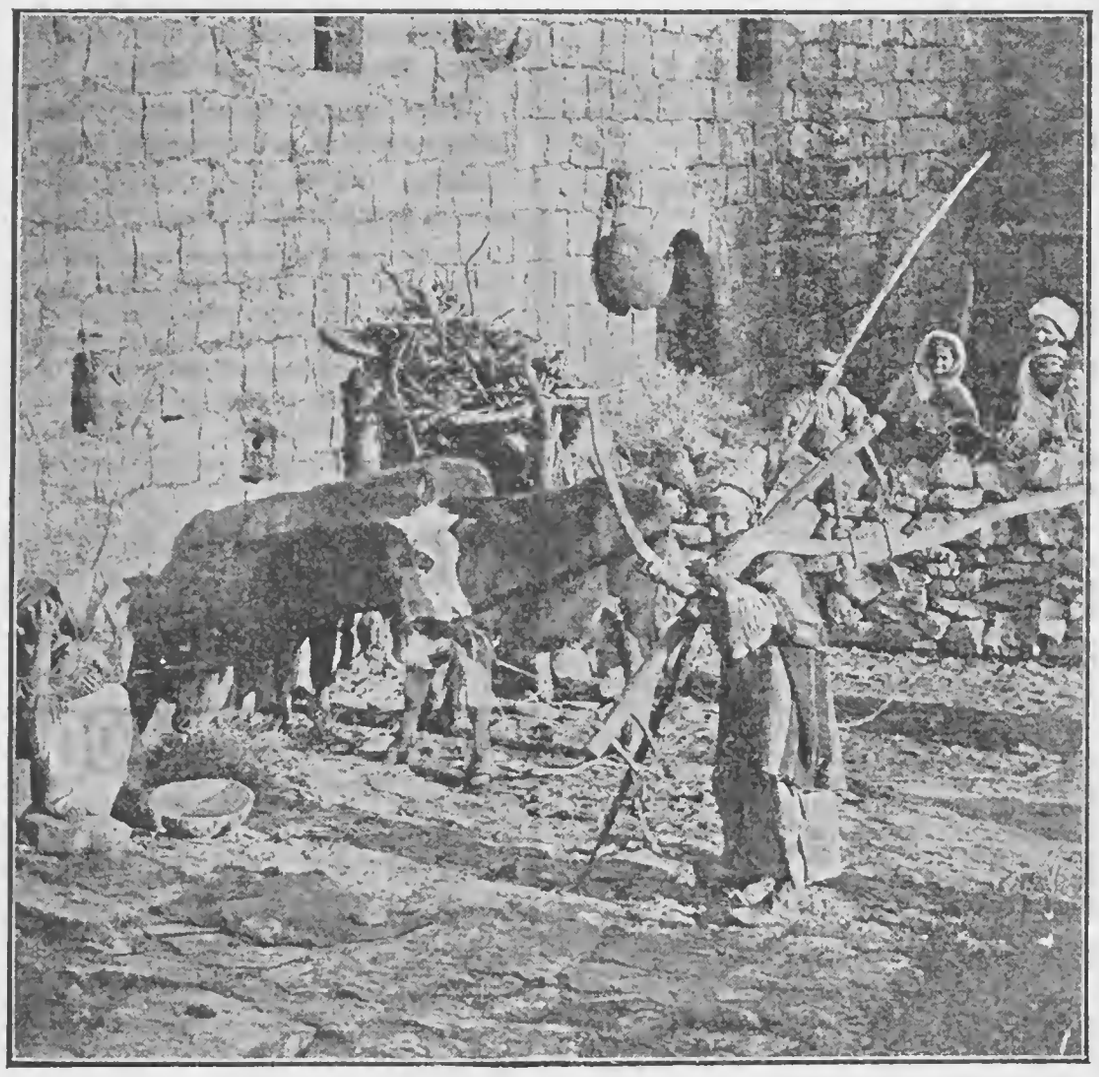
Two firemen were injured in New York, Oct. 27, at a blaze which for two hours defied the high pressure apparatus summoned by three alarms. The four upper floors of a six story factory building on the northwest corner of Lafayette and Great Jones Sts., were burned out. Acting Chief Martin estimated the damage at from $75,000 to $100,000. It took 1,500,000 gallons of water to subdue the fire.

Three men were killed and three injured, Oct. 26, by the collapse of a new theatre building at Youngstown, O.

Fifty men perished in the coal mine of the Franklin Coal and Coke Company near Royalton, Ill., Oct. 27, following a gas explosion, which caused a fire that could not be subdued.

A jury, at Cleveland, O., Oct. 27, awarded John Haas, 58 years old, of West Park, a verdict of $25,000 against Theodore Kundtz, cabinet maker, for the loss of his sight. Haas alleged that when operating a circular saw in the Kundtz plant he was hit in one eye by a piece of wood and afterward became blind. For the loss of his right eye a jury in Boston, Mass., the same day awarded Wilfred W. Davis of Brookline $15,000 damages from the Boston Elevated Railway. As Davis was waiting for a car a fuse blew out and particles of molten metal entered his eye.

THE EUROPEAN WAR.—The Swedish steamer Alice was blown up by a mine in the North Sea, Oct. 23; all on board were saved.....The British Admiralty reported, Oct. 23, that the German cruiser Karlsruhe had captured 13 British steamers in the Atlantic. These ships were mostly engaged in the South American trade.....Oct. 24 the British destroyer Badger rammed and sunk a German submarine off the coast of Holland.....The French steamer Amiral Ganteaume, from Calais to La Rochelle, with 2,600 refugees on board, struck a mine in the Channel, Oct. 26. Only about 30 lives were lost, owing to the presence of the cross-channel steamer Queen of Dover.....The freight steamer Manchester Commerce has been sunk by a mine off the west coast of England. This is the first mine disaster on the west coast.....The German cruiser Emden recently sunk the Japanese steamship Kamegasaki Maru, bound for Singapore. .....In the Battle of Flanders, October 22-29, along the seacoast, British and French light cruisers and monitors did effective work in bombarding the German positions. The fighting was terrific from Lille to the North Sea. The Germans crossed the Yser seven times. Prince Maurice of Battenberg, cousin of King George and brother of the Queen of Spain, is the first member of the British royal family killed. The Germans claim progress near Ypres and southwest of Lille, but this is denied by the Allies. The French appear to be advancing in the Woevre district.....Fierce fighting continues from the Baltic to the Carpathians, gains being claimed by both sides. Up to Oct. 29, the Russians had not captured Przemysl.....The South African rebels under Lieut. Col. Maritz have been defeated at Kakamas, their leader having fled, wounded, to German territory. Burghers are now arming under Christian De Wet in Orange Free State, and under Beyers in the Western Transvaal. Governor-General Botha announces that the very great majority of the citizens are loyal in every Province, and the Beyers commando was routed by Gen. Botha, Oct. 28.....Westminster Abbey has been insured for $750,000 against dam[illegible] on aircraft. It is reported that many other London churches have taken out similar insurance..... Nearly seven million in Belgium face famine unless they receive help from the outside at once. The American Minister to Belgium, Brand Whitlock, stated, Oct. 26, that less than two weeks' supply of food remained in the cities, while conditions in the country districts were worse. Though Germany has seized the food in some cities for her soldiers, she still disclaims responsibility for feeding the Belgians.....Insurance companies estimate the damage at Rheims at more than $200,000,000; more than 1,200 civilians were killed during the month's bombardment; 40,000 of the population remain, mostly living in cellars.



Copyright Underwood & Underwood, New York.

END OF THE DAY ON A PALESTINE FARM.

FARM AND GARDEN.—The New Jersey State Horticultural Society will hold its annual meeting in the agricultural building, State Experiment Station, New Brunswick, Dec. 8-10. A good exhibition is expected, and there will be the usual interesting speeches and discussions.

The first term of the two-year Winter course in agriculture given to farmers, their wives and daughters by the College of Agriculture of the University of Missouri began November 2 this year. For men this is a course in good farming; for women it is a course in better housekeeping. Anybody more than 16 years old may attend. The first term of the course ends December 18.

The Maryland Week Exhibition will be held at Baltimore November 16th to 21st. This Exhibition means a combination exhibit of various Maryland societies. The Maryland State Horticultural Society takes a leading part in the exhibit, and in connection with it the Maryland Crop Improvement Association, the State Dairymen's Association, and the State Bee-Keepers Association will combine and add to the exhibition. It will be one of the largest gatherings of farmers or country people ever known in Maryland. Great exhibits of farm products will be made, and valuable prizes will be offered. This in connection with addresses by prominent teachers and specialists will make a very strong meeting. A novelty in this connection will be an essay contest, open to boys or girls who regularly attend the Maryland public school. For example, $20 in gold will be offered for the best essay by a boy or young man on "Why the Maryland farmer's boy should remain on the farm." Twenty dollars will also be given for the best essay by a girl or young woman on "How social conditions in rural life in Maryland can be bettered by the daughters of Maryland farmers." The offering of these prizes for practical essays is a most excellent plan, and we believe that this part of the exhibition will be very interesting.

The nineteenth annual meeting of the American Association of Farm Institute Workers will be held at the Raleigh Hotel, Washington, D. C., Nov. 9-11. In addition to the reports of the standing committees dealing with the various problems of interest to institute lecturers, there will be a number of addresses of general interest.

At a recent meeting of the Eastern Live Stock Sanitary Association, Harry B. Winters, Albany, N. Y., was elected President; F. F. Walker, Boston, Mass., Vice-President; Dr. J. F. DeVine, Goshen, N. Y., Secretary and Treasurer. Dr. A. Joly, Waterville, Maine, Dr. Frank A. Ingram, Hartford, Conn., and Dr. H. P. Eves, Wilmington, Del., were elected members of the Executive Committee. The next meeting of the Association will be held at Wilmington, Del.

Information having reached him that the dangerous, infectious and contagious disease known as the foot and mouth disease exists in several counties of the States of Michigan and Indiana Calvin J. Huson, State Commissioner of Agriculture, has issued a notice and order forbidding the bringing of any horses, cattle, sheep, swine, goats or poultry into the State of New York from any of these counties. The order takes effect immediately and is for an indefinite period of time.

Twenty high school boys, specialists in agriculture, from California, who won prizes for getting the largest net results from given plots of ground, arrived in New York, Oct. 28, by special car. A transcontinental trip of 7,000 miles was the reward given to the twenty for their diligence and skill, through the efforts of the College of Agriculture of the University of California, with the coöperation of municipal chambers of commerce. Professors B. H. Crocheron and B. F. Morgan, of the agricultural extension of the University of California, are in charge of the party. They left California on October 15, and on their way East inspected twelve types of farms. They are going to see cotton in Georgia and sugar in Louisiana.

Goshen Farm Bureau was organized at Court House, Goshen, N. Y., Oct. 24. Forty-one paid in out of fair attendance. D. V. Farley, president; John Arfman, vice-president; C. B. Coleman, secretary; Howard Seeley, treasurer. Albert Manning, supervisor's nominee, executive committee, also C. W. Harlow, Pomona Grange nominee.

The case of the National Society of Record Associations before the Interstate Commerce Commission has been set for hearing on November 20th at Chicago. In this case the breeders of purebred live stock in the United States, through their national organization, are attacking the present requirements of railroads relative to less than carload live stock shipments. The breeders will attempt to secure relief from the present excessive rates imposed on shipments of live stock under declared values in excess of the limited liability. The breeders also ask to have the minimum weight reduced in official classification territory where stallions are now shipped at the weight of 7,000 pounds and horses and cattle at 5,000 pounds. The present limitation of liability in case of loss is claimed to be unreasonably low, and the Commission is asked to order an increase of this liability.

THE WAR TAX.—The new war tax revenue law, affecting nearly all lines of business, became operative Oct. 23, except where later dates are specifically provided. Among the articles on which it went into immediate operation were the taxes on fermented liquors, including a graded scale of taxes on domestic and imported stilled wines, champagnes, liqueurs, cordials and sparkling and carbonated wines. Pending the preparation of the new stamps for wines, liqueurs, etc., the internal revenue collectors were authorized to imprint on the old stamps the new rate of tax and to permit their use by distillers. On November 1 the new war taxes to be imposed on bankers, brokers, proprietors of theatres and circuses, tobacco dealers and cigar and cigarette manufacturers went into effect, while one month later, on December 1, 1914, the new taxes on bonds, debentures, stock certificates, selling agreements and contracts, promissory notes, express and freight bills of lading, manifests and other shipping and sales memoranda, policies of insurance, or bond of nature of indemnity for loss, entry or withdrawal of merchandise from customs houses, telegraph and telephone messages, etc., become effective. It is further to be noted that the system of taxes provided for in the new law are not to be levied after December 31, 1915. Before that time, however, the occasion may arise for Congress to extend its period of effectiveness, in some part at least. Bankers on each $1,000 of capital, surplus and undivided profits shall pay $1. This tax applies to any person, firm or company and every incorporated or other bank "having a place of business where credits are opened by the deposit or collection of money or currency, subject to be paid or remitted upon draft, check or order, or where money is advanced or loaned on stocks, bonds, bullion, etc.," but savings banks having no capital stock, including postal savings banks, whose business is confined to receiving deposits and loaning or investing the same for the benefit of its depositors, and which does no other business of banking, are exempted from the tax. The tax on beer is fixed at $1.50 a barrel, or 50 cents above the tax as it formerly stood. The law provides for the punishment of those who violate or seek to evade any of its provisions by declaring that such acts shall be deemed misdemeanors, and the offenders, upon conviction, shall be subject to fines ranging from $10 to $300 for each offense, and also provides in one or two instances for fines as high as $1,000 and terms of imprisonment for from six months to five years, at the discretion of the court. The heaviest penalty is incurred for counterfeiting or conspiring to counterfeit or alter any of the adhesive stamps which will shortly be issued under the law.

CROP REPORTS.

Oct. 20. The markets here are very narrow. We can get only 32 cents per can for our milk now, 8¼ quarts. In the Summer it was 28 to 30 per can. For Manchester, 10 miles away, it was selling at 8 to 10 cents per quart. Cattle do not command a big price. Good cows can be bought for $40 to $60 each. It all depends upon whether a farmer has hay enough to keep the cows through the Winter. Hay sells at $20 to $23 per ton. We have to pay $1.25 per bag for oats, 32 pounds to the bushel, which measures 1½ bushel per bag. We can only get 36 for butter, and 38 for eggs. Apples only bring about $1.50 to $1.75 per barrel for hand-picked Baldwins. Potatoes bring now about 55 cents per bushel. Live poultry 15 to17. Hay, good English $20 to $23; cows $40 to $65; milk, per can 8¼ quarts, 26 to 34; butter, 32 to 38; eggs, A1, 20 to 40; apples this year, $1.50 to $2 per barrel. We do not sell any gardening crops to mention in this locality. W. F. L.

Candia, N. H.

Oct. 23. Turnips 50 cents per bushel; potatoes, 85; apples, per barrel, $1.50 to $2 for good Winter apples. Cabbage $6 per hundred; beets 50 cents per bushel; hogs, $11 per cwt.; eggs 50.

Arlington Heights, Mass. C. B. G.

Comparison of Stable Manure, Bedding and Hay.

WHICH would be the cheapest way to improve the fertility of my farm; to buy Boston stable manure at $7 per cord, or buy ordinary fresh water swamp grass at $12 per ton? This is to be used as bedding, and then put on to the land (not taking into consideration the value of the excrements from the cows which will be added to the grass when used as bedding)? A third plan is to buy hay at $15 per ton, feed it to stock and spread the resulting manure on the land. In other words, what is the comparative fertilizing value of Boston stable manure, bedding and hay? F. K.
Connecticut.

The following table shows what you would import as plant food in these substances:

Pounds In One Ton.

	Nitrogen	Phos. acid	Potash
Stable manure	10	6	12
Swamp grass.	20	4	17
Hay	26	6	30

This is mixed hay—not pure Timothy. The manure is figured by the ton and not by the "cord"—the latter varying considerably in weight. We do not know whether F. K. has a barn and is already stocked with cattle.

Tanners' Refuse for Fertilizer.

WHAT is the value, for fertilizing purposes, of refuse from a leather manufacturing establishment? Several tons of this can be secured at an expense for hauling and handling of about $2 a ton. The proprietor of the factory describes the refuse as follows: In the tanning of hides the raw hide is placed in a vat in which is a large quantity of lime, together with chemicals. After standing several days the lime and chemical eats off the hair and all of the fat and grease. The hair, fat, grease and lime settle to the bottom of the vat, and are later thrown on a pile in the yard. Is there any fertilizing value to this refuse, and how am I to determine the same? J. E. W.
New York.

These things, among others, are discussed in a little pamphlet on "Plant Food Wastes," which we distribute. The following is printed under "Tanning Wastes":

"Some of our readers are located near tanneries where wastes are thrown away or held at a low value. Here are average analyses of these wastes:

POUNDS IN ONE TON.

	Nitrogen.	Potash.	Phos. acid.	Lime.
Ashes—spent tan bark....	..	36	26	600
Ashes—tan bark	..	30	.12	1,000
Tannery lime waste.....	13	..	..	1,100
Tannery vat refuse	12	6	2	32
Tannery filter bed refuse.	18	2	16	400

Here we strike the first thing to remember. Whenever a substance is burned to ashes the nitrogen is driven away in the burning. There cannot be any nitrogen in any waste that is completely burned. Thus the ashes of tan-bark, like any other ashes, are useful for the lime, potash and phosphoric acid they contain. The unburned wastes from the tannery contain nitrogen with more or less of the other elements. In figuring values on such wastes you may estimate that when you buy fertilizers a pound of nitrogen will average you about 18 cents, while potash and phosphoric acid will cost about five cents. The price of lime varies too much to give any general price. Another product now being used is the refuse or sludge from glue factories. It will frequently contain 30 pounds of nitrogen and 600 pounds of lime to the ton."

Such wastes may be spread on the ground during the Fall and left to "weather" during the Winter, or composted with the manure before using.

Recent Experiment Station Bulletins.

FROM the New York Agricultural Experiment Station at Geneva, N. Y.:

Bulletin No. 387: The Pear Psylla and Its Control; a brief review of the more complete bulletin on this subject and containing a description of the life history of the pear psylla with methods for its control.

Bulletin No. 388: Tree Crickets of Garden and Orchard; another condensation of a larger bulletin upon the same subject containing an interesting description and fine illustrations of our common tree crickets. The more complete bulletins mentioned above bear the same numbers as those given for the popular edition described.

Bulletin No. 383: How Sod Affected an Apple Orchard; a popular and condensed review of the larger bulletin by the same number giving a comparison of tillage and sod mulch in apple orchards.

Bulletins Nos. 373 and 380: A New Method of Determining Milk Quality; again a popular and condensed review of larger bulletins describing a comparison of microscopical and plate methods of counting bacteria in milk.

Bulletin No. 382: Control of Cabbage Maggot on Early Cabbage; another popular edition of the larger bulletin upon the same subject.

From the Agricultural Eperiment Station at Madison, Wis.:

Bulletin No. 202: How to Improve Our Heavy Clay Soils; a bulletin of interest and value to all farmers on this type of soil.

Bulletin No. 241: Some Improved Dairy Tests and Methods; of chief interest to ice cream manufacturers and creamery operators.

Bulletin No. 239: Three Creamery Methods for Making Buttermilk Cheese; for cheese manufacturers.

Bulletin No. 204: Ways of Improving Our Sandy Soils; like the bulletin upon the management of clay soils of interest to all farmers owning this type of soil.

Bulletin No. 205: The Improvement of Marsh Soils; those wishing to utilize this type of soil will find this bulletin of value

From the Massachusetts Agricultural Experiment Station at Amherst, Mass.:

Bulletin No. 155: New Fertilizer Materials and By-products; this bulletin gives the fertilizer value of a number of miscellaneous materials available in limited quantities to farmers in the vicinity of the establishment where they are produced. Cocoanut meal as a dairy feed is also discussed in this bulletin.

Summer Pruning the Peach is the title of Bulletin No. 108 from the Tennessee Experiment Station at Knoxville Tenn.; of interest to peach growers.

Wild Garlic and Its Eradication is treated in Bulletin No. 176 from Purdue University Experiment Station at Lafayette, Ind.; it is complete and copiously illustrated. M. B. D.

FARM NEWS.

THE Wisconsin Cranberry Growers' Association distributed at the Minnesota State Fair 10,000 copies of "How to Cook Wisconsin Cranberries." They have learned it pays to advertise. Their annual crop is valued at $450,000, and the State stands third in the production of berries.

If the corn is in an open crib better stack some fodder around the north and west sides to keep the wind from driving snow in on the corn. Keep the crib well covered, for corn inside will suffer injury, if not protected in this way.

Ohio cranberry growers are enthusiastic over the color and quality of the product from the bogs around Toledo. It is said they are superior to Cape Cod berries, and are selling in the Toledo market at $4 a barrel. The Ohio crop is large, as is the crop elsewhere.

Many farmers were dissatisfied with sugar beet returns, and turned their acreage in other crops. This is particularly true in Ohio and Michigan. Regarding the war, "It's an ill wind that blows no man any good." The sugar beet trade has been boomed by the war, and up to the time of its declaration the possibility of profit to manufacturers as well as farmers was considered small.

The value of manure is increased $1 a ton, when applied by a manure spreader is the opinion of an Indiana writer. He says, "We must apply manure more carefully to the land to get the best results from it, and the old way of hauling and piling is a waste of labor." Manure should be hauled out and spread on the ground directly, or it should be conserved in a pit, the juices saved, and then hauled and spread at proper time.

The Wisconsin Experiment Station advises Fall plowing for Alfalfa seed bed, particularly on the loam and light soils in Wisconsin. If the ground is plowed just before seeding it leaves the ground too loose for good germination. By Fall plowing the seed bed is properly firmed, and is in best condition. Fall plowing is beneficial, as it gives opportunity to combat weeds by disking until time for seeding the Alfalfa. Farmers may also put lime on the plowed ground during the Winter.

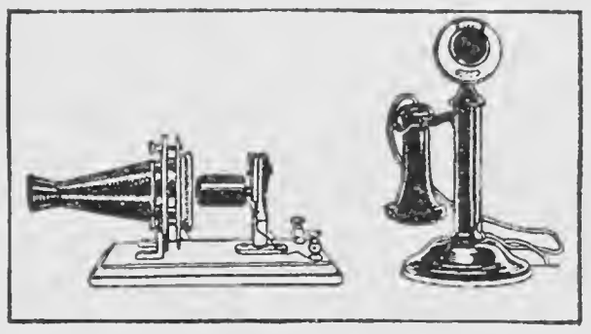
There will be no shortage of kraut either at the White House or the country over, is the opinion of manufacturers. President Wilson will receive a 60-gallon cask from Sandusky as a gift this year, from a concern which was similarly mindful of President Taft. Manufacturers report that throughout northern Ohio, Western Pennsylvania, New York, Indiana, southern Michigan, central Minnesota and Wisconsin the cabbage crop this year is very good. It is predicted there will be no soaring of prices, although the German product will be absent from the American market.

"O, DOCTOR, I have sent for you, certainly; still, I must confess that I have not the slightest faith in modern medical science." "Well," said the doctor, "that doesn't matter in the least. You see, a mule has no faith in the veterinary surgeon, and yet he cures him all the same." —Sacred Heart Review.

THE man in the automobile duster and goggles confronted an artist painting a picture by the roadside. "Say," said the motorist, "I'll give you $5 for that picture just as it is. Don't put another stroke on it." "I am really very flattered by your offer," replied the artist, "but why not wait until the picture is finished?" "Can't. I need the canvas to mend a busted tire with."—New York World.

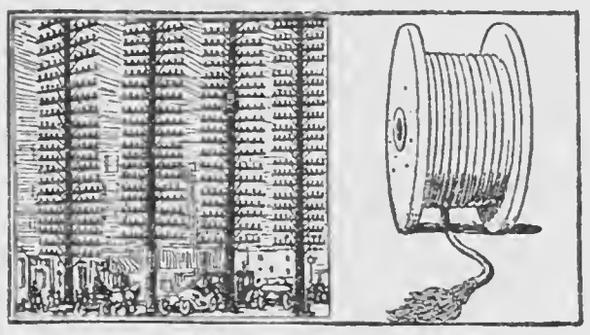
How the Public Profits By Telephone Improvements

Here is a big fact in the telephone progress of this country:



Original Bell Telephone 1876 — Standard Bell Telephone To-day

Early Telephone Exchange — Typical Present-day Exchange



If City Wires Were Carried Overhead — 800 in Underground Cable

Hand in hand with inventions and developments which have improved the service many fold have come operating economies that have greatly cut its cost.

To appreciate these betterments and their resulting economies, consider a few examples:

Your present telephone instrument had seventy-two ancestors; it is better and cheaper than any of them.

Time was when a switchboard required a room full of boys to handle the calls of a few hundred subscribers. Today, two or three girls will serve a greater number without confusion and very much more promptly.

A three-inch underground cable now carries as many as eight hundred wires. If strung in the old way, these would require four sets of poles, each with twenty cross arms—a congestion utterly prohibitive in city streets.

These are some of the familiar improvements. They have saved tens of millions of dollars.

But those which have had the most radical effect, resulting in the largest economies and putting the telephone within everyone's reach, are too technical to describe here. And their value can no more be estimated than can the value of the invention of the automobile.

This progress in economy, as well as in service, has given the United States the Bell System with about ten times as many telephones, proportionate to the population, as in all Europe.

The Flame of Acetylene Light is Small and the Burner Peculiar

You have probably noticed that a Pilot Country Home Acetylene burner is shaped like the letter "Y."

And that the little gas openings in the arms of the burner are only pin hole size. So small they let out only half of a cubic foot of Acetylene in an hour.

You might leave one of these Acetylene burners open by accident all day—and even then there wouldn't be gas enough in the air of the room to enable you to set fire to it if you tried.

As a matter of fact, you would have to leave the burner open fully three days and nights in a room twelve by fourteen, with windows and doors closed tight, before there would be any fire or explosion whatever.

And the chance of your leaving a burner open that long is not worth considering. The pungent odor of the escaping gas would be certain to attract attention in a few seconds.

Insurance reports say that in a list of 10,000 recent fires and accidents caused by illuminants, 9990 were charged to the misuse and abuse of electricity, kerosene, gasoline and city gas and only ten to the misuse and abuse of Acetylene.

That's why the engineers of the National Insurance Board have endorsed Acetylene. They say it's safer than the oil illuminants it is rapidly displacing.

You should use home made Acetylene yourself to light your house and barns and to cook your meals.

All the facts and figures are in our illustrated catalogue which we send on request. Address

Hope Farm Notes

I HAVE six acres of Cowhorn turnips sown in a seven-year-old Bartlett pear orchard. These turnips were sown in July, and now the tops cover the ground. When would it be advisable to plow them under, this Fall or next Spring? C. M. R.

Here is a case where what we may call the social side of agriculture must be considered. How near is this field to the dwelling house? If nearby and to windward, I would plow the turnips under this Fall. With all their fine qualities as humus and potash accumulators, these turnips during a mild Winter or a thaw will send out a fearful odor. The turnip is strong in sulphur, and you pay the penalty when the roots decay. If the field is out of range I would leave it till Spring, as you will get more good out of it then, especially if rye was seeded with the turnips. Such a field will be a mighty offense to a delicate nose in a Winter thaw or in late Spring if it is near the dwelling house. One good way to handle such a field is to turn in a flock of sheep at this time and let them gnaw the turnips down. You are fortunate in getting such a growth. Most of us have a poor stand as a result of the drought.

TENDER HANDLING.—There is no question about the wisdom of handling all perishable products tenderly. You cannot expect to handle eggs with a scoop shovel or apples with a pitchfork, or to throw potatoes around as you would field stones—not if you expect to make anything out of them. A very slight bruise will start decay in tender flesh and then, with ordinary storage, there is rapid loss. We all realize that eggs must be handled gently. The loss in a broken egg is quickly evident. It takes longer to realize that apples or roots or vegetables cannot be used as baseballs, but such is the fact, and this gentle handling is one of the first principles of fruit growing. It is one of the first lessons in picking which I try to teach the children.

APPLES.—We finished picking the last week in October. The actual crop ran at least 50 barrels over our estimate on the trees, and there are still over 100 barrels of drops and culls to pick up. We cannot handle them this year, so they are sold on the ground—the buyer picking them up, paying so much a bushel. He will sort and sell part as pie fruit and the rest for vinegar. We could get more out of it if we had the time to pick up, but with our crop to rush off before December 1 we have little time to handle drops. Our fruit will mostly go into the local market. We put the following advertisement into the paper published in our county town:

BERGEN COUNTY APPLES—Our fruit is sound and fine this year and will be sold direct from the orchard in scant half barrel baskets. No. 1 means full size, hand picked and sound; No. 2 are of smaller size, otherwise the same. Pie fruit is of medium size, slightly bruised, but suitable for cooking. Free delivery.

I leave out price and address as I do not think it fair to compete with other apple growers. I merely print this to show how we do it. I have letters from people who live all the way from New Hampshire to Indiana asking for our apples. Now I know that there are apples in New Hampshire better than ours, and I do not want to interfere with sales by local growers. We can handle our fruit without great trouble, and it will be far better for all to buy direct from nearby growers if such a thing is possible.

BUSINESS.—This advertising pays us well. Within a few hours after it first appeared a woman called up on the 'phone and ordered two barrels. Calls for 15 baskets or more in a single mail are not infrequent. I have been astonished, in view of our own results, that more farmers do not make use of this local advertising. I think it far better to go into the local town or city rather than to try some faraway field. If you do try it be as liberal in your dealings as possible. Give them heaped-up measure and the finest quality you have. I am trying to bring my boys up to understand that it is just as dishonest to put inferior fruit in the package as it would be knowingly to pass counterfeit money. Follow this plan, and every customer you pick up will come back for more of your goods and also go out and drum up trade for you. You will be surprised to see how many there are in your town who appreciate good produce. One boarding-house keeper has ordered 20 barrels of apples, and would take 100 barrels of potatoes. The Housewives' League members are ordering 60 barrels of apples, and would take dressed poultry, small carcasses of pork and other food. Here are opportunities for small organizations of farmers to meet these household organizations in direct trade. Two things are necessary, however. We must be fair. We must learn to make a standard for our goods and live right up to it, and we must make a fair price. I consider it folly for the farmer to try to hold up his direct customers to the retail prices charged by the stores. We must offer a fair inducement if we ever expect to change the present system of doing business.

THE SPIRIT OF AGE.—On October 20 the Hope Farm man attended a banquet given by the Business Men's Association of Windsor, Conn. There are many thousands of towns in this country all claimed to be "best." I think Windsor has about the best motto I have seen—"In years the oldest town in the State—in spirit the youngest." Just stop and run that over until you get it all and see how much it means. It means so much that I cannot possibly add to it by any comment. This old town lies in the rich Connecticut Valley—a region of tobacco farming—perhaps the most profitable of any in the country. I should judge that Windsor remained satisfied and stationary for a good many years. Now a few eager spirits have organized an association, and they are pushing the old town into new and vigorous life. There were nearly 300 people at this banquet—about half of them sturdy and substantial farmers—the rest business men. The women got up the supper, and it was served informally. I presume every section is noted for some kind of food which is cooked in superior fashion. There is no spot on earth—at least I have never found it—where finer pumpkin and apple pies are to be found than in the upper Connecticut Valley. They had them on tap that night to top off a dinner which would be served by a prosperous farmer to entertain company. There was a fine program of music and recitations—no foolish vaudeville performances, and no smoking. They had invited the ladies, and the wives and sweethearts and sisters and daughters were there as fine and rosy as apples. Here was a section of apples and peaches and tobacco. In compliment to the ladies the men cut out tobacco, while the ladies came as peaches and turned the apples into those famous pies. All agreed that this club and its meetings were doing great things for the town by bringing people together and making them acquainted. They also agreed that such a club could not live long unless a few live and unselfish members were willing to give time and money to the job. That is the secret of all such organizations. There ought to be thousands of just such clubs in country towns. They could do wonderful good just now in organizing for selling products, or for inducing people to establish manufacturing plants, or develop new enterprises. What about your town? Is it old in spirit as well as in age? What is the reason *you* cannot put new spirit into it—as they have done at Windsor?

SELF DENIAL.—This horrible European War will result in frightful suffering during the coming Winter. Many of the Belgians are without homes and probably 1,000,000 soldiers have been killed or seriously wounded. Vast as are the resources of the great fighting nations it will be impossible to care for all the helpless ones. This great nation cannot take sides in this hideous quarrel, but we can help the unfortunate through the Red Cross and other commissions. All over the country this need of help and the privilege of helping is coming home to our young people as few things have done for years. As an instance, my daughter at a woman's college, tells us how the junior class is exercised over the question of celebrating their annual "Prom." This is the big social event of the year—the one great dance and general "good time" which the students are permitted during their four year's course. It is an elaborate affair and costs considerable money. Now the question has come up to those girls—"Shall we hold this expensive 'Prom' or have some simple affair and give the money to the Red Cross?" It is a hard question for those young women. I would not influence one of them one way or the other, for character is made—not by what others tell us, but what we reason out for ourselves. It is the question, however, which will come to thousands of our young people during the remainder of this awful war. H. W. C.

Panning Gold Dust.

I HAVE small deposits of gold in the sand of a stream. Can you tell me where I can find instruction about using a pan for separating out the gold? J. P. R.

Panning is a very simple process if one has seen another do it, but it is rather difficult to become efficient with a gold pan from written directions. The best directions that I know of are contained in the first five pages of a little hand-book entitled "Useful Minerals and Rare Ores," by Alexander McLeod, published by John Wiley & Sons, New York. In regard to machinery for extracting the gold J. P. R. may take up the subject with the *Engineering and Mining Journal* of New York, as it will be able to furnish him the names of reliable manufacturers of such machinery. G. H. A.

Massachusetts Garage Law.

WHAT is the law in Massachusetts in regard to fireproof garages? How many feet must they be from a building, and does the law apply to country places the same as in thickly settled places. F. D.

I suppose the inquirer means a private garage for family use only, which would probably come under the fourth or fifth class, the former for housing one car, the latter for housing not more than two cars. These may be conducted without a license or permit, but are subject to the laws and regulations of Massachusetts in regard to operation and maintenance. Such a building must be made with fireproof floor, and shall be at least 20 feet distant from any other building which is not over three stories in height; not less than 50 feet distant from building over three stories in height; must be at least 100 feet from any building not owned or controlled by owner of garage. All other garage come under first, second and third class, and must be fireproof in all ways. Artificial heating must be by steam or hot water. No volatile inflammable liquid shall be put into or taken out of a motor vehicle near open lights; all lights on vehicle must be out and engine stopped when so doing. Above liquid should be stored in ground outside garage unless permission to store underground inside is obtained from proper officials. The laws cover both city and country garages in all cases. A. E. P.

Order Sunlight Double Glass Sash—NOW

The J. Weller Co., Cincinnati, O., the famous canners, ordered first in 1911. In 1912 they wrote: "We will buy more this winter." They did. Also more in 1913 and 1914.

No More Mats and Shutters

Extra thick, of cypress, everlasting, double-glazed with an air space that admits the sun, but not the cold, this sash has rendered the old style single layer sash obsolete. It eliminates mats and shutters cutting the cost one-half and doubling the efficiency in the garden.

Get Our Catalogue

Our free catalogue explains everything in detail both about the sash and the Sunlight Greenhouse on which the sash are also used. It is inexpensive, attractive and a highly profitable addition to any garden.

If you wish it, enclose four cents in stamps for a copy of Prof Massey's booklet on the use of cold frames, hotbeds and small greenhouses.

SUNLIGHT DOUBLE GLASS SASH CO.
924 E. Broadway :: Louisville, Ky.

RHODES DOUBLE CUT PRUNING SHEAR

Cuts from both sides of limb and does not bruise the bark. We pay Express charges on all orders. Write for circular and prices.

RHODES MFG. CO.
529 So. Division Ave., GRAND RAPIDS, MICH.

Make the Engine Grind the Meat

A Lancaster Pulley will make the hand grinder as good as any power machine. Made in two sizes:
12 inches by 2½ inches face, $1.50
15 inches by 2½ inches face, $2.00
Parcel post paid. Made for Enterprise cutters, Nos. 12, 22 and 32; also Universal Nos. 344 and 345—give us the make and number, we'll send the right pulley by return mail.
LANCASTER PULLEY CO., 401 F Chestnut St., Lancaster, Pa.
Farm Machinery and Water Systems

The New GREENWOOD LIME and FERTILIZER DISTRIBUTER

TOP FEED—NO RUSTING—NO CLOGGING
Accurate indicator for 100 to 3,500 lbs. per acre, whether material be wet, dry, sticky, lumpy, heavy or light. Write for booklet R 10
GREENWOOD MFG. CO., Lawrence, Mass.

WELL DRILLING MACHINES

Over 70 sizes and styles, for drilling either deep or shallow wells in any kind of soil or rock. Mounted on wheels or on sills. With engines or horse powers. Strong, simple and durable. Any mechanic can operate them easily. Send for catalog.
WILLIAMS BROS., Ithaca, N. Y.

NOTES FROM A MARYLAND GARDEN.

A DRY SEASON.—The driest Summer I have ever known has closed in the midst of arid conditions. Spring was very dry, and no rain till the first of July, when we had good rains and hoped that the drought was over. But the rains stopped till August, and we had good ones the early part of that month, and then another stoppage, and here is the last of September and still no rain, and a temperature of 95 the last week in this month. The great tomato canning crop is a very important one here, for every farmer plants a field in tomatoes for some one of the fifty or more canning ho ses in this county. The crop was late and the drought has cut it short, and many claim that they will not have more than half a crop.

DROUGHT DAMAGE.—In my garden the drought has made very serious damage, and many things have been affected in an unusual manner. I am now lifting Gladiolus corms. The majority of them, instead of making the one or two good-sized corms on top of the old one, have broken up into half a dozen or more little corms less than an inch in diameter. These little corms will all probably bloom, but are wholly unsalable, for people who buy bulbs of any sort always want large ones. The one exception has been the America. Why these have developed to the normal size in the same plot where others run small is hard to understand. But even these have failed to make the mass of little corms usually found between the new and the old corm, and America usually makes a great many of these. My eggplants were heavily mulched with stable manure, which has had some effect in retaining moisture, and the plants have made a wonderful growth, but have produced fewer fruits than I have ever known on the usually prolific eggplant. Last year I had a trellis 50 feet long covered with moonflowers, and they seeded finely, so that I was able to supply quite a lot of seed to the Northern trade. This year the moonflowers have grown and bloomed finely, but never a seedpod formed. One would suppose that the arid season would be favorable to the setting of seed. But probably the bees have been driven to the swamps and low grounds, and a lack of insects may have had something to do with the scant seed-setting.

VEGETABLES.—Spinach seed sown early in August has almost entirely failed to germinate in the dry soil, and I have sown a lot in a plot where I can reach with the hose and keep it watered daily, and am getting some started which will probably get large enough to winter, but we shall be short of Fall spinach. But through all the dry weather we have had one resource in the chard. This has been our dependence for boiled greens, and it takes the place of spinach very well. We keep the big outer leaves pulled off to encourage the production of the inner and more tender leaves. Leeks are uncommonly small, but we may have some rain yet, and these hardy things will grow till Christmas and may still give us leeks this Winter.

LATE SOWING.—The Chinese Rose-colored radish seed has just been sown. These we mulch heavily with manure in Winter and generally keep them in good condition for use. The lettuce frames will now be the chief thing to be looking after. Plants for the Christmas crop are now nearly large enough to prick out into flats to get stout for setting in the frames, and I shall still sow seed inside to plant for the succession Winter and early Spring crop. Cabbage seed has not germinated yet, and it looks as though I shall have to depend on plants from the frames for planting in Spring, and leave out the Fall setting entirely.

W. F. MASSEY.

Brassington Cherry.

THE Brashington cherry, about which J. F. S. inquires on page 1213, is probably the Brassington, a comparatively new sour cherry of considerable merit, originating, I believe, in Michigan. As grown on the Experiment Station grounds the trees are moderately vigorous, very erect growing. The fruit is larger and darker than Early Richmond, and is of excellent quality when fully ripe. The characteristics of tree and fruit leads to the impression that it belongs to the Duke class. PAUL THAYER.

Ohio Experiment Station.

Perfume from Scented Geranium.

I HAVE been informed that perfume can be made from Sweet scented geranium leaves. Could you tell me how this can be done? H. C.

Long Island.

The essential oil of scented geranium is used by perfumers, and is also an adulterant of attar of roses. The process of extracting flower oils, which is followed in extracting essential oil from leaves also, was described quite fully in THE R. N.-Y., issue of October 11, 1913, page 1105. The appliances called for were a steam can, herb can, and condenser, with an overflow for waste water and a receptacle for the finished product. For the steam can, a clean five-gallon oil can is suggested; a pipe of lead or pure tin from this enters the herb can at the top reaching down, inside, to the bottom. Another pipe soldered into the top of the herb can leads to the condenser. The top of the herb can must screw or clamp tight, so that there is no leakage of steam. There are various types of condensers; the article we printed last year warned against the glass coil, which is cheap, but unsatisfactory unless the operator knows how to use it. The old form of a metal coil in a pail or tub of water may be used, but a glass condenser with rubber tube may be bought from a chemical supply house, and this is preferable. The Allihn type is advised; the straight Liebig type permits the steam to blow through.

The steam can, with a vertical tube at the top to act as safety-valve and give warning when the water is low, should be nearly filled with water to start, and the herb can, with the steam tube reaching below the false bottom, should be packed with the flowers or herbs. The flow of water in condenser may be from one pail to another. Of course, there is a separate flask or other vessel to receive the distillate. When the charge is exhausted the oily drops or milky flow cease, and only water comes out.

Anyone wishing to operate such a still should register it with the Internal Revenue Office for his district, to avoid any risk of injurious suspicion. The Bureau of Plant Industry, U. S. Department of Agriculture, Washington, can supply practical information on the distilling of perfumes, having literature available on the subject, and it would be well to secure this matter from them.

California Poison Oak.

IS the poison oak of California and the Pacific Coast the same as the poison ivy of the Atlantic States, and will it respond to the same preventive and curative treatment as the other? The poison oak here, on poor thin soil is a small bush; in rich deep soil it is a much larger and thicker bush; when it grows next to a large oak in good soil it becomes a vigorous climber. A. L. B.

Oakland, Cal.

The poison oak of California, also called poison ivy, yeara and poison sumach is Rhus diversiloba, and is closely related to Rhus radicans, the poison ivy of the East. The same treatment and preventives apply to this plant as to the poison ivy.

DURING the past year we have had a great many questions about the possibilities of nut culture in New England. It is very evident that our readers in that section are much interested in this nut proposition. All who are so interested should read the document on nut culture by William C. Deming, which is issued by the State Board of Agriculture at Boston. This document is known as "Nut Culture for Massachusetts," and is Circular No. 26, issued in June, 1914. Dr. Deming gives a thorough study of the matter as applied to New England. Among other things, he predicts that the time is coming when the future American will grow nut trees, and between them beans and Alfalfa; he will keep some chickens and a cow and be forever independent of the butcher, although he may have to send to the grocer now and then for a codfish from which to make codfish balls. When this happy time comes we shall all have to get nut trees. The pamphlet is an excellent one, and we commend it to our readers who are interested in nuts.

"What's the matter with Willie?" "He's turned anarchist." "Anarchist! Dear, dear! What's turned him?" "He says he can't support any government that wilfully sends ships to bring home stranded school-teachers." — Cleveland Plain Dealer.

We Save You $8

Fall Suits and Overcoats

$10 to $22

Money Refunded If Not Satisfied

Of course you want that new Fall Suit or Overcoat of yours to be stylish. Yet the more dollars you can save on such a garment the better you will like it. Let's get together.

Send for our Men's Fall Style Book and 40 samples of cloth patterns. You select the style of cut and cloth sample which you like best. Write your measurements in order-blank which we furnish. You can't go wrong. You can't lose on the Glen Rock plan.

Every garment is guaranteed not only to fit perfectly, but to *keep* its perfect shape permanently. Glen Rock garments are noted for the excellence of cloth, trimmings, cutting and tailoring. Signed guarantee attached to every made-to-order garment. The first step to save $8.00 is to Send Today for Style Book and 40 Cloth Samples. IT'S FREE.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates, 75 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. We use every possible precaution and admit the advertising of reliable houses only. But to make doubly sure, we will make good any loss to paid subscribers sustained by trusting any deliberate swindler, irresponsible advertisers or misleading advertisements in our columns, and any such swindler will be publicly exposed. We are also often called upon to adjust differences or mistakes between our subscribers and honest, responsible houses, whether advertisers or not. We willingly use our good offices to this end, but such cases should not be confused with dishonest transactions. We protect subscribers against rogues, but we will not be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and to identify it, you should mention THE RURAL NEW-YORKER when writing the advertiser.

YOU never saw a horse race that ended with a closer finish than the egg-laying contest between the English Wyandottes and the American Leghorns. At one time the Leghorns were more than 50 eggs ahead, and most observers thought it was "all over." Egg by egg the Wyandottes crawled up and, as we write, it looks as if they would scratch out at the finish. We salute the winners no matter where they hail from. Barron and Lincoln are both good winners and equally good losers. "Hands across the sea!" and good luck to both of these good sports.

*

SOME of the most useful agricultural exhibitions in the country are the small Grange fairs. While less pretentious than the county fairs, they are more useful because they represent the plain farmers and give all a fair chance. They are coöperative too. Many of the prizes are offered by business men in town, so that both producers and consumers are interested. The fairs are held late enough in the season to give farmers a chance to exhibit mature fruits, grain and vegetables. The idea of these little local fairs is fine, and they ought to be encouraged everywhere.

*

THE Housewives' League is a very useful organization. In many places it has done excellent work in organizing buying and in fixing a standard of quality. Its advocates must remember one thing, however. There is a fair price for farm produce, below which it should not go. The Housewives' League should not be so eager to cut prices as to demand that the farmer sells for less than his produce costs. The fierce demands for "bargains" in dress goods resulted in taking most of the home manufacturing away from farmers and their families and driving it to poorly-paid foreign labor—crowded into the cities. This constant demand for food at prices below the cost of production will result in economic disaster to farmers. Such organizations as the Housewives' League ought to work with country women in maintaining fair prices.

*

IN a recent issue of THE R. N.-Y. several stories appeared concerning the apple crop, with apparently no available market. I have looked through the paper carefully and as a result found no advertisements where anyone wishes to sell apples. The wholesalers are asking $1.75 a barrel for apples here, but only retailers can buy them. They are receiving 25 cents a peck for the apples, which are by no means what you could call fair. A good many are deformed and wormy. This will, I think, partially account for the poor apple market. FREDERICK KRONMILLER.

We cannot understand what apple growers are thinking of to let the local markets go in this way. In every town and city of this nation may be found families who will gladly buy apples at a fair price. Left to the usual methods of distribution these people will eat but little fruit. With direct trade, good fruit and a fair price they will clean up every apple in the country and call for more. Our own experiment in advertising in the local market is so convincing that we cannot understand why growers neglect such opportunities!

*

WE know a man now over 70 who bought a farm and started to develop it on modern lines. There was one good-sized field which seemed just suited to Alfalfa. Our friend went to large expense to fit this soil. Several carloads of manure were plowed under, lime and fertilizer used freely and good money spent for inoculating material. A large quantity of Alfalfa seed was bought of a prominent seedsman and every plan suggested by the authorities was faithfully carried out at heavy expense. As a result this man has a fair seeding of Red and Alsike clovers with a scattering of Crimson. It is doubtful if there are a dozen Alfalfa plants on an acre. There can be absolutely no question about the fact that this mixture of clover seeds was substituted for Alfalfa! This man does not accuse the seedsman of cheating him. He thinks they simply tagged the wrong bag! Of course it is easy to say that this man should have sent a sample of that seed to the experiment station for examination, but the very character and reputation of this seedsman made such a thing seem unnecessary. Now what about it? At this man's age, such a blunder is a very serious matter. He has a stand of clover—worth less than half as much as Alfalfa would be. Under such circumstance what should the seedsman do? Get behind his "non-warranty" clause or pay fair damages?

*

EVIDENTLY the modern farmers' meeting demands a modern programme. About 25 years ago a few veterans met and solemnly discussed a lot of dry, general topics. They were all interested, and all agreed that such a meeting must be like an old-fashioned school-room. Then came the demand for larger meetings, and it was found that the younger people would not come out unless the programmes were made "popular." All sorts of attractions have been tried—concerts, prize speaking and even vaudeville shows. The older people may shake their heads and sigh for the old-time serious meeting, but "youth will be served," and the crowded gatherings of to-day are in line with the spirit of the age. Managers of horticultural and other societies, are stimulating their brains to try to think of new attractions for the young people. The Maryland society has a new one. Prizes of $20 will be given for the best essays by young people who attend the public schools. The boys will take this subject:

"Why the Maryland farmer's boy should remain on the farm."

The girls will struggle with the following:

"How social conditions in rural life in Maryland can be bettered by the daughters of Maryland farmers."

Good subjects—both of them. What a change has come since the day long ago when we heard at an agricultural meeting college boys discuss the question whether Milton was a greater freeman than Shakespeare! There is another novelty which the horticultural meetings might take up. We have suggested it for several years. Offer prizes to the farmers' daughters who make the best apple pies. Let those pies be made before the audience—not at home. Give each girl some good apples, a handful of flour, a lump of butter and such sugar and spice as she needs. Give her a table and a chance at a hot oven and let her alone! That will beat any prize speaking that ever came down the road. We would not object to acting as judge to sample the pies.

*

IT will startle many of our readers to be told that Buenos Aires, in Argentina, is the third largest city on the western continent. The latest report is that this Southern city contains more people than Philadelphia, and thus ranks next to Chicago. Very few of the people in this country have ever realized the possibilities of Argentina. We have dismissed the subject with the thought that great energy and substantial growth are only possible in the temperate zone! But Argentina lies in the south temperate zone, Buenos Aires, lying about as far south of the equator as Nashville or Cincinnati are north of it. A quarter of a century ago James G. Blaine, then Secretary of State, saw the wonderful possibilities of Argentina, and he tried to arouse interest in South American trade. Congress could not see into the future any more than it could see beyond the Mississippi when, years ago, statesmen tried to develop California and Oregon. As a result we nearly lost the Pacific coast, and the immense trade of the Argentine went mostly to Europe. Few of us realized the size of this trade until the shock of the European war showed what we have been neglecting so long. One thoughtful thing about the great growth of Buenos Aires is that it is largely built on the cultivation of Alfalfa. Argentina is largely an agricultural nation, and will long continue to be. It made rather slow progress so long as it depended upon its natural grasses or grains or its natural soil. From the introduction of Alfalfa culture on a large scale agriculture has rapidly gained, and has carried the general prosperity of the country with it. More and better food for stock has been made possible, and the soil has been improved so that all crops have increased. Thus the blessing of prosperity which has come to Argentina has literally come from the skies—in the form of nitrogen taken out of the air by Alfalfa. Much of this same prosperity will come to every nation or section or farm where this wonderful Alfalfa can be made to grow naturally. Twenty years from now we shall witness the truth of this statement in central New York, where Alfalfa grows freely. The farms in that section will be wonders for productive power, and the towns and cities will share in the prosperity.

"WHY should I keep purebred stock?" That was the question in the minds of 100 farmers seated in the demonstration pavilion at the National Dairy Show. These were men representing the majority of farmers everywhere. A speaker pounded home facts that have been recognized everywhere. A purebred has the ability to reproduce a superior animal; the chances are against a scrub. You may have a cow in your herd that will produce one, two, or three good calves, and the next one may be a worthless freak. You have no guarantee. The scrub and grade bulls are the curse of the country. The sire is more than half the herd. The grade sire may be but half the herd, but the purebred is three-fourths or seven-eighths or even more. In three or four generations the cow may be essentially purebred. It may not be possible for every man to purchase both purebred cows and a bull, but it is within reach of most men to own a purebred sire of any breed. There are bull associations which make it possible for the farmer to have access to the best; it gives the bull a chance, and keeps the cost of breeding down. The associations provide a bull for a block of 50 cows, generally 200 cows in the association, and a bull breeds the block two years and is passed on. The bulls that do not make good are sent to the meat block. This gives the sire his chance.

*

HERE is a remarkable incident which shows the mighty change which has taken place in the last half century:

This little incident may interest your readers, and "W. T.," who wrote the article on Delaware County, page 1226. The latter part of September I happened to be in that county, and there met an interesting family, who told me they had just "trekked" all the way from Chicago, in their auto, in search of the farm house they' visioned, and had not found it until they reached the fertile fields of Delaware County. In the olden days we trekked West in prairie schooners. The trekking is good East in motor cars these days, it seems. This forcibly also illustrated the custom of a foregone era, in that father and son cast their fortunes in together. Delaware County may be proud of attracting such people. A prosperous family, consisting of a father and mother in the prime of life, their sturdy son, and his very handsome young bride. J. C.

We have people on our list who went "out West" in wagons drawn by oxen—far into the wild prairie, where they settled and endured until prosperity came their way. In those days it did not seem possible that the hilly lands of New York and New England could ever again offer opportunity. Yet here is some of the money painfully earned from that old ox team invested in a motor car and bringing back the third generation to a New York farm. There is no other country in the world that can show such a curious outcome of history. No other section of the country can "come back" so vigorously as the strip 200 miles wide along the upper Atlantic.

BREVITIES.

A WHITE card for the Black walnut.

THE bushel crate is a good apple holding package.

No doubt that Fall plowing helps kill out the insects.

A NURSERYMAN is not necessarily an authority on babies.

THE wrong kind of a boost when old opinions formed before we knew—come home to roost!

MANY a farm carcass now wasted could be put into cans and sold or used as poultry food.

DID any county or township ever improve its roads without adding to the value of adjoining farm land?

THIS is the annual season for foot and mouth disease—the politician opens his mouth and puts his foot in it.

BALDWINS mellowing to decay in the tall grass of the orchard—unnamed frauds on the city fruit stands at two for five!

HERE is another new one—a potato paring and dish-washing contest at the agricultural exposition for Vermont boys and girls at Windsor!

DON'T forget to plant two trees for each one cut this Winter. This applies to woodland as well as orchard. We aim to try to help all to maintain good farm practice.

YOU would not consider Connecticut as a mining State, yet the minerals taken from her soil in 1913 came to $4,000,000, while Vermont gave a total of $9,647,985.

THE Massachusetts Agricultural College at Amherst has established a steam plant for rendering beeswax. This is at the service of Massachusetts beekeepers, who are invited to use it.

No sir! We would not knowingly plant a tree afflicted with crown-gall. Cast it into the fire. It seems like a crowning case of "gall" for a nurseryman to tell us this disease is not worth considering.

THE cover crop, the cover crop! Now is the time we see it stop the costly drain of nitrogen out of the soil in Autumn when the corn is cut and fields are bare and no live roots are feeding there.

WE receive a good many stories and pictures of hens or pullets which are said to have "records" of 300 eggs or more in a year! These are private records made on the owner's farm. You cannot blame us for limiting such printed stories to the official records made under the eye of some reputable public institution. We do not question these private records, but there should be some official evidence.

A CRITIC OF THE LAND BANK.

SOME months ago Herbert Myrick ventured to criticize the Land Bank of the State of New York, through the *American Agriculturist*, which, before Myrick's control of it was a respected farm paper. A few weeks later he indorsed the bank and urged Granges and other farm organizations to identify themselves with it, having, no doubt, heard from farmers in the meantime. He even called it a Myrick victory. Now he is out again in an attempt to discourage farmers in the use of it. Myrick clearly indicates by his criticism that he knows nothing about the Land Bank system. He simply knocks it because there is and can be no opportunity for him to benefit himself through it. Here is one of his arguments against it:

To keep the farmers out of it, the 10 member-associations comprising the Land Bank, must have aggregate resources of not less than $5,000,000, and must put up at least $100,000 in cash capital to start the land bank.

Myrick must know that forty-odd associations have already applied for membership in the Land Bank, and that at least one of them is composed entirely of farmers. He must know that the $100,000 of capital is already subscribed; and that the resources behind the bank already are over $20,000,000. He must know that this $100,000 is to be invested in first mortgages on farms and small homes, and that this capital makes available $2,000,000 more to be invested in the same way. Myrick says the system is a good thing for wage earners in cities and towns, but not for farmers. He makes this bald statement, but does not dare state any reason for it. He says the banking interest "slipped one over on the farmer." Will he tell us how? Will he explain to us how a banker is going to get any advantage out of the Land Bank that an individual farmer cannot get? As a matter of fact it is the one fiduciary institution in the United States organized exclusively on co-operative lines, and so safeguarded that no banker, capitalist or other interest, can get any advantage over the humblest member of it. And this is just why it does not suit Myrick and others of his kind. They want something that can be used by selfish interests to assemble the frugal earnings of the people, and place it in their hands for speculative purposes. Their real objection is that it does not furnish this; but they dare not plead for their selfish interests. They try to throw dust in the eyes of the farmer by a pretense of pleading his cause, while knowingly opposing his interest. The Land Bank system provides for the assembling of savings; and for the investment of it with the people who save it. It not only keeps the farmer's savings employed for himself in his own neighborhood, but it attracts capital to him from circles outside of his own realm.

New York State farms carry $100,000,000 of mortgages. Including expenses they pay in excess of six per cent. Some of them have been in existence 70 years. If one stands for 40 years, the farmer pays $60 annually for interest on every $1,000, and the $1,000 must then be paid in bulk. The German farmer pays 5.2 per cent. for 40 years, and the mortgage is then wiped out. Which system would Myrick recommend? The Land Bank brings the German system to the New York State farmer. Rates are higher here and for a while one may be obliged to pay more than 5.2 per cent.; but the systems are virtually the same; and when the soundness of our system is established, we will be able to equal or exceed the German terms.

Myrick implies a criticism of the Land Bank because it provides for substantial capital and resources. But the success of the system depends on its absolute soundness. The bonds of the bank will be taken up by farmers, laborers, frugal savers, and small investors generally as well as by bankers and large investors. They must be made absolutely safe for the widow and orphan. Hence it was provided that a safe ratio must exist between the capital and assets, and the bonds the Bank would be allowed to issue. This is not Myrick's style of financing and he could not be expected to approve it. Myrick borrowed money from farmers and farmers' wives under the pretense of giving them a building certificate in exchange, which was nothing but a receipt for the money, and no lien on the building whatever. When these people want their money, they are obliged to employ attorneys to get it. Myrick organized the Homestead Publishing Company, and tried to sell stock to farmers. The stock cost him about $8 and he sold it to farmers for $100. He sold them Good Housekeeping Company stock for 20 per cent. above par. He then sold the publication without their knowledge or consent, and they had to apply to THE R. N.-Y. to get their money. They never could find out what it sold for; but every publisher knows that the stock sold by Myrick to farmers for $120 was not worth to exceed $25. Myrick was indicted by a Federal Grand Jury through the Post Office Department. He was convicted of making false statements to the Department under oath. In the discretion of the judge he might have been fined or sent to a penitentiary. He was fortunate enough to get off on a fine. Myrick sold advertising space on a guaranteed circulation of 100,000 for his publication. The Post Office suit showed that his real circulation was 27,000. Some advertisers made a demand for the return of their money, and Myrick was obliged to return it.

Such is the man who sets himself up to farmers as a qualified critic of the Land Bank. J. J. D.

KITCHEN work in this country affects 8,000,000 workers. A plan or a trick for saving or shortening steps is a national blessing!

Substituting Corn for Cotton.

IT seems settled that there must be a decrease in cotton acreage in the South another year. Every public man in that section is advocating such a measure, and probably a large area now in cotton will be planted in corn or other crops. One outcome from this departure would be the fact that a decrease in cotton acreage means a decrease in labor, as one man can take care of many more acres of corn than he can of cotton. As the result of this the corn acreage must be largely increased, or there will be a drift of negro population to the towns and cities. All over the Southern States there are now vast tracts of idle land. Some of this was formerly cultivated with fair profit, but it has gone back to scrub trees or broom sedge. The trouble with most of this land is a lack of organic matter. Probably nowhere in the world can green crops for supplying this organic matter be grown to better advantage than in the South, and thousands of these acres can be readily brought back into cultivation. Such a large increase of corn culture would have a perceptible effect upon the general production of that crop.

Meeting of the Dairymen's League.

THE annual stockholder's meeting of the Dairymen's League will be held in Albany on Saturday, November 28; probably in one of the rooms of the Agricultural Department. There are over 13,000 of these stockholders, and it is important that the meeting should be largely attended, and all milk-producing sections of the State be represented, either personally or by a representative. Of course it will not be possible for all these producers to assemble in one meeting, but the different locations will undoubtedly select one of their members to represent them at the meeting, and care should be taken to select level-headed men for this mission. It is probable that members of the board for the coming year will be made up of the representatives present at the meeting, and this is another reason why the selection should be made with care, and strong, practical men sent to the meeting.

Producers are now pretty well organized and the success of the organization and the methods adopted will be put to the test this year. A serious mistake will not be fatal, but it certainly would put back the work. The time calls for strong, able leaders, and staunch support for them from the members of the association. The League has been developed along conservative lines by altruistic men who have given their time, and their thought, and their ability to the work, without expectation of compensation, and we venture the prediction that they will yet successfully work out a plan and a practice to improve the business of milk production and distribution for the metropolitan markets. The new Department of Foods and Markets will be a powerful aid in the work when it is completely organized.

Advertising on Apple Day.

THE Hampton County, Mass., Improvement League made a very practical use of Apple Day in advertising apples and encouraging sales. It seems that people in Springfield, Mass., were not eating near as many apples as they should have done. Local retailers were buying No. 2 apples at a dollar a barrel from the wholesale houses, and charging 35 to 40 cents a peck at retail. No. 1 apples, which cost them $2 or a little over, were being sold at 50 cents a peck, and with these prices sales were slow. The business men of Springfield were interested in using Apple Day for advertising Massachusetts apples. Mottos were displayed everywhere. *"Eat Apples and Live Forever"* seemed to be the favorite. The hotels, the big business men, including drugstores and drygoods houses, got into the spirit of the day and talked apple. In one case a man and a trained rooster were employed to walk the streets during Apple Day, with a basket of apples on his arm. No doubt the rooster entered into the spirit of the occasion with an occasional crow. It is said that by night the streets were covered with apple cores, and the consumption of fruit for that day was immense. The report is that this educational work has increased the demand for apples in Springfield fully 50%. Prices of apples from the producers have advanced fully 25 cents a barrel, and the local crop will be well cared for at home. This is good work by the League. It proves just exactly what we have always claimed—that no matter how large the apple crop may be, it will be fully taken care of if producers will only get out, show themselves and talk apple. Do not wait for somebody else to do this work for you; get out and do it yourself, and the returns will be sure.

New York State News.

DOG QUARANTINE IN SYRACUSE.—It appears that the control of the rabies situation in Syracuse is to be left with the city authorities provided they carry out the instructions of the State Commissioner of Agriculture. There has been a difference of opinion as to whether the city should be quarantined or not, by State authority, and Commissioner Huson visited Syracuse last week to investigate conditions. Upon assurances from the City Commissioner of Public Safety that he would handle the situation without establishing a quarantine, the Commissioner advised him to go ahead but laid down certain conditions which must be observed. As a like situation may arise elsewhere the conditions laid down by the Commissioner may be of general interest. All dogs running at large must be properly muzzled, otherwise they will be captured and disposed of. No dogs within city limits must be taken out of the city. Prompt reports must be made to the office of the Commissioner of Agriculture regarding dogs captured and the disposition made of them. The Commissioner impresses the fact upon the Syracuse authorities that many muzzles now in use afford no protection. This must be remedied.

FOOT AND MOUTH DISEASE.—Information having reached the office of Commissioner Huson that the foot and mouth disease was prevalent in certain counties in Michigan and Indiana, he has issued a notice and order forbidding the importation into this State of any horses, cattle, sheep, swine, goats or poultry, from the counties named therein. The fine for the violation of this order is $100 for each offence. In Michigan the counties quarantined against are Cass, Van Buren and Berrien and in Indiana St. Joseph, La Porte, Starke, Marshall and Elkhart. It appears that Illinois has also issued quarantine against these counties. Government quarantine has also been established.

GOOD POTATO CROP.—What is claimed to be the largest potato field in the State is that of E. C. Gleason, of Malone, which contained 43 acres in one solid potato patch. Mr. Gleason harvested about 11,000 bushels from the 43 acres. They were of excellent quality.

APPLES IN ONONDAGA COUNTY.—The manager of the Onondaga County Farm Bureau estimates the apple crop in that county at 100,000 barrels. This is about 10,000 more than last year. Practically all the fruit will be consumed locally. He also says that less than one per cent. of the trees in that county are sprayed. If that correctly reports the farm agent he would seem to have part of his work cut out for him for another year. We of New York State should enter no complaints about competition with the northwest when we let all but one per cent. of our trees go unsprayed.

NEW FARM BUREAU.—Orange County will have a farm bureau. At a meeting of farmers and others interested in the project, held at Goshen, October 24, Mr. Burritt, State Superintendent of Farm Bureaus, was present and explained the methods of organization and the purpose and work of the Farm Bureaus. It was voted to organize and these officers were elected: President, D. V. Farley, of Hamptonburgh; vice-president, John H. Arfman, of Middletown; secretary, C. B. Coleman, of Goshen; treasurer, Howard D. Seeley, of Goshen. C. B. Harlow, of Stony Ford, was elected representative of the county Grange, and Albert Manning, representative of the Board of Supervisors.

MR. MANNING APPOINTED.—Albert Manning, of Otisville, has been appointed by Gov. Glynn as a member of the Bovine Tuberculosis Commission, which was created by an act of the Legislature at its last session. Gov. Glynn has called a meeting at the executive chamber on Friday, November 6, for the purpose of organizing the commission. J. W. D.

Grain Notes by Experts.

BROOMHALL reports large wheat crops in India and Australia, and heavy receipts at Liverpool, where wheat is selling at $1.25 to $1.30 per bushel, and oats, 78 to 80 cents. In Hungary the import duty on all grain has been removed, yet prices are increasing rapidly, wheat at Budapest being $2 per bushel.

A report from The Hague gives the German wheat crop as 2,182,000 tons; rye, 8,401,000 tons, and oats, 5,949,000 tons, a total grain shortage of 1,764,000 tons from last year. The potato crop is about 6,000,000 tons less than last year, but as all exports are forbidden German authorities state that there will be ample food for home use.

Clement, Curtis & Co., say: "Our returns on the corn yield show a slight gain over last month and are indicating a crop around 2,700,000,000 bushels. The largest gains over last month are in Ohio, Iowa and Minnesota. Losses from the indications of October are largely in Illinois and Indiana."

Oscar Lyle estimates the following distribution of this country's corn crop:

	Bushels.
Mills for city use	136,476,000
Mills for farm use	107,040,000
Glucose and starch	40,140,000
Distilled liquors	21,408,000
Malt liquors	13,380,000
Feed in towns	117,744,000
Feed, horses and mules on farms	722,520,000
Hogs on farms	717,168,000
Cattle on farms	251,544,000
Milch cows on farms	230,136,000
Sheep on farms	58,872,000
Poultry on farms	96,336,000
Seed on farms	21,401,000
Exports, etc.	141,828,000
Total	2,676,000,000

Our estimated stocks of grain in storage are shown in the following table, the figures being thousands of barrels:

Woman and the Home

From Day to Day

BATTLE BUNNY.

Bunny lying in the grass,
Saw the shining column pass;
Saw the starry banner fly,
Saw the chargers fret and fume,
Saw the flapping hat and plume—
Saw them with his moist and shy
Most unspeculative eye,
Thinking only in the dew,
That it was a fine review—
Till a flash not all of steel,
Where the rolling caisson's wheel
Brought a rumble and a roar
Rolling down that velvet floor,
And like blows of Autumn flail
Sharply thrashed the iron hail.
Bunny, thrilled by unknown fears,
Raised his soft and pointed ears,
* * * * * * * * * *
As the sharp vindictive yell
Rose above the screaming shell;
Thought the world and all its men—
All the charging squadrons meant—
All were rabbit hunters then
All to capture him intent.
Bunny was not much to blame;
Wiser folk have thought the same.

Wildly panting here and there,
Bunny sought the freer air,
Till he hopped below the hill,
And saw, lying close and still,
Men with muskets in their hands.
* * * * * * * * * *
One—a grave and quiet man,
Thinking of his wife and child
Far beyond the Rapidan,
Where the Androscoggin smiled—
Felt the little rabbit creep,
Nestling by his arm and side,
Wakened from strategic sleep,
To that soft appeal replied,
Drew him to his blackened breast,
And—

But you have guessed the rest,
Softly o'er the chosen pair
Omnipresent Love and Care
Drew a mightier hand and arm,
Shielding them from every harm;
Right and left the bullets waved,
Saved the saviour for the saved.

Who believes that equal grace
God extends in every place,
Little difference He scans
Twixt a rabbit's God and man's.

—Bret Harte.

*

BOSTON brown hash is a savory way of using left-over meat. Chop any remains of steaks, roasts or stews very fine. Grease a deep pie dish. Put a layer of mashed potatoes (cold ones, left over, will answer) in the bottom of the dish, then a layer of meat, then a layer of bread crumbs; sprinkle with salt and pepper, a few bits of butter; moisten with a half cup of beef gravy, then put another layer of potatoes. Dip a knife into milk and smooth the top. Bake in a moderate oven until brown. Serve hot.

*

A PEACH Betty, according to an up-State recipe, is made by putting a thick layer of peeled and sliced peaches in the bottom of a baking dish, and there covering with a rich biscuit dough. Serve hot, turning the slices fruit side up as they are served, with hard sauce or sugar and cream. The dough used is not sweetened; the usual recipe is one quart flour, with two teaspoonfuls of baking powder well sifted in half teaspoon of salt, a tablespoonful of shortening and milk enough to make a rather soft dough that may be rolled or spread. Canned peaches may be used in the same way.

*

THE Farm Women's Press Association is much interested in the passage of the Smith-Lever bill which makes possible appropriations, in each State, for demonstrations in home economics. The Association makes the following statement of things a State farm woman expert can do:

She can tell us: How to save steps in our kitchen work. How to get running water either from springs or by windmill power. How and where to get simple labor-saving devices to lighten our work. How to form afternoon get-together meetings where we can study these things; where we can work for better schools and better roads; where we can talk up coöperation in selling eggs and butter and in buying supplies. How to improve our lighting, heating and sewage systems.

We have commented, more than once, on the advantages offered to poor women in the cities, through free lectures and demonstrations in hygiene, home economics, the care of children, etc. They have many possibilities denied even to women in comfortable circumstances in the country. An appropriation for extension teaching will bring some of this instruction within reach of rural women too.

Workaday Dollies for Holiday Time.

MOST girls love dolls, even after they grow too large to care to play with them openly. Why, then, should they not enjoy making and dressing them, especially at holiday time, when fingers that have scarcely learned to sew, feel the itch for a needle with which to make something as a gift for a friend? Since it is an open secret that many really grown-up girls love them, and possibly some boys as well, could there be anything nicer, either to make or to receive at Christmas time, than dolls? These may be something more than the well-known playtime dolls, beloved of the little ones, each one having a place and purpose in the workaday world. There are many such dolls, and every member of the family may have one, from the oldest to the youngest. Should you decide to confine your gifts this year to dolls, permit me to introduce you to several members of the workaday doll family:

To begin with the simplest, let us make a pincushion doll for Big Sister! For this you will require a small, unjointed doll four or five inches long, which you can get for 10 cents, and half a yard or more of ribbon in Sister's favorite color. Both the width and length of ribbon will depend on the size of the doll. It should be just wide enough to go around the doll's body, half way down her arms, and long enough to come well down over her feet. Fold the length of ribbon in half, and cut a hole in the centre large enough to slip over Dollie's head. If it comes rather low on the shoulders no matter, for low necks are fashionable. Fold the ribbon in underneath the arms to form sleeves, and fasten it there. Tie a narrow ribbon about her waist for a sash, and edge the neck with narrow lace to conceal the raw edge. Dollie's petticoats, of which there are two both front and back, are strips of thin white flannel or flannelette, cut a little narrower than the ribbon and buttonholed around. Fill these with assorted pins and sew a loop of narrow ribbon to her waist at the back from which to hang her beside the dressing table.

For Mother or Auntie you may make a broom Dinah, the foundation of which is a child's toy broom. Dinah comes "riding on a broomstick," and she will prove most useful in cleaning behind pictures or under radiators where a big broom will not go. The easiest way to dress Dinah is to use one of the stamped cloth doll forms. Cut the body in two just below the waist line, discarding the legs. Slip the upper portion over the broomstick down to where it joins the straw, and stuff all around the stick to properly fill out the doll body, fastening the top of the head very carefully and neatly around the stick. Now make a dress for her from some bright material, the skirts reaching to the bottom of the straw. Add a big apron of gay color, and a bit of plaid about the head for a handkerchief. Or if you have not the stamped form you may use a piece of black stocking, drawing it well down onto the straw, and stuffing just above where the stick joins it to form a waist: tying close to the stick to indicate a neck, then stuffing a smaller round above that for a head. Sew on white buttons for eyes, and indicate mouth and nose with a bit of red yarn; add hair or wool of raveled-out stocking, and roll up pieces of stocking to form arms, which sew in place. Dress as suggested for the other Dinah.

For Little Sister nothing could be nicer than the milkmaid doll, especially since her attractive personality may prove an incentive to a closer acquaintance with sewing materials. This is merely a small, unjointed doll with feet firmly glued to a small board so that she will stand upright. Her dress is that of the Holland milkmaid, with wide, short skirts, apron, and pointed waist. Her white, tall-crowned cap is left open at the top to provide for hiding a thimble. Her skirt conceals a pincushion, her apron is a needlebook; while across her shoulders is an equivalent for the neck-yoke of the peasant woman, the water buckets in this case being spools of thread suspended by cords to a crochet hook which is fastened in place across the shoulders.

Papa or Big Brother will be glad of the pen-wiper doll, which will prove useful for the purpose suggested by its name. Also the year-old baby may be safely trusted to find a use for it; the yarn dolly being too soft to hit back, is just right for chewing, and will endure hard usage. To make her take a ball of heavy darning cotton in any preferred shade. Wind the yarn around a thin book about eight inches long. Slip a stout thread under the strands at one end and tie tightly; then clip the strands at the opposite ends quite through. Remove from book, and from the tied end separate several threads and plait into braids to simulate Dolly's hair. About an inch and a half below the first tying tie again, the threads above this tying forming the head. From each side below head separate sufficient threads to form arms, cutting off about one-third of their length and tying near the ends to form hands. Tie a piece of colored ribbon a little above the middle, this being the sash about her waist, and all Dolly lacks is features. These may be simulated with colored threads, when she is ready to take up the duties of a busy life.

Grandmother will be sure to like the door-tender dollie, she being substantial enough to hold doors open at any angle, whatever the weather. For this procure a bottle with a heavy base and long, gradually sloping neck. A quart size milk bottle will do very well. Fill the bottle with coarse sand to give it weight, then fasten firmly in the mouth of the bottle a doll's head and shoulders. Dress the doll in housemaid style with black dress, white apron, cuffs and cap; the flowing skirts concealing the sand bottle. If preferred you might make this a Dinah doll also.

The Brownie Doll is usually the hardest worked member of the working doll family and cannot fail to please Little Brother, and possibly other members of the family at the same time. To make him roll up one of Father's discarded cuffs to about two inches in diameter, and fasten firmly. Glue or sew a piece of cloth over the opening at one end, to which sew slender rolls of brown cloth four inches long, to form legs. Make long, slim arms in the same manner, and fasten in the appropriate place. Near the top of the open end draw features with ink on the white ground, giving him as jolly a cast of countenance as possible. Now drop inside Mr. Brownie's body a large glass marble, and close the end securely. This end, which is the head, should be surmounted by a red cap, while a brown swallow-tail coat and shoes and gloves, (cut from old kid gloves) may complete the toilet. To induce Brownie to show off, you have only to set him at one end of an inclined board, (Mother's ironing board set one end on a chair, the other on the floor) give him a little push, and he will do the rest. The series of delightful somersaults and jerky contortions which follow will delight his audience, both old and young. Tiny bells sewed to each hand will add to the grotesque appearance of this clown doll.

inch material. 7860, Girl's dress. Cut in sizes 10, 12 and 14 years. Size 12 requires 4½ yards of 36 inch material. 7809, Girl's one-piece dress. Cut in sizes 8, 10 and 12 years. Size 10 requires 3¾ yards of 36 inch material.

No. 807. A design for embroidering a pillow or cushion top, 24 inches wide by 18 inches deep. The flowers are designed to be worked in French knots placed close together, the leaves are designed for solid embroidery and the lines enclosing the design to be outlined. When making solid embroidery, pad the stamped figures by darning backward and

forward lengthwise and then cover closely with over and over stitches worked in the opposite direction from the padding. Stamped and tinted on gray linen, 18x24 inches, with same back and mercerized floss to work, 70 cents.

Seen in New York Shops.

ONE new collar consists of a band of black ribbon velvet 1½ inch high, with a two-inch knife pleating of lace or organdie at the top, giving the effect of an Elizabethan ruff. The velvet is closed with snap fasteners, and there are three small satin buttons over the closing. There are many collars made like Medici ruffs, standing up about four inches high at the back, and coming down to a V in front.

Skirts are much shorter than they have been, and we are told they are to be worn a full eight inches from the ground. Such skirts are full, falling in ripples. A full skirt made very long is always a nuisance, and there will be much relief in having it clear the ground well all around. The new jacket suits with short full skirt and braided military coat are very jaunty and comfortable.

One of the high-class stores recently made a new departure in offering tablecloths, napkins, towels and toweling of cotton or cotton and linen mixed. Such materials have of course been on the market for some time, chiefly in stores catering especially to people of small means; undoubtedly they have often been sold as linen. These fabrics are now mercerized in imitation of linen, and are greatly improved in quality, so that they are highly recommended for their wearing qualities. Flax has increased greatly in price, and is likely to increase still further, so this is a good time to help our own cotton growers. The sellers claim that mercerized cotton, or cotton and linen mixed, will give better wear and more satisfaction than a poor grade of all-linen. Prices are very moderate; tablecloths from 85 cents to $1.75; napkins 75 cents to $1.50 a dozen; towels 60 cents to $1.50 a dozen; towels of cotton and linen mixed $2 to $3 a dozen; mercerized cotton damask, 30 to 55 cents a yard.

A very smart blouse to be worn with a black tailored suit was of flesh-colored chiffon, with a bolero of black chiffon bound with black silk braid and having black lace insets.

Many serge and broadcloth one-piece dresses are embroidered in self-colored beadwork, one color only; small beads are put on in a pattern like braiding. An example was a long-waisted moyen-age dress of dark blue serge, having a girdle of dark blue beads applied to the material, with further beading on cuffs and collar opening; the collar of white silk was high and close at the back, and open in front.

Heavy corded gros-grain ribbon, like that used for the bands on men's hats, is much in vogue for women's velvet hats; it is put on in masculine fashion, with a small flat bow at the side. A hat of this style often has small wings or fan-shaped feather ornaments put at a jaunty angle at one side of the top of the crown.

Colored handkerchiefs are again seen in all sorts of shades, red, blue, green, purple, orange or wood brown. They are of extremely fine linen, with a quarter-inch hem and an initial embroidered in a darker shade. Some have a border of white net footing, put on quite full.

American-made kid gloves are among specialties offered by one big firm, which handles foreign gloves largely, but states that those of domestic manufacture are better than those from abroad at the same price. Among them are attractive slip-on gloves with wrist straps.

Light-weight pique in narrow wale is the favorite material for collars, cuffs and vestees with tailored suits. It launders well, is inexpensive, and has enough weight to keep in place well, being more satisfactory in this respect than the starched linen.

Saving Labor on Washday.

TRY for once this way of disposing of the weekly washing, and see if you like the plan. Put a lot of cold water and dissolved soap-powder or soap into the boiler, and immerse therein as many of your white clothes as you care to at once. If there are any especially soiled white pieces put them to soak in cold water until such time as the boiler is ready for them. Then form a nice suds in the tub and wash and rinse the daintiest of the colored clothes as quickly as possible, then darker and more soiled pieces. If you have a good fire the first white clothes are usually ready by this time, and you can slide right ahead to the end of the job. It is so restful not to have a lot of soiled stockings for the last! A. D.

More Chili Sauce.

EIGHTEEN tomatoes, six onions, three peppers, chopped fine; two tablespoonfuls salt, one mustard; one teaspoonful cinnamon; one-half teaspoonful cloves; one cup sugar; two cups cider vinegar. Very good. MRS. VERITY.

One peck tomatoes; two quarts onions; two stalks celery; eight green peppers, one red, all chopped fine; two two quarts vinegar; two cups sugar; one teaspoonful each of cinnamon, allspice, ground mustard, cloves, ginger, salt to taste. Cook tomatoes first, and strain, then add other ingredients and cook about an hour. Very good.

FARM STOCK BREEDING.

Cattle Stock Breeding.

PART IV.

SO varied are the conditions under which cattle are maintained in this country that the popularity of special breeds and their management differ widely. As long as there are areas of pasture land not yet settled upon, beef cattle on these pastures are the main reliance of the general farmer. As the country becomes more settled, markets are opened up and there comes a gradual change. Villages are formed nearby and transportation makes it possible to ship dairy products long distances with no harm resulting. Under these conditions, dairying which can only prosper upon the cultivated farm, displaces beef making. This is especially true where land values have so increased as to make the raising of beef cattle unprofitable except in combination with the dairy cow.

HOLSTEIN COW, VALLEY FARM TOPSY, 59589.

Official record, milk, 80.9 lbs. one day; 551.6 lbs. seven days. Butter, 24.17 lbs. seven days, 99.87 lbs. 30 days.

There is no want of breeds from which to select if the farmer is engaging in the production of beef. Among the most popular are the Hereford, Aberdeen Angus and the Shorthorn. These breeds all originated in Great Britain where the beef cattle business is a little more advanced than in this country. These three breeds are suited to different conditions and surroundings. The Hereford will do somewhat better on pasture than either the Shorthorn or Aberdeen Angus but the last two breeds will do better in confinement—in other words, they can stand the heavy grain feeding which forces early development without showing "patchiness." On the western ranches, Hereford cows are most popular because they give such a small quantity of milk and there is little danger of milk fever. Shorthorn bulls used upon such cows make a fine beef animal for the market as the two breeds tend to reinforce the weak points of one another. Avoid anything but the first crosses, however. The weakest point of the Shorthorn is the crops, and a tendency to a flat rib, while in these particular points the Hereford is strong. On the other hand, the Hereford is usually weak in the hind quarters where the Shorthorn is especially strong. The combination of the two breeds gives a very evenly developed carcass, the meat of which is well marbled and high in quality.

The influence of the purebred sire is just as pronounced in beef cattle as with other classes of livestock. The ideal beef bull is a far different shaped animal from the dairy sire. The beef bull is a beautiful animal to look upon while the dairy sire is too angular to present a good appearance. In the beef animal we look for the rectangular or parallelogramic conformation which usually gives a carcass of good fleshing qualities and meat so evenly distributed that the body is said to be symmetrical.

VALUE OF BEEVES DETERMINED BY HIGH PRICED CUTS.—I have seen the butchers walk into a herd of young beeves and say to the owner: "We will give you $42 apiece for those three animals there," pointing out three special steers. "We will give you $35 apiece for those six and the rest we will take at $30 per head." I wondered at this and asked the butcher why those three steers were worth so much more per head than were the others. He explained to me that by their conformation and development, when dressed they would give a much higher weight of round steak and loins—those parts of beef which bring the most in the market—than would the other steers. The answer was logical enough and when I looked more closely, I could see that these three steers did excel in the weight of high priced beef. This was an eye-opener and it gives us the cue as to what we should desire in a beef sire. A good beef sire must be strong in the hind quarters, well muscled and with a good length and proportion of loin. How can we expect to get choice prime beeves out of the young stock when we use a cat-hammed sire? While it seems a trifle far-fetched to call the limbs of any of the beef bulls "cat-hammed," yet when we see two of them together, it is usually easy to pick out the one which has the most meat on the steak and loins. Although a great deal is said about the purebred dairy sire, the purebred beef sire has just as good a chance to improve the progeny of the herd as has the dairy bull.

CONSIDERATION OF DAIRY BREEDS—The most prominent dairy breeds are the Jersey, Guernsey, Holstein-Friesian, Ayrshire, and Brown Swiss. Each of these breeds, like the breeds of beef cattle, is suited to somewhat different conditions, and on account of having been developed in different environments, each presents peculiarities which are common only to the members of the breed. The native home of the Jersey is the Island of Jersey, in the English Channel. These cattle have not been reared on abundant pastures; in their native home, they are usually tethered or "staked out." The inhabitants of the Channel Islands were among the first to take steps toward keeping the blood of their cattle free from infusion of outside blood. They made a law that no cattle should be imported to the Island of Jersey for other than consumption purposes and these must be slaughtered before the expiration of a certain number of days. Such close watch over the purity of the blood of these cattle, has given the Jersey breed a refinement which is scarcely possessed by any of the other breeds. The individuals were prized for their rich milk and consequently, the Jersey is today a rich-milk breed of persistent milkers, milking all the year round. They are smaller than any of the other dairy breeds, of a light, dark brown, or even black color and possess the tri-wedge conformation which is so highly valued in dairy animals.

The island where the Guernsey breed was originated is only a short distance from the home of the Jersey. The Guernsey breeders practiced the same supervision of the blood which was brought to the Island but they did not commence this as soon as did the Jersey breeders and they were not so particular about color. Guernseys may be fawn and white or a clear fawn while some of them very nearly approach a red. The Guernsey breeders did not pay so much attention to form; they bred for a persistent milker, giving a rich yellow milk and that is what they secured. As a consequence, the Guernsey has rather less refinement of form than has the Jersey and giving a medium, annual weight of milk which is rich and yellow. Here, let us settle the fact that the color of the milk is no indication as to amount of butterfat which it contains. Butterfat is seldom present in milk in sufficient quantities to give the milk a color. The yellow milk of the Guernsey is yellow because of a pigment contained therein while the Holstein milk is blue because of a blue pigment which it contains.

The Holstein-Friesian cattle have been found in Holland for over 2,000 years. We have mention of them in history that far back as the "black and white cattle of Holland." They are larger than either of the two dairy breeds mentioned before. The Holstein can consume a larger amount of food in confinement. In quantity of milk, this breed far surpasses any of the other breeds while the quality is only medium. There has been a tendency, especially when the Holsteins were first introduced into this country, to regard them as skim-milk cows and although their milk is not quite as rich in butterfat as the Jersey or Guernsey, Holstein breeders have been constantly striving toward a higher percentage of fat. Now, the average for the Holstein breed is around 3.5 and many Holstein cows and strains of them are averaging as high as five per cent. butterfat.

The Ayrshire is a Scotch breed of medium-sized animals. Their one point of excellence over any of the dairy breeds is the udder which is recognized by dairy judges as being as near perfection as can be had. The animals are red and white and as there are so few of them in the United States, their breeding is a local matter.

The Brown Swiss are worthy of mention. Previous to six years ago, this breed of Swiss origin was deemed by American breeders to be a so-called "dual-purpose" breed. About six years ago, the Brown Swiss breeders determined to make their breed conform more to the dairy form. They have accomplished wonders in this short time and now some of the individuals of the breed are making records which are comparable with the other dairy breeds. The cattle are a mouse color with a light brown stripe down the back.

EXTERNAL FORM NOT A POSITIVE INDEX TO PRODUCTIVE CAPACITY.—As to judging the points of a dairy cow by an external examination only, I do not think it amounts to much. As far as I can see, the judging of dairy cows by conformation only is one of the biggest will-o'-the-wisps of the stock judging pavillion. We do know that the former World's Champion Guernsey, Spottswood Daisy Pearl, was at one time placed at the end of the list and in the tenth place by a prominent dairy judge who was judging productive capacity by conformation only. Those cows of the dairy breeds which took the prizes at Chicago last year were not the most productive animals that the exhibitors had in their herds. As a general rule, however, the tri-wedge conformation goes with high productive capacity while the udder should be well hung, of good size with teats well placed. All the finer points of dairy form are good only when associated with a superior producing animal. The real detectives on the trail of the dairy cow are the Babcock test and the milk scales. These, taken together with the amounts of feed consumed, rarely fail to give evidence which should oust the unprofitable ones.

GRADE UP FROM MONGRELS OR GRADES.—As for cows with which to start, do not make the mistake of thinking that they must be purebreds. Let the first real start begin with the dairy animals that are already on hand; some

SPRINGDALE FARMS Is the best place to buy GRADE HOLSTEINS

200 Cows and Heifers always on hand. Largest, finest individuals, heaviest milkers. Registered bulls, Pontiac & Colantha breeding.

F. P. SAUNDERS & SON, Cortland, N. Y.

Office, 50 Clinton Ave.

Purebred Registered HOLSTEIN CATTLE

The University of Missouri has a herd of thirty-five purebred registered Holsteins all descended from four cows purchased ten years ago for $450. Animals have been sold from this herd for breeding purposes to the amount of five times the cost price and the herd now contains more than thirty cows worth at least ten times the cost of the foundation stock.

Here is an object lesson for any man ambitious to go into dairying on a money-making basis.

Send for FREE *Illustrated Descriptive Booklets*

Holstein-Friesian Asso., F. L. Houghton, Sec'y, Box 105, Brattleboro, Vt.

of them are good dams for the future stock. Cull out the poor ones each year and soon, if a sire is used that is worth his keep, a herd of high producing grades will result.

As to the relative value of dairy bulls in grading up the herds, we have the following quotation from Ohio Experiment Station Circular, No. 135, page 81:

"One Holstein-Friesian bull used in the Ohio Experiment Station herd increased the average production of his seven daughters 1,299 pounds of milk and 40 pounds of butterfat per year above that of their dams. Forty pounds of fat per year for six years (average producing period) by each of seven cows would be 1,680 pounds of fat; 1,680 pounds at 30 cents per pound equals $504. This animal cost $100 when a calf. One Jersey used in the Station herd decreased the average production of his 11 daughters over 700 pounds of milk and over 45 pounds of butterfat per year below that of their dams. Forty-five pounds of fat per year for six years by each of 11 cows would be 2,970 pounds, which at 30 cents per pound would equal $891. The immediate difference in money value of these two bulls on these herds of less than 20 cows each was $1,395. Both bulls had an equally good chance to increase the production."

The essential points in dairy breeding are to get a good bull with an ancestry of high producers. If possible, keep records of milk weights and tests and keep setting the standard higher as the years go by and the cattle improve. Stick to the same breed. Above all, keep the weather eye out for signs of contagious abortion and tuberculosis. They will ruin the best herd of cattle in the world if they once get a foothold.

Michigan. I. J. MATHEWS.

Decrease in Butter Fat.

ON page 1039 is an inquiry relative to the decrease in butter fat. F. C. M., in answer, gives one to infer there should be a decrease, and that less than one-half as much butter would be made from 20 pounds of milk than from 40 pounds when cow first freshened. This is contrary to my experience. My records show that my cows make about the same amount of butter when giving 20 pounds of milk per day, as when during the first few months after freshening they gave 40 pounds per day. If milk will not test higher in butter fat when the smaller amount is given, how can this be accounted for? E. E. S.

Skowhegan, Me.

E. E. S. has misinterpreted my reply noted on page 1039. It is true that the butter fat test of milk is inclined to increase as the amount of milk produced decreases. However, the physical condition of the cow is a factor that must be considered. In this connection it is interesting to note the following taken from "Milk and Its Products," by Wing, page 27:

We find that there are a large number of conditions that affect the quality of the milk, meaning, thereby, the relative proportion of the various constituents, and particularly the proportion of fat to other constituents. Some of these changes are regular and progressive during the period of lactation, others are due to definite causes and still others occur from time to time to which we have as yet been unable to ascribe any definite cause. After about three or four weeks of lactation, the percentage of fat in the milk remains nearly constant until the seventh or eighth month, or until the quantity of milk begins to rapidly diminish.

There is no question but that under certain conditions there would be a difference in the butter fat test during the lactation period of the cow, if comparison is made at freshening time when she is giving 40 pounds of milk per day, with the period nine months later when she might be giving 20 pounds of milk per day. However, it is unusual for cows to give as much actual butter fat when they are milking only 20 pounds per day, as was the case when the animals were producing 40 pounds per day. If the records of some of the officially tested cows are considered, it will be found that in some cases unusually high butter fat tests are recorded at the outset of their lactation period. Such animals, no doubt, have been given a long dry period and carry an unusual amount of flesh at calving time. F. C. MINKLER.

How Much Live Stock?

I HAVE a farm of 200 acres; 25 in wood, 25 in ordinary hillside pasture, 30 in fruit and 120 in crops where hay, oats, rye, corn and buckwheat can be raised. On how many cows should I figure, how many hogs, how many chickens, so that all the waste products in making butter would be utilized on the farm and that in figuring on raising as much feed as possible I would have to buy the least amount of feed? G. W. K.

New Rochelle, N. Y.

The producing capacity of any given area varies a great deal, and it is rather unsatisfactory to attempt to give definite suggestions as to the number and kind of live stock that could be most profitably produced on this farm without knowing more about the condition of the soil and its ability to grow average crops. A still further question might be raised as to the owner's experience in crop production and dairying; for it is possible to maintain successfully relatively large herds on comparatively small areas.

Assuming that the 120 acres are utilized for crop producing and a rotation planned whereby 40 acres could be devoted to the growing of corn, 40 acres meadow and the balance used for other crops, it would seem reasonable to maintain a herd of 25 milking cows, and as much young stock as one would care to select and grow from such a herd of grade cows. The number of hogs that may be kept is even more indefinite, but I am satisfied that where cream can be marketed and the skim-milk kept on the farm that the pork industry deserves extensive development and if sufficient areas can be fenced and used for forage crops for swine, I would not hesitate to keep 15 or 20 brood sows on such a farm. It might necessitate the purchasing of some additional concentrates, for this is always advisable up to a certain limit.

A flock of 200 birds at the outset might establish a unit that could be added to or reduced as one's experience might suggest. The aim should be to grow silage and Alfalfa hay as a basis for feeding the dairy herd, while corn and rye could be fed successfully to the pigs. I doubt very much if there is any profit in oats for the average Eastern farmer if they are grown alone, but when mixed with Canada field peas there should undoubtedly be a place in the rotation for this crop. Rape and Soy beans make a most excellent forage crop mixture for swine, the proportions being six pounds of rape and one bushel of Soy beans per acre seeded any time from early Spring to August 1st.

F. C. M.

LIVE STOCK NOTES.

THE Ayrshire cow is proving her worth in view of recent Canadian tests. To June 1, 454 cows and heifers have registered in the Canadian Record of Performance. These gave an average of 408 pounds of butter, a splendid average, 189 of the number being two-year old, and 82 three-year-old heifers. One cow gave over 850 pounds of butter, three over 700 pounds, 22 over 600, 30 over 550 pounds, 70 over 450 pounds, and 140 over 400 pounds.

The treatment of hogs exposed to contagion from cholera has saved all but 2.27 per cent. in the Southern States, according to reports received by the Department of Agriculture from local agents engaged in demonstration work. The report shows in one year a total of 34,636 inoculated hogs in good health exposed to disease only 787 died. In case of animals so affected with cholera that symptoms were plainly visible, in these 7.15 per cent. were saved by the agents taking a "fighting chance." Inoculation is not sufficient; the animals should be kept in sanitary quarters, and free from lice and worms. The following Kentucky formula is recommended for worms: Santonin, 2½ grains, areca nut, one dram, calomel, one grain; sodium carbonate, one dram.

The margin is too narrow between prices of butter in New Zealand and this country to insure heavy shipments. The present margin is six to seven cents per pound. The dairy population was greatly reduced in New Zealand owing to elimination of the bourder cows caused by shortage of feed last year.

There are 30 creameries in Montana and only one cheese factory. The Montana farmer might buy another cow.

Winter course in dairying at Cornell opens November 10 and closes February 12. The course will cover dairy bacteriology, buttermaking, cheddar cheese making, market milk handling, and dairy mechanics.

There have been practically no importations of draft horses since the opening of the European war, except possibly from England, and in limited numbers. There is sufficient good stock in America for all practical purposes, and the present European crisis will place American stock on its own merits. Previous to the war the United States imported from 2,500 to 4,000 for breeding purposes. The standard of the purebred draft horse will in no way suffer.

There will be a great demand for American horses during the war in Europe, and for a decade following it, is the opinion of the United States Department of Agriculture. Foreign agents are purchasing horses in the United States and Canada, and it is emphasized that only high quality animals should be reared. Inferior horses are a drug on the market. Next to Russia, the United States has more horses than any other country, and the two countries possess 58 per cent. of the world's supply. The German army for complete mobilization, requires 770,000 horses, and the French army about 250,000. These are probably figures for cavalry use only. During the Boer War the British Government secured 100,000 horses from the United States, and it is doubtful whether this number could be secured at the present time except at excessive cost. At the present time there are over 1,000,000 horses in the European service. The great majority of these horses are used in agricultural pursuits, and requisitioned only in the time of war. Before the planting of crops next season the shortage of horses will be keenly felt, and already rural credit for the benefit of farmers is being urged which will make it possible for them to secure motor equipment. This is being proposed in Germany. The United States army furnishes a desirable market for horses, and demands under the remount system at least 5,000 horses annually. There are now abont 20,000 horses in the army on a peace basis.

Sheep men declare that the wool pays for the keep of the sheep. Where this is true there is a nice profit left in increased stock and sale of surplus stock. There is a value in dollars and cents to the farm where sheep are kept, particularly where the farm is so fenced that they can be shunted from one field to another. One farmer advises if he had no sheep he would give free pasturage of a certain fields for some weeks for the benefit the sheep would afford. If the farm is well fenced, allow the sheep the run of the wheat and oat stubble after the grain has been removed. They will secure feed for some little time, and will clean out the fence rows. Turn them on the corn stubble after the crop has been removed, and they will clean up the waste food and make steady gains. Sheep will work under hedges, will clean up briars, there will be no goldenrod left in the pasture when they are through. The field is cropped as close as a lawn, there are no daisies or other weeds left in the field.

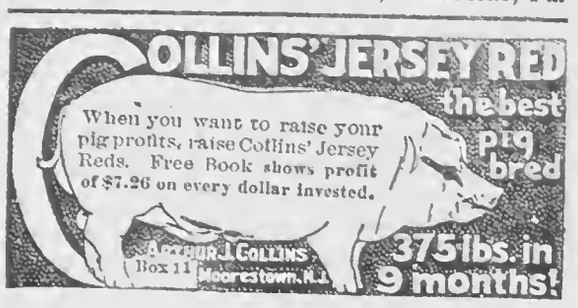
Large Berkshires at Highwood
Just sold eleven sows for export to Argentina. Makes fourth exportation this year. We sold 475 registered Berkshires during 1913, which is over a hundred more than any other swine breeder in the U. S. Most of these went to old customers, which speaks for itself. Selected animals all ages for sale.
H. C. & H. B. HARTENDING, Dundee, N.Y.

Berkshire Boars for Winter Service
About Christmas time I will have a deluge of letters asking for boars fit for immediate service. The wise ones are buying now and putting them at once in their permanent quarters, so that Mr. Pig will feel quite at home and have his mind on business when the New Year's rush is on. DON'T DELAY. BUY TODAY
R. Y. BUCKLEY, Woodrow Farm, Broad Axe, Pa.



MAKING SMALL CHEESE.

TAKE 20 pounds warm milk, add sufficient rennet. When thick cut into checks. In half an hour dip the curd into a drainer. After draining cut the curd with a knife and pour on to it two quarts of hot water. Drain again. Chop the curd, salt it and press it. If you expect to make a good cheese the first time, you will be sadly disappointed.

In the first place get a calf's rennet from the butcher. Have him clean it. After soaking a day or two in salt water you can pack it away in salt to keep it for future use. For making cheese, cut off a piece two inches square, more or less, and soak in water over night. Take a teaspoonful of the liquid and test its strength by using it in skim-milk. If it thickens in about half an hour it will do. If it takes longer you must put in more rennet. If it thickens sooner don't put in as much rennet. Too much rennet makes the cheese dry. Experiment with warm skim-milk before you dare to use the whole milk. Keep the milk as warm as new milk or in cool weather a little warmer, by setting in a dish of warm water.

When the milk has thickened so that you can cut it into checks, take a long, thin knife and cut 'way to the bottom, making checks two inches square. Let it stand a few minutes longer, then take a new dish drainer, lay a piece of cheese cloth over it and dip the curd into it. Frequently draw the corners of the cloth towards the center to let the whey off, but don't hurry it or you will start the white whey. After it is har' enough to cut into slices, or chunks, put it in a bowl and cut it across a few times, then pour on two quarts hot (not boiling) water. Drain and chop. Salt it, not too salt. Too much salt makes it dry. Try one tablespoonful first, next time, more or less.

For a hoop, take a can that will hold about 1½ quarts. Cut out the bottom with a can opener. Put in a cloth over the top of the can and press it down into the can, then put in the curd. When full lay your hand over the curd and draw the cloth up smoothly all around the side of the can. Lay one corner of the cloth smoothly over the top. Lay a round piece of wood on top and put into the cheese press or under a weight. The round piece of wood, which we call the follower, must be just large enough to fit into the can, not too small, or your cheese will have a rim. If you can't find a wooden piece you may be able to find the cover to a smaller can which will just fit in.

Don't put too much weight on at first. Keep adding more weight until you have enough to press it down firmly. Be careful not to start the white whey. At night take out the cheese, lay the cloth in the can as before and put in the cheese the other side up. Put on the weight and press until morning, then take it from the can, rub it all over with butter, lard or bacon fat. Keep in a warm place. Turn and rub every day. In two weeks or less it will do to eat.

Take these few hints to start with; varying them as you see fit. With good milk, good rennet and good courage you will be able to get some nice little cheeses just large enough to carry for your lunch on an automobile trip.

Maine. MRS. A. L. LIBBY.

PACKED BUTTER.

IN answer to A. B. S. of Massachusetts, page 1250, in regard to packing butter, there may be more than one reason why the butter put down for home use did not keep. There are times when the milk is not in good condition when it comes from the cow, owing to some food eaten or to tainted drinking water. The cream from such milk will not make butter of good keeping quality.

As the cream is from only two cows it may be kept too long before churning. I have known cream to be kept a week in some cases before churned. This is too long to be able to make good packed butter, for if the cream is kept at a good ripening temperature it will become too sour, and if kept cold will very often develop a species of bacteria that produce a bitter flavor. As A. B. S. says, if sanitary methods have been followed it can be nothing along that line. I would think the trouble might be that a too thin cream has been run. I would suggest that a cream not less than 35% be run, not kept more than two or three days at a moderately low temperature of about 65 to 70 degrees.

As this is home making we assume there is no acidity test to use, so must depend on the taste, and will call it ripened when a good clean, sour flavor is secured. Cool for at least two hours to about 60 degrees. Churn and wash with good clean water of about the same temperature as the butter-milk. Salt from three-quarters to one ounce per pound, according to taste. I suggest working thoroughly at once, as never is butter in better condition to work than when it first leaves the churn if firm enough to insure a good body.

From now two methods may be used, packed solid in clean stone jars or crocks, covered with a circle of thin butter muslin, then a layer say of one inch of salt. This must be kept in a cool dry place.

The second method is to form the butter in prints (or rolls) wrap in a parchment butter paper as if to be put on the market, pack as closely as possible in a large stone jar and pour a strong cold brine over this, completely covering the butter. This is a handy way for home use, as a few pounds or as much as is needed for a week's use may be taken out, the brine rinsed from the paper covered butter and it is ready for the table. From time to time a handful of salt may be added as the brine weakens. This certainly is a splendid way to keep butter and has been well tested. For several years, butter made in my husband's creamery with the ordinary dairy methods and no particular preparation was packed for use by a man in a nearby city. One year 125 pounds were packed during the first week in October, and the last of the butter was used about the 25th of June. We were assured by this man that the last of the butter was as good as the first. K. C. WIVEL.

THE BROWN SWISS CATTLE.

I NOTICE an inquiry regarding Brown Swiss cattle, the answer to which I wish to correct in some particulars. Ira Inman, Beloit, Wis., is secretary and Wm. B. Hale, Rochester N. Y. is president of the Brown Swiss Association. Prof. Minkler states that no system of registration for production has been adopted. Under separate cover I am sending you a publication showing the records of cows and heifers that have qualified for registration of production, which was adopted about three years ago. This publication was issued about two and a half years after the register for production was established. The 94 cows and heifers named averaged 10805.4 pounds of milk and 431.91 pounds fat. The highest cow was College Bramsa 2nd, 19460.6 pounds milk and 798.16 pounds fat Thirty-nine mature cows averaged 11446.3 pounds milk, 447.91 pounds fat. Sixteen five-year-olds averaged 12087.3 pounds milk, 483.08 pounds fat. Ten two-year-olds averaged 8422.5 pounds milk, 360.59 pounds fat. The highest two-year-old gave 10464.3 pounds milk. The highest butter-fat test for two-year-olds was 454.24 pounds. This would also tend to refute the statement that they are slow maturing. Every cow thus far that has applied for entry, except those that have met death or accident, has qualified, and the average has been higher than that of any other breed.

The showing of the Brown Swiss at the various shows and fairs this year has been very conspicuous and noticeable. In this week's Hoard's Dairyman I notice the following: "Mr. Stevenson, who judged Brown Swiss and Holsteins, made the statement that the Brown Swiss was the finest class of these cattle that he had ever seen. The breeders are giving a smoothness and finish to their cattle that is compelling the attention of the dairy world." This breed has also won the highest honors at the butterfat contests open to all breeds at the Michigan and Illinois State Fairs this year. The Brown Swiss Breeders' Association held its annual meeting this year Oct. 27th in Chicago during the National Dairy Show, at which time they expected to make the finest display of the breed that has ever been seen in this country. W. E. JANES.

New York.

"NO MORE HOG CHOLERA FOR ME I EAT COOKED FOOD"

Just Hog Talk—however hogs don't want cholera, worms or disease—but the health that comes from good, clean, wholesome food. YOU SHOULD GET

THE WHOLE STORY

Every farmer who raises hogs—you—absolutely needs to know the whole story—needs our free booklet "The Undigested Toxines—The Science of Feeding."

It tells the whole truth about raw and cooked foods—how to prevent hog cholera, worms and other diseases in animals—how to keep **hogs, cows, sheep** and **poultry** healthy—new thoughts—old methods—

Saved Him $225.00

For spavin, splint, ringbone, thoropin, for swellings, bruises, bony growths, and lameness, nothing in our opinion has ever proved equal to Kendall's Spavin Cure.

READ THIS LETTER

From E. J. Dayton, Knobley, West Va.

"Two years ago the muscles at the point of my mare's shoulder gave way, and three Veterinarians told me she was ruined, but I used Kendall's Spavin Cure according to instructions and today I have refused $225.00 for that mare. I claim you saved practically the whole amount. I have tried it almost for everything in the animal line and have found it wonderful."

Price $1.00 a bottle or 6 for $5.00. Get our Book, "Treatise on the Horse"—Free at druggists or write us.

Dr. B. J. Kendall, Enosburg Falls, Vermont, U. S. A. 9

OHIO CATTLE MEN ORGAN ZE.

A THOUSAND farmers and breeders can do much for live stock interests in any State. When these interests are so appealing that five times this number will probably join forces in the next few months, the association evidently is handling situations which are vitally important not to one thousand or five thousand members, but to all farmers and stockmen of the State. This is the Ohio Cattle Men's Association. The movement has only been organized within the last six months. It is the opinion of the membership that legislation has been enacted which has overlooked the rights of owners of live stock and has caused them inconvenience and loss. The problem of bovine tuberculosis is one facing the farmers of Ohio. It has been discussed in State meetings for several years. The prominence of the question is making it one of the important matters under consideration by the members who maintain their views in the matter are fair. A prominent member advises the policy of cleaning up of herds, not on the basis of the tuberculin test, but on the basis of evidences of the disease in the excretions of the animals. He says that he is backed by the members and farmers of the State on the basis that all spreaders should be eliminated, while in his opinion, reacters may in no way become dangerous owing to very small evidences of the disease. He maintains in behalf of the members that the movement against the disease may be in this way immediately inaugurated. The tuberculin test is but one of the problems which faces the association. The matter of encouraging systematic and improved breeding operations in the State, the stimulating of coöperative activity among other live stock organizations, and the promotion of the various breeds are purposes of the organization.

The officers are: President, Dr. R. G. Holland, Wellington; vice-president, J. J. Hudson, Ravenna; secretary, W. W. Watson, Youngstown; treasurer, Samuel Werren, North Benton; executive committee, George A. Klotz, Canton; J. S. Miller, Ellsworth; J. W. Scott, Hudson; Wm. Bakody, Youngstown and Charles Norr, Wellington. A meeting is planned for farmers' week at Columbus, Ohio, at which time an election of officers will be held. W. J.

BOSTON MARKETS.

A GENERAL decline of prices due to rather large receipts of most kinds of fruit and produce in Boston has taken place lately, and from all signs is likely to continue for a while. Apples, which were selling fairly well, considering the crop and general condition of trade everywhere, are now practically a glut in the market, and the falling off of export trade from 44,000 barrels three weeks ago to 24,000 barrels two weeks ago and 14,000 barrels last week, has not helped matters a bit. Large quantities of dropped apples, especially Baldwin and Greening, are being put on the market, but find poor sale and bring low prices. The new open-air market opened at Shawmut Ave. and Castle St., a few days ago, is giving the consuming public of the medium and poorer classes a chance to buy apples at a much lower price than they have been paying to the street peddlers, and bids fair to cut quite a figure in market circles by helping out the producer and consumer both, and leaving the middlemen to look on. At this time of year up-country shippers and Boston dealers ship in car lots of drop apples in bulk and shovel them into barrels which are weighed and sold at $1 and $1.25 per barrel to peddlers, who distribute them about the city at a good profit, the general prices being 20 to 30 cents per peck. Now anyone can go to the new market and buy better apples at 40 to 60 cents per box, and the public is doing just this. At the regular market fancy apples are in demand to supply a certain trade. Gravenstein brings up to $3 per barrel, McIntosh about as much; other kinds such as Snow, King, Wolf River, Alexander, etc., about $2 per barrel; Baldwin and Greening about $1.50 in most cases. Western box fruit $1.50 to $2 per box when wanted. Good bananas, yellow, $2 to $3 per bunch; others $1 and $1.50; red $3 to $4.25 for choice, others $1.50 and $2.50. Cranberries slow and prices rule low at $4 per barrel and $1.50 per crate. Grapes plentiful and cheap; California stock of Malaga, Tokay, etc., $1.25 and $1.50 per crate; Delaware, Concord and such kinds in small baskets range from nine to 15 cents each. Grapefruit plenty at $2.50 and $3 per box. Lemons cheap and plenty enough for all wants, prices range from $2.50 to $6 per box. Oranges from California about $4 per box. A large crop of Floridas will soon be in the market at reasonable prices. Pears not in heavy supply, but demand good on all grades; Bosc about $3 per box; Seckel $2.50 and $3; Sheldon $2; Anjou $1.50; cooking stock 75 to $1. Pineapples $3 to $5 per crate. Quince cheaper than usual, $2 per box being the average price for most kinds.

Potatoes rule rather low at present, but may advance slightly later; $1 and $1.10 per bag are the general prices on these; sweets $2.25 per barrel. Southern string beans 75 to $1.50 per bushel basket; Limas $3 per box; cabbage a little short and bring up to $1 per barrel for both drumheads and Savoys; reds 75 per box. Cauliflower 75 per box; celery 75 per dozen for early sorts, with Pascal and Boston Market from $1 to $1.75. Cucumbers $4.50, $3.50 down to $2 per box. Lettuce 50 per box; tomatoes $3 per box for ripe, $1.50 for green. Squash are plenty in the market just now, and price low, with demand just fair; marrow 75 per barrel; turban, Bay State and Holland $1 to $1.50 per barrel or per hundred pounds. Onions very low and quality rules rather poor for present stock of Western Massachusetts, etc.; 75 and $1 per bag is what many of these are sold for; native stock, well dried, 65 to 75 per box and extra large firm stock $1 for the best trade. Turnips, Fall varieties, 75 per box; rutabaga $1 per barrel. Dry weather has shortened all root crops, which are the best property the gardener has this season. Beets 75 per box; carrots 85; parsnips $1; radish 50 and 65; spinach, 50 per box and plenty.

Live hogs and beef lower, the former about eight cents per pound; the latter four to eight cents is general run of the different grades with extra fancy in a few cases up to 10. Dressed hogs, 10 is about the average. Veal calves in demand and slightly higher, 10 to 12 for best, six to eight for poorer grades. Milch cows in slow demand except for a few extras which always are in demand at good prices; the former being $50 to $75 each, the latter $75 to $125. Live hens and chickens 14 to 15 per pound. A. E. P.

BUFFALO MARKETS.

THE apple market has improved lately, so that some extra grades are selling for $1.75 per barrel. Greenings retail in the city at 60 cents a bushel. Potatoes are not quoted at above 48 and retail at 60. The local crop is very large and of fine quality. Peaches are about gone, a few being offered at $1 for a third-bushel basket. Pears are not plenty and the quality is only fair. The price is $4 per barrel wholesale. Grapes are very plenty, home-grown wholesaling at two cents a pound and retailing at three. In car lots the price is $35 per ton. Cabbage is not quoted above $3 per hundred; celery is 30 cents a dozen down; cucumbers are becoming scarce at $1.75 per hamper; lettuce, 20 cents per dozen; tomatoes, 20 to 40 cents per half bushel. String beans are poor at $1.75 per hamper or eight cents per quart, retail. Frost held off a long time and enabled the farmers to market about everything. Market dealers complain that consumers deal with farmers direct and make it hard for them to pay stall rents. If there were half as many of them the business would still go on at full volume and it would be easy to pay rents. There are a few Brussels sprouts, retailing at 25 cents a quart, a high price, and parsnips have appeared at 10 cents per two-quart measure. Hubbard squashes are plenty and very fine, at two cents a pound or less, as the crop is large. There is considerable sweet corn yet, though mostly hard, retailing at 20 cents a dozen. Butter is steady, but quiet, at 34 cents down, wholesale, and cheese 17 cents down. J. W. C.

AILING ANIMALS.

Suspicious Case.

I HAVE a horse which seems to have a very bad cold. She has no cough and her nose seems to be dry when in the barn, but as soon as she travels on the road there is a watery discharge that comes from her nose. Under her jaw she has a little swelling the size of a walnut; the white of her eyes are pink, and the lids are a little swollen. We also discovered a red spot on her tongue. Her appetite is not very good; she refuses to eat oats, but eats hay; we gave her some middlings, and she acted as though very hungry. It seems her throat is sore and it hurts her to swallow. C. D.

Connecticut.

We should not feel justified in prescribing treatment in this case as the symptoms suggest glanders, and that disease is incurable, contagious among horses and communicable and fatal to man. An affected horse has to be destroyed according to State law and the premises quarantined. The stable has to be cleansed, disinfected and whitewashed. It may be some simple ailment, but the only safe plan will be to have an examination made by a local graduate veterinarian. Meanwhile isolate the horse. A. S. A.

Itching Skin.

I HAVE a horse troubled with itching skin. Is there anything that can be done for it? J. M. G.

Pennsylvania.

Chicken lice or horse lice may be the cause of the itchiness. Keep poultry out of the stable. Clip the horse and wash affected parts once daily with a 1-100 solution of coal tar dip. Do not feed corn or green grass in Summer, if the horse has to work. Keep the harness clean. If the itchiness persists mix half an ounce of granular hyposulphite of soda in the feed once daily. A. S. A.

Indigestion.

A CALF now about two months old does not grow. When I first got her I began feeding calf meal, according to directions, kept her in a box stall as the weather was hot and flies bad. Then seeing she was making no progress I tied her outside in the shade. She nibbles a little grass occasionally, but lies down most of the time. Her bowels seem all right, but the manure has a very bad odor. She always has water at hand, but does not appear to drink much. I have raised calves before, but have never had one that would not eat grass most of the time and keep on growing. H. M. B.

New Jersey.

Physic the calf with castor oil in milk, then add one ounce of limewater to each pint of milk fed. Feed six times a day, and allow the calf its liberty on grass, in orchard or a shady place. Spray with a fly repellant daily. See that all feeding utensils are kept scrupulously clean and sweet. A. S. A.

Strong Milk.

I HAVE a Jersey cow that I highly prize; she milks well to within four months of calving, she will then dry up. I could keep her milking longer, but the milk seems strong and thick so much so we dislike to use it. Can you tell me the cause of this, and do you know to how to prevent it? I feed this cow soft feed, cow beets and corn fodder. Would the feed cause the milk to get thick and strong? W. H. W.

New York.

A cow that "dries off" four months before calving is scarcely worth retaining for dairy purposes, but if there is a profitable flow of milk at the time you dry her off on account of the milk being strong in taste, she may be worth treating. The cow beets are a probable cause of the tainted milk. They should be fed after milking, or in this case, it would be well to exclude beets from the ration and if possible substitute corn silage and good mixed clover hay. Great care should be taken to sterilize the milk utensils and to keep the stable free of strong odors which tend to taint warm milk. Everytime the milk becomes strong in taste physic the cow and then mix half an ounce of granular hyposulphite of soda in the feed twice daily. A. S. A.

"You are still taking Summer boarders?" "Yes," replied Farmer Corntossel. "It isn't that we need the money. But we'd get kind of lonesome if a new bunch of city folks didn't come along every week or so an' cut up an' try to entertain us natives."—Washington Star.

The Henyard.

THE EGG-LAYING CONTEST.

THE contest is getting exciting. With only one week more to go Tom Barron's White Wyandottes have gained steadily every week lately, until now they are only six eggs behind Francis F. Lincoln's White Leghorns. As Barron's pen gained 11 eggs over Lincoln's pen this week, the probability is that Barron's White Wyandottes will win this contest. Barron's Wyandottes gained eight eggs on Lincoln's pen last week, and 13 the week before, and 10 the week before that; they are certainly walking up towards the front at a good pace, and stand more than an even chance of winning this contest. In the next contest at Storrs there will be a larger variety of breeds than have ever been entered before, also a larger number of birds. A feature of great interest will be the 30 single birds entered by THE RURAL NEW-YORKER for 30 of its woman readers.

The Rhode Island Reds from Glenview Poultry Farm make the highest score this week viz., 33; Tom Barron's White Wyandottes tie for second place in the week's record, with Dr. N. W. Sanborn's Buff Wyandottes, each pen laying 29. Neale Bros.' White Wyandottes are third, with a score of 28, and Jules F. Francais' pen of Barred Rocks tie with Storrs Agricultural Station pen of White Leghorns, each scoring 25. The total for the week has dropped down to less than 1,000, the record for the week being 969. The total number laid to date is 117,059. This is an average of about 143 eggs per bird, with one more week's output to add to that. This is far above the average laying of outside poultry. The record for the week follows:

	Week	Total

GEO. A. COSGROVE.

A Busy Man's Hen Record.

IN answer to M. M., who asked what profit can be made per hen per year, on page 1244, I will give my record. I do not class myself as one of the big ones, and I have nothing to sell. Record is of 450 S. C. White Leghorns, about one-half pullets, from Sept. 1, 1913 to Sept. 1, 1914.

1913, Sept., 2,811; Oct., 897; Nov., 1,292; Dec., 1,754; 1914, Jan., 920; Feb., 3,186; Mar., 6,372; Apr., 8,312; May, 8,522; June, 7,232; July, 6,960; Aug., 5,838. Total eggs, 54,096—4,508 dozen. Averagae price, per doz., 28 cents.

Total amt. received from eggs	$1,262.24
Poultry sold during the year..	171.17
Increase of 100 pullets.....	100.00
Total receipts	$1,533.41
Paid for feed	750.00

Average eggs per hen, 120.

The feed includes all fed to young chicks as well as the hens. My hens are kept in their houses from Oct. 1 to Apr. 1, when they are let out every afternoon. My houses are not more than large sheds; nothing in front, but wire and a bran sack curtain which I drop to keep out snow, and when the thermometer gets below zero. All shelled grain is fed in deep litter nights only, composed of good oats and cracked corn. In the morning they are fed all the dry mash they can clean up before feeding time at night, composed of 200 pounds mixed feed, 100 pounds middlings, 100 pounds cornmeal, 100 pounds gluten, 100 pounds meat scrap. For green feed they have all the cabbage they can eat from Fall until Spring. Fresh water is before them at all times. My egg yield in the Winter was the poorest it ever was because I had not prepared for the blowing snow which piled in and soaked the litter. The pullets and hens were kept separate, but the records together. This record includes all broken ones and those used in the house, also for setting, but not the birds eaten in the home. The eggs were all sold in the local market to one man. Eggs were wiped clean and put up well. I have sold my eggs for a flat price of 33 cents a dozen for the year commencing January 1, 1915, excepting what I may use or sell for setting. I would like to hear from others and would be glad of any criticism one might offer. I run in connection with my hens a dairy of 20 cows, also have some fruit; have a farm of 132 acres. I do the work with the help of one good man and have time to go to church twice on Sunday.

H. B. SMITH.

Dutchess Co., New York.

Making Hens Pay.

WOULD you advise me how to make a flock of hens pay? My sister has a large flock consisting of Barred Plymouth Rocks, pure strain, and Rhode Island Reds. She is getting two dozen eggs a day and with the price of grain way up she finds it rather a serious matter. The hens have plenty of room and shade, and a good new building. She has to buy everything they eat, as she raises nothing. MRS. E. F.

New Hampshire.

There are so many things to be considered in the effort to make a flock of hens profitable that it is utterly impossible to include them all in this reply. The most practical suggestion that I can make is that the poultry columns of this, and other, papers be read regularly and that such methods of feeding, breeding, housing and general care as seem sensible and can be adapted to one's conditions be adopted. It is neither practicable nor wise to attempt to follow all the ideas one finds in print but the general practice of successful poultrymen may be learned from reading and practical experience with a flock will enable one to sift the wheat from the chaff of the advice that is tendered. If feeding is your problem, tell the methods that you are now following and the kinds of feeds that are available to you in your market; the most economical and efficient way to use these in securing a satisfactory egg production can then be considered. M. B. D.

Leghorn Feathers for Pillows.

HAVING dry-picked quite a few broilers, White Leghorns, I proposed using the fluffy feathers for pillows, but was told they were unhealthy for this, causing various ills. Have you used these feathers for any such purpose and with what results? E. H.

New York.

There seems to be a prevailing notion that chicken feathers are injurious to health in some way when used in beds or pillows but that there is any foundation for this opinion the writer does not believe. Feathers of any kind used for this purpose should, of course, be perfectly clean and those from hens are inferior to geese feathers. M. B. D.

Medicated Eggs.

DO you think medicated eggs are any good to put into nest to kill lice? A. R.

I have never seen any medicated eggs that were of value in destroying hen lice, and do not see how any could be prepared. They would not necessarily come in contact with the lice on a hen's body and I doubt if any substance giving off fumes of sufficient intensity to destroy lice would be accepted by the ordinary hen as a proper tenant of her nest. M. B. D.

Ailing Hens.

WHAT is the trouble with my White Leghorns? I have some with purple combs; gave each of the sick ones liver pill, but it did not do any good. Chickens have free range of 30 acres. I gave one of them a teaspoonful of castor oil and it died in a little while. F. W. M.

Purple combs alone are not significant of any particular disorder as they accompany various diseases of fowls. It is necessary to have a detailed description of the conditions and symptoms present before any diagnosis as to the probable disorder can be made. Few people are accustomed to making careful observations in the case of sick animals and it is frequently difficult to get a clue to the trouble present from their description. We make the effort, however, and hope, usually, with success. M. B. D.

Buckwheat for Hens; Apples for Pigs.

WOULD it be advisable to feed buckwheat in straw for litter and scratch feed in Winter? What other grains, including buckwheat, are needed for a balanced ration and in what proportion? Which do you consider better to feed growing shotes, cooked or raw apples? What grain and the proportion would you feed with the apples?

New York. W. V. O.

1. The only objection to feeding unthrashed buckwheat is the difficulty in knowing how much the fowls are given. Buckwheat is one of the best grain foods for Winter use and should not be given exclusively. A good grain mixture for scratch feed is corn 60 pounds, wheat 60 pounds, oats 30 pounds, buckwheat 30 pounds. A mash, either wet or dry, containing meat food of some kind, should be given in addition.

2. Apples are usually fed raw; there would probably be no gain in cooking that would justify the added expense. They are a succulent food of some value, but do not contain the nutrients needed by growing stock. Wheat bran, middlings, cornmeal, barley, ground oats should form the basis of the ration, given with skim-milk or water as slops, and apples in such quantities as they will readily eat may be added. Growing pigs should have pasture if they are to be economically raised. M. B. D.

Small Poultry Plant.

I EXPECT to be interested in a small poultry plant for about 100 hens. Will you give me an idea of plan that would be suitable for such, and which would include place for storing food, etc.

Canada. F. R.

One hundred hens will not require very extensive buildings or grounds for their care. If a new building is to be put up, it should have, at least, 300 square feet of floor space for the fowls, and as large a storeroom as is desired for feed. The larger the run that the fowls can have in connection with this the better. The more nearly square a building, the less material required for the walls, and the greater the depth, up to eighteen or twenty feet, the better. A building 16x20 feet in size would, perhaps, be about the minimum in the way of space requirements. It should have a sufficiently open front, guarded by curtains in your latitude, for ventilation and glass enough in the eastern and southern exposures to admit what sunlight is available to the building. The general style of the building and the material for its construction may safely be left to your taste and pocketbook. M. B. D.

FARMER CLAPOLE: "Has that city feller who bought Stone's farm learned anythin' yit?" Farmer Sands: "Wall, he's larnt it don't do no good ter try ter make apple butter in a churn."—Judge.

The Truth About Poultry

Get the Facts by Reading The One-Man Poultry Plant

Successful Methods of Men on Farms or Small Acreage Complete in twelve parts; printed in one volume.

By DR. N. W. SANBORN

REAL work, with real poultry, on a real New England Farm. This is a simple story of what has been done by a man, at forty-five years of age, town bred and city educated, getting out of practice of medicine, buying a small farm in the hill country, and making a success of the venture. Not only is the rearing of chicks and the management of adult fowl completely covered, but the interesting side issues of fruit growing, grain raising and the production of milk, that cannot be escaped on a real farm. You get rugged facts—rarely found in print. The truth about poultry as found in actual life on a one-man poultry farm.

You Can Do the Same, Book Tells How

OUR SPECIAL OFFER—The One-Man Poultry Plant, in twelve parts (book form), and the American Poultry Advocate, one year, for only 50cts., book and Advocate, three years, for only $1.00, if order is sent at once.

Our paper is handsomely illustrated, practical, progressive and up-to-date on poultry matters. Established 1892. 44 to 132 pages monthly. 50 cents a year. 3 months' trial 10 cents. Sample copy free. Catalogue of poultry literature free. Address

Farm-Raised Pheasants.

CAN I raise pheasants on the farm with hens, the same as turkeys? Would they stay around or would they wander away? H. H. M.
Carmel, N. Y.

So far as the actual raising of the pheasants is concerned there is no great difficulty in getting good results, and they usually stay around until the neighbors or "friends from the city" shoot them. I have heard of a number of cases near here where as good hatches were made and as many birds raised as would be likely to be the case with Leghorn chickens. The greatest difficulty is with the game law. In order to be permitted to raise pheasants, whether you let them wander off from your land or not, it is necessary: (1) to be sure that the entire boundary of your farm is marked in some way. (2) To post notices at each corner and not more than 40 rods apart between corners stating that this farm is established as a private game preserve. (3) To publish this information once a week for four weeks in some paper printed in the county where the farm is situated. (4) To pay five dollars annually for a license, which will be issued when the Conservation Commission has been satisfied that the application has been made in good faith.
Wayne County, N. Y. A. C. W.

Pullets Eating Feathers.

I HAVE about 24 pullets in my back yard; as soon as one drops a feather there will be another right there eating it. They look well and healthy. Is this bad for the hens and what is the cause of their eating feathers? They get grit, charcoal, beef scrap, bone meal in mash and lots of green food. G. B.
New York.

Feather eating is a habit likely to be acquired by chickens that are closely confined and perhaps have some cravings for unnatural foods that would be satisfied by the hundred and one things that they pick up when they have their liberty. If you can spade up the soil in some place and let them dig in it, and then give them all the liberty possible, they will probably not suffer any ill effects from what feathers they eat, but the practice should not be encouraged. M. B. D.

Arrangement of Henhouse Windows.

IN my poultry house, with opening about 5x8 feet, house 15½ feet square, if curtain is not closed when we have southerly rains litter gets wet and fowls have colds. How would it do if the opening had sash arranged at an angle to keep out rain? Would it be sufficient for 55 to 70 birds? A. F. L.
New York.

Your plan should prove satisfactory if you did not yield to the temptation to keep the windows closed too much of the time. An awning or other protection for the opening would be cheaper than sash and, perhaps, fully as satisfactory. The method of ventilating a henhouse is of less importance than the thoroughness with which it is done, remembering, however, that fowls should not be exposed to direct drafts. This building should house 75 fowls. M. B. D.

Buff Orpingtons.

WILL you give me information concerning Buff Orpington hens and tell me the best method of feeding them? A. W.
Dover, N. H.

Replying to A. W.'s inquiry about Buff Orpington hens, would say that I kept that breed for a while and liked them very well. For table poultry I never saw anything better, and for laying in cold weather they equalled the best of my White Wyandottes. At the Storrs contest last year, if I remember right, one of Mr. O. Wilson's Buff Orpington pullets laid the most eggs of any hen in the contest. As to feeding them, the only thing to look out for is to see that they do not become too fat. They take on fat very easily, therefore a smaller proportion of cracked corn in the grain feed, and of cornmeal in the dry mash should be used than if one were feeding Leghorns for instance.

A good dry mash would be three parts wheat bran, two parts middlings, one part cornmeal by weight, with one-half part of beef scrap added. If gluten and ground oats can be had, add one part of each. For the grain feed use equal parts of wheat, oats and cracked corn. Mr. Barron uses also Kaffir corn and barley, thinking the larger variety the feed the better. How to feed is almost of as much importance as what to feed, but this can be best learned by experience. Mr. Barron feeds dry grain in the litter in the morning, a little more at noon, then a full feed about 4 p. m. of boiled oats, sometimes with cooked vegetables in it, the whole dried off into a crumbly mash by stirring in a mixture of ground grain, bran, middlings and meal. But experience only can teach a person how to be a good feeder. GEO. A. COSGROVE.

Chicken Pox.

I HAVE a flock of White Wyandottes and Light Brahma pullets and cockerels, five months old. The birds were healthy and thriving until about two weeks ago, when I noticed sores appear on their combs, wattles and evelids. On several, only the eyes are affected, no sores being visible, only a white foam in the corners of the eyes. The sores vary in size, the largest being about the size of a pea. They are yellow and pink in color, and do not open unless the chickens pick or scratch them. The birds affected worst, have also diarrhœa. I feed a wet mash of cornmeal, middlings and ground oats in the morning, and wheat and corn at noon and evening. The coop is in sanitary condition, also the runs, both being new and used for the first time. What can I do for them? The disease is spreading rapidly. I have already separated the healthy fowls.
New York. F. H.

This eruption is very likely that of chicken pox and is very contagious, but, in Northern States, not apt to be fatal. The sick fowls should be isolated and the eruption painted with tincture of iodine; the utensils should be disinfected with boiling water and it would be well to whitewash the interior of their quarters, even though new. With care the trouble should be eradicated. M. B. D.

Cross-breeding Fowls.

IS it advisable to mate R. C. Rhode Island Reds with S. C. Red cockerel? Do you think it of any benefit to mate a mongrel Brown Leghorn, a good layer, with a White Leghorn cockerel? D. D.
Pennsylvania.

There is nothing to be gained by crossing the Rose and Single Comb varieties of the different breeds, and a little something in the way of purity of strain is lost. There is no serious objection to it, however, if one wishes only a utility flock. The same statements apply to crossing the different colored varieties of the same breed; the result is a mongrel flock of many colors but not necessarily inferior as layers. M. B. D.

Limberneck.

MY poultry have limberneck; this is the fourth year. I have tried different remedies but they still have it. They get slimy in the mouth, and their feathers fall out. L. B.
Delaware.

If your fowls have true "limberneck" caused by eating decayed and poisonous food they should be treated by administering a cathartic, such as one to two teaspoonfuls of castor oil, and preventing their access to such food. This does not cause feathers to fall out, however, and it is possible that your fowls are afflicted with depluming mite, which burrows into the skin at the base of the feathers and causes their loss over the affected areas. These mites may be destroyed by rubbing in grease of some kind, like lard or vaseline with the addition of a little kerosene. Without a more complete description of the trouble with your fowls and your methods of care, I cannot be at all sure of the cause of their ill health or of the measures that need to be taken to overcome their indisposition. M. B. D.

Thermostat for Incubator.

COULD you give me any information in regard to the construction of the heat regulator for incubators, of the disk type, and what the fluid is that they contain? R. H.
Schenectady, N. Y.

Wafer thermostats of the disk type are made of thin sheet metal in hollow form, and are filled with a volatile fluid which by its expansion and contraction under varying degrees of heat moves the regulating bar of the machine. I do not know what fluids are used by the manufacturers, but presume that any volatile liquid like ether or bisulphide of carbon would answer the purpose. These disks may be purchased from the incubator manufacturers whose advertisements you will find in the agricultural and poultry journals. Disk thermostats, while sensitive, are comparatively short-lived, and the better grade of machines usually use the zinc and steel bar thermostats; these also may be purchased alone and used in any machine. M. B. D.

COMING FARMERS' MEETINGS.

American Association of Farm Institute Workers, nineteenth annual meeting, Raleigh Hotel, Washington, D. C., Nov. 9-11.

PUBLISHER'S DESK

FREQUENTLY we hear from old friends who say they read the first issue of THE R. N.-Y., and have subscribed for it regularly ever since, with possibly a lapse of a few years in some cases. The cycle of time is making inroads in the ranks of these old friends, but some of them are yet with us and we feel for them sentiments of gratitude and friendship. Just at this time we are particularly interested in locating these old friends. We would like to hear from subscribers or from surviving wives of subscribers who remember the first issue of THE R. N.-Y. and are yet receiving the paper. We have something in mind which we believe will please them and their friends.

John Kearn, 35 years old, of 504 West 145th Street, New York, has an imagination, if not a profound practical knowledge, of the pig industry. His theory is that:

One sow will bear two litters of pigs a year.
Each litter will number six pigs.
Each pig is worth $10.

Income $120 a year from each sow. This you can multiply as often as you like by the simple process of increasing the number of sows. On this theory Mr. Kearny organized the Eastern Pig Company, with offices at 2 Columbus Circle, where land is worth $200 a square foot, and office space costs $3 per foot per year.

Aaron Dettel seemed to have been the first customer, and was hired to drive around town with a pig, properly placarded to convince the public of their independence of Wall Street, provided they made prompt use of their opportunities. The paper stock was to be sold at par; and the four-legged species at $50 apiece. Dettel and several other credulous investors put up their cash; but when Dettel applied for his week's salary he found the office closed. He and the other investors then caused the arrest of Kearn and his 17-year-old wife, who acted as stenographer, and the judge held them in $3,000 bail.

Some of our city papers would give the impression that gold bricks find a ready market only in the country and every victim is classed as a "rube." It will be hard to convince some farmers that the above story is not a joke; but we assure them that we repeat a solemn serious court record of the City of New York. Evidently some city subjects know no more about pigs than farmers know of green goods. You will notice that every time a person shows up as a victim of one of these schemes, he confesses that he was misled by the promise of big profits or quick riches.

On June 15, 1913, I sent check for $6 to the National Correspondence Institute, Washington, D. C., as enrollment fee for preparation for examination as postmaster at fourth class office, this examination to be taken by the assistant postmaster, as I was past the age limit. The assistant postmaster afterward decided that he would not take the examination and the office was not listed for same. I wrote this party to refund the enrollment fee, but they refused to do so. I then placed it in the hands of a collection agency but with no better results. While this may not get me my money I may save some one else.
Pennsylvania. M. T. R. B.

The complaint in this case seems to be that no service having been received the fee should have been refunded. The demand seems fair and equitable; but fees of the kind are not always returned in such instances by schools of unquestionable standing. In all such cases it is best to stipulate in advance that the fee would be returned in case it was found necessary to change plans.

E. B. Dennison, formerly a lawyer in New York City, has been convicted on a charge of extortion in Grant's Pass, Ore. Dennison was the main witness in the State's case against Oslin M. and Edgar R. Jackson, formerly of the Jackson Brothers Realty Company, of 507 Fifth Ave., indicted for alleged real estate swindles three years ago. Soon after the indictment Oslin Jackson went to Oregon. He is still wanted by the New York authorities. Dennison, learning that Jackson was in Grant's Pass, followed him there, and his efforts, it is said, to realize from Jackson on a Judgment obtained in the New York courts resulted in his conviction on a charge of extortion. Edgar R. Jackson, Oslin's brother, was convicted two years ago, and obtained a new trial by the Appellate Division. He is now out on bail. —Tribune.

THE R. N.-Y. readers will remember the Jackson Brothers and their realty schemes. Schemers never give up their trade; but it is important to credulous people that they follow the developments. When they escape the law in one place they proceed to new ventures.

The North American Art Studio people claim they come from Syracuse, N. Y. I have written them there, but can hear nothing. They stopped around here a year ago and were enlarging pictures while on their vacation. They took in a number of nearby towns. They brought the proofs and gave 10% off to all who paid in advance, but after paying in advance, we never saw anything of them or of the pictures either. I thought perhaps some of your readers could let us know something about them. A. H. D.
Vermont.

Complaints of this kind are numerous. No one should pay money or give up photographs to these itinerant agents unless it is shown that they represent responsible houses. We have been unable to locate this particular concern. It is probably a name assumed by the agents for the time being.

I sent $10 to the Continental Cigar Company, Beacon Bldg., Wichita, Kansas, on May 10, 1914. In a few days I got a statement that they had been arrested for doing an illegal business and they could not send the sample cigars as agreed, but would return the $10 as soon as the suit was settled. I wish you would look them up and see what you can do to get my $10. I wish to join your club to expose fraud. J. L.
New York.

An experience of this kind shows the advisability of being cautious about giving orders to itinerant agents. We endeavored to get in touch with the company, but mail addressed to them is returned marked "Fraudulent," and the $10 will have to be charged to experience. The subscriber is one of the charter members of the Anti-Fake Club.

I bought, through the Mutual Mining and Reduction Co. of Philadelphia, Pa., three years ago, 800 shares of gold mining stock valued at $1 each, for $400. Property is located in New York State, Lewis County, 250 acres land, sand formation, and as I have found out that the mine has not been running for over a year and the offices closed, I tried to sell it. Is there any chance for me to get back my $400, hard-earned money, for which I have been working over four years at 16 hours a day, by claiming a part of acreage or otherwise?
New York. G. R. F.

It is doubtful if you could sell the stock for the cost of the blank paper on which it is printed. The great majority of the mining companies are not organized to dig metal out of the ground, but as an excuse to sell the stock to just such credulous purchasers. This stock never had any value, and G. R. T. might just as well have burned his four years' saving as to give it to these promoters. In a few weeks now we hope to have a place where these frugal people may invest their savings and get the benefits of the earning power of the money. The Land Bank securities will save millions to such people annually, provided they use it. But neither the Land Bank, nor any other sound institution, will promise quick riches. It is too bad that our frugal people are so often robbed of their savings; but they must learn to be suspicious of promises of big profits, and seek safe investments for their savings.

Enclosed you will please find a two dollar bill for a two years' subscription to THE RURAL NEW-YORKER, as my subscription expires about this time. The longer I get the paper the better I like it, and especially the way you expose fakes and frauds. I also enclose a slip that was left here at our place some time ago, according to your book "Hindsights." It is that old "soap fraud" game that was being worked through this section. He offered to give china closets, etc., as premiums, but they never showed up. As soon as I saw the circular and heard of his wonderful premiums it reminded me of "Hindsights," and I looked it up at once and found it to be about the same thing as the "soap fraud." I wish your paper success, and also your "Publisher's Desk" department. S. H.
Pennsylvania.

It is some satisfaction to know that we are heading off the fakers among our own people at least. It is always well to beware of big promises. These soap schemers make collections in advance on the promise of big premiums to follow, but the premiums do not come.

J. J. D.

Flavor——
do you bring it out—
or kill it?

WHEN used for curing meat pure Worcester Salt makes the "flavor-compelling" brine.

It stays clear-as-crystal and is free from the scum and "ropiness" you get with ordinary salt. Meat packers whose brands are famous for "flavor" use nothing but Worcester Salt. Get that flavor yourself. Use

WORCESTER SALT
The Salt with the Savor

Worcester Salt is best for butter mixing because its fine, even crystals dissolve at once. Its sweetness makes for fine flavor.

For farm and dairy use, Worcester Salt is put up in 14 lb. muslin bags and in 28 and 56 lb. Irish linen bags. Get a bag from your grocer.

Write for booklet "Curing Meats on the Farm." Sent free on request.

WORCESTER SALT CO.
Largest Producers of High Grade Salt in the World

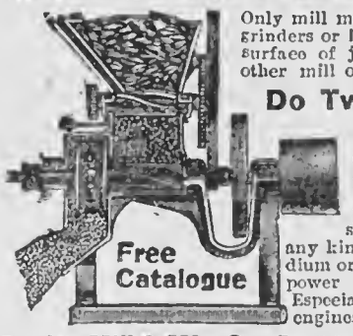
West Bend BARN EQUIPMENT

KELLY DUPLEX GRINDING MILLS



Only mill made with a double set of grinders or burrs. Have a grinding surface of just double that of any other mill of equal size, therefore,
Do Twice as Much Work.
Grind ear corn, shelled corn, oats, rye, wheat, barley, kaffir corn, cotton seed, corn in shucks, sheaf oats, or any kind of grain, coarse, medium or fine. Require 25% less power than any other mill. Especially adapted for gasoline engines. Write for new catalog.
Duplex Mill & Mfg. Co., Box 320 Springfield, Ohio

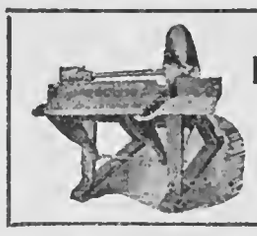
EAR CORN
WHEAT OATS
Increase the value of every crop you harvest by grinding it fine or coarse before feeding it to your stock. Save time, labor, fuel, money and get better results with
SUPERIOR FEED GRINDERS
Simple, powerful, efficient, durable and economical. Double grinding rings. Automatic Force Feed prevents choking. Self sharpening. Money back guarantee with every mill. Write today for Free Catalog and samples.
Superior Mfg. & Mill Company
5 East St. Springfield, O.
SMALL GRAIN

Grinds Oat Hulls at One Grinding
Fine enough to feed swine. No other grinder at the price does this. Also grinds ear corn, screenings, seeds, hay, alfalfa, Kaffir corn, grain. 1 set buhrs grind 1000-3000 bushels.

LETZ FEED MILL
Self-Sharpening Silent-Buhr
10 days free trial to show you that the Letz grinds more feed—better—on less gas than other mills. State H.P. of engine.
Letz Mfg. Co., 213 East Road, Crown Point, Ind.

Save 1/4 On Feed
Practical farmers and stock raisers know the value of the corn ground with the cob. Fatten your stock quicker and at less cost by using the
New Holland Feed Mill
It grinds cob corn, shelled grain and table meal perfectly. Simple in construction—easily operated. All troublesome parts eliminated. An examination will prove to you its many superior qualities. Real money-makers for the farmer. Write for low prices and free trial offer today.

NEW HOLLAND MACHINE CO.
Box 41, New Holland, Pa.



Wood Saws From $10 Up
Several sizes, all strongly built, adjustable bearings on Mandrel.
Write for Cuts and Prices.
Lewistown Foundry & Machine Company, Lewistown, Pa.

New Holland Wood Saws will cross-cut heavy pole and cord wood and rip posts and light lumber. Our patent rock shaft prevents saw breakage and assures easy running. Sturdy and rigid. Beautifully finished. Write today for catalogue, low prices and free trial offer.

NEW HOLLAND MACHINE CO., Box 41, New Holland, Pa.

9½ CORDS IN 10 HOURS

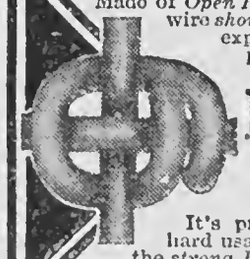
BY ONE MAN. Proven by sworn witnesses. It's KING OF THE WOODS. SAVES MONEY and BACKACHE. SPRING PRESSURE and GUIDE, on end of saw, a BIG 1915 IMPROVEMENT. Send for free catalog O68 showing LATEST IMPROVEMENTS. First order gets agency.
Folding Sawing Mach. Co., 161 W. Harrison St., Chicago, Ill.

$10,000.00
BACKS THIS SAW. IT IS THE BEST AND CHEAPEST SAW MADE.
As low as $10

HERTZLER & ZOOK Portable Wood SAW
is easy to operate. Only $10 saw made to which ripping table can be added. Guaranteed 1 year. Money refunded if not satisfactory. Send for catalog.
Hertzler & Zook Co.
Box 3, Belleville, Pa.

BROWN FENCE
WE PAY FREIGHT
13 Cents Per Rod Up
Strongest, heaviest wire. Double galvanized. Outlasts others nearly 2 to 1. Low prices direct from factory. Over 150 styles for every purpose—hog, sheep, poultry, rabbit, horse, cattle. Also lawn fence and gates of all styles. Mail postal for catalog and sample to test and compare with others. Address
THE BROWN FENCE & WIRE CO.
Department 59 Cleveland, Ohio

All Big Wires—
Made of *Open Hearth Steel*, galvanized as fence wire *should be* galvanized. Our *Free Book* explains the No 9 Empire and Empire, Jr., and tells *how* to *judge wire fences*. Get *facts* about



EMPIRE Fence
It's proof against weather, rust and hard usage. Empire fence *never* sags—the *strong Empire knot* is your protection. Write for Free Book; also ask for special low price. BOND STEEL POST CO.
23 Maumee Street Adrian, Michigan

The American Leghorns Win.

A telegram from the egg-laying contest at Storrs, Conn., received as we go to press, states that Francis F. Lincoln's White Leghorns have won the contest by three eggs, over Tom Barron's White Wyandottes, the record being 2,088 to 2,085. Full particulars will be given next week.

Products, Prices and Trade.

Wholesale Prices at New York.

Week Ending Oct. 30, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with October is as follows. This is per 100 pounds in the 26-cent zone. This is what is known as the "maximum" for milk testing 3.8 to 4.2 per cent. fat, and is 20 cents per 100 pounds above the "flat" rate.

	1914.
October	$2.00
November	2.10
December	2.10
January	2.05
February	1.95
March	1.90

Wholesale prices paid by New York dealers are running $1.91 and $1.81 for B and C. Hotels and restaurants using two to three cans per day are paying five to six cents per quart, single quart prices from bakeries and grocery stores, six to seven cents; delivered milk, nine to 10 cents.

BUTTER.

The better grades of fresh creamery have advanced one cent, qualities scoring 92 or above being scarce. Large quantities scoring 83 to 87 points have sold at 25 to 28 cents. There has been considerable movement of storage.

Creamery, extra, above 92 score, lb	33½	@	34

Poor to fair	7	@	10

EGGS.

The top price on fancy white covers but a small amount of business, but this grade is so scarce at present that buyers who are not limited as to price can handle most of the receipts. Others who are usually in market for top grades are now taking brown and mixed colors at 40 cents or under. Cracked and dirty eggs are in good demand at 14 to 20 cents.

FRESH FRUITS.

The apple market is in better condition, many well graded lots selling 25 to 50 cents per barrel higher. Kieffer pears lower; Seckel, Anjou and other high grades unchanged. Grapes very plentiful and market generally weak except on some special brands of Western N. Y. pack. Cranberry market very dull.

*

Shipment of 288 carloads—about 9,000,000 pounds of flour—is being made to Holland from New Orleans.

*

Tulsa County, in Northeastern Oklahoma, has sown 50,000,000 acres in wheat this Fall, more than double the last harvest acreage.

*

When the Federal reserve banks are opened, some time during November, an additional sum of $580,000,000 will be available for circulation. The new law permits National banks to reduce their reserve from 25 to 18 per cent. of their deposits. The 12 reserve are supposed to care for emergencies, so that there will be no need for the National banks to hoard large sums. The Federal reserve banks must hold in gold or lawful money not less than 35 per cent. of their deposits.

*

California products this year will exceed $120,000,000 in value. Citrus fruits make the largest item $33,0000,000. Other large sums in order are: Barley, $20,000,000; beet sugar, $16,000,000; wine, $15,000,000; grapes, $6,900,000; Lima beans and muskmelons, each, $5,000,000; raisins, $4,800,000; walnuts, $3,500,000; olive oil and cotton, each, $3,000,000.

*

One of Spain's most valuable crops is the orange. The European demand is so poor this year that large quantities of Spanish oranges are expected to be marketed in the United States. Oranges are being largely planted in Australia, and it is expected that many will be marketed here via Panama Canal.

*

New York's exports thus far this year have been valued at $723,000,000, which is about $120,000,000 less than our imports. Our exports are rapidly increasing, as Germany is now getting large quantities of our products, through neutral countries. As Great Britain has declared cotton not liable to seizure as contraband it is expected that heavy shipments will be made to Germany.

*

Usually Western New York puts up large quantities of apples in gallon cans for bakers' use. This year the canned apple market is so poor that the pack will apparently be much lessened. The present price offered at New York, $2 to $2.15 per dozen, delivered at New York, are said by canners to give less than 25 cents per dozen profit.

"I NOTICE your little boy reads the war news assiduously. I am glad to see him taking such an intelligent interest in current events." "His interest is purely selfish. His teacher is marooned abroad."—Louisville Courier-Journal.

Subscribers' Exchange

ALFALFA HAY—F. P. ERKENBECK, Fayetteville, N. Y.

MAPLE COVE FARM—Products direct to Consumers. ROUTE 24, Athens, Pa.

NEW HONEY—Basswood or clover in sixty-pound cans; write for prices. C. A. HATCH, Richland Center, Wis.

APPLES, APPLES, APPLES—For choice sprayed Winter Apples. Please order to-day. C. J. YODER, Grantsville, Md.

ALFALFA FOR SALE—Fifty tons first cutting, thirty tons of second cutting, all cut early, well cured, bright and pea green; have sold farm and must dispose of Alfalfa. JOHN McLENNAN, Fayetteville, N. Y.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

WANTED—Farm board for work. B. ANDREWS, Teachers' College, New York.

SINGLE middle-aged man wishes position to help on farm, wages no object. J. S. P., care R. N.-Y.

EXPERIENCED young man, 19, desires work on farm; good references. C. MICHEL, 113 West 111th st.

A LADY—Practical and efficient, wishes a position in a home of refinement. Address O. B., R. N.-Y. New York City.

YOUNG MARRIED MAN wants position on farm, one year's experience; good house, fair wages. Address B., care R. N.-Y.

PRACTICAL experienced man desires position as superintendent of large estate, decease of employer reason for change. Box 141, Redford, Mass.

A CORNELL GRADUATE, with an experience of 25 years in making fine butter, desires a situation. C. F. LANE, Oneida, care Hotel Oneida, N. Y.

COMMON SENSE experienced manager wishes position; salary or shares; married; Cornell training; references. LESTER HAYES, St. Johnsville, N. Y.

MAN AND WIFE (no children)—Man for farm work and stock, wife cook and downstairs work; state wages, experience and wages desired. GREENFIELD FARMS, Center Square, Pa.

PARTNER WANTED—Florida live-stock proposition, with capital, by university trained agriculturist; 500 acres rich clay soil, near Tallahassee. L. HEIMBURGER, Tallahassee, Fla.

FARM MANAGER—Would like position to manage anything in the line of agriculture, competent and up-to-date; can give best of reference. MANAGER, care R. N.-Y., 333 West 30th Street, New York.

WANTED—Partner, worker to put $1,000 additional working capital in high-class poultry, truck and fruit farm; 25 acres in wealthy suburb of New York City; home market for everything; high prices; big opportunity for experienced hustler take full charge and half profits. N. A. F., care R. N.-Y.

POSITION WANTED—By working farm foreman, not afraid of hard work, who understands farm, garden, poultry, cattle, with ability to make good; at present employed; would like a change; Scotch, aged 39 years, married, no children. SCOTCHMAN, care A. E. Wheeler, 166 West 23d St., N. Y. C.

GOOD STEADY POSITON for reliable, competent man and wife, no children, American or Scotch. To take charge of private stable (3 horses, carriages and equipment), care of lawn and border beds and shrubs, do chores about house, good disposition, no dissipation, willing to be called upon, when necessary to do, or assist on any odd job about the premises; wife to do family laundry; $40 a month and cottage with modern conveniences rent free; only short distance from N. Y. City, West Shore R. R. W. H. PITKIN, Cougers, Rockland Co., N. Y.

A FIRST CLASS family hotel in New York City wants to make arrangements for weekly shipments of butter direct from creamery, to take about 1,000 pounds a month. Financial reference furnished. State terms in tubs delivered New York. Address BUTTER SUPPLY, care THE R. N.-Y.

BOXES AND CRATES quick on new and repairs young man, reliable, strictly sober, now employed as working foreman with New York builder, about to be laid off for Winter season, wants position; no objection to doing other light carpenter work; has tools; $30 per month and board. References. Address R. F. C., care Rural New-Yorker.

WILL pay cash for equipped poultry fruit farm. P. L., Rural New-Yorker.

BEAUTIFUL, rich farm cheap; investigate. VIERS, Huntingdon, Tenn.

FOR SALE—Fully equipped poultry plant in San Jonquin Valley, Calif.; particulars free. O. C., care R. N.-Y.

WANT—Small farm about 35 miles from N. Y., suitable for truck gardening. H. HOOS, 1950 Boulevard, Jersey City.

BERRY, TRUCK and Poultry Farm, 15 acres loam, good buildings, spring water, State road. Box 225, Sidney, N. Y.

FOR SALE—Two Parsons low down milk cans, used but short time. HENRY T. FAY, 236 Main Street, Poughkeepsie, N. Y.

BARGAIN—1,800 acres, $12.50 acre; suitable dairy, stock, grain; serviceable improvements; sell or trade. R 2, Box 108, Cartersville, Va.

FOR SALE—150-acre farm, good buildings, good water, on R. F. D., easy terms. BENJ. LEHMAN, Sharon Springs, Schoharie Co., N. Y.

FOR SALE—Small place, Sullivan Co., N. Y., over two acres; good buildings; adapted for chickens and truck. JOSEPH ROGERS, Farmingdale, New Jersey.

FOR SALE—Farm 85 acres, 65 wide, cultivation apple and peach orchards, one-half mile of depot and town of 1,000 inhabitants; bargain to quick purchaser. HANSON S. PHILLIPS, Hebron, Md.

POULTRY FARM FOR SALE—Paying good profits, fifty acres, beautiful home, ¼ mile from depot, 6 miles large city; 1,000 layers; broods 3,500; $10,000; $6,000 cash. Address POULTRY, Rural New-Yorker.

FOR SALE—Dairy Equipment; small bottling plant; bottle washer, sterilizing oven, can washer, bottler, wooden bottling cases and metal delivery cases. All in good condition. HENRY T. FAY, 236 Main Street, Poughkeepsie, N. Y.

FOR SALE—200 acres dairy, fruit and vegetable farm, one mile from City Hall, sidewalk and electric light to the farm; a good paying proposition or would make an ideal summer resort for city people; full description and price. Address OWNER, Box 277, Montpelier, Vt.

Rush Your Order or You May Be Too Late! Write Today!

None of these goods were made to sell by mail. They were designed for sale through high-priced city dealers. But these 7 big manufacturers made a few more goods than they could sell before inventory, through their regular trade. We had an opportunity to buy them up at cost of manufacture. And we offer them to you for quick purchase, at just 4 per cent over the net cost to us. You will not find them in our big catalog, because the quantity of goods which we could buy in each case was too small. Order direct from this advertisement and save at least 50 cents on every $1. Inspect the goods at your depot and return them at our expense if not satisfactory. You take no risk. But you must order quick or they will all be gone. Never have we seen such bargains. And every article is guaranteed to be exactly as represented. Here's your only chance to get these goods at prices 50 per cent lower than they ever sold for before.

2500 Rolls of Rubber Roofing Guaranteed Five Years Per Roll 83c

Never before has this high-grade rubber roofing been sold through the mail. Our prices are positively the lowest ever known on strictly high-grade roofing. Guaranteed to resist heat, cold, acid or fire; easy to lay as a carpet; nails and cement free.

Buffalo Wall Board $22.50 Per Thousand

Why use lath and plaster when you can buy Improved Buffalo Wall Board? Wall board is no longer an experiment, but is twice as cheap as lath and plaster and four times as easy to put on. Any man with a hammer can do the job. Warmer in winter and cooler in summer. Send for sample today.

Let Us Be Your Heating Engineers Free

We have an experienced staff of heating engineers who do nothing but help our customers install hot water and steam heating. Every boiler is guaranteed to give perfect satisfaction. Send us the plan of your house and we will tell you how much it will cost to heat it, including boiler, radiators, pipe and fittings.

Serviceable House Dress

Made of Amoskeag check dress gingham, collar made of Kings' blue chambray, set-in sleeves, breast pocket; seams and cuffs piped with Kings' blue to match collar. Sizes, 34 to 46, at

86c

Men's Heavy Cotton Socks

Black and tan; these socks are suitable for working men and will give you good wear and comfort. Per dozen pairs

$1.38

Get This Free Book of 5,000 Bargains!

Over 500 big national manufacturers depend upon the Manufacturers' Outlet Company of Buffalo to dispose of their overproduction, whenever their own regular retailers fail to sell their output. Some years they have no goods for us and other times we sell up to half their output. None of these goods are "mail-order goods." None of them are sold to regular mail-order houses. Every article is made for regular local retailers, and every one is of the necessary high quality to stand the closest inspection before sale.

Send for our big free book today. Consult it whenever you need to buy anything for yourself, your home, or your farm. If we have the goods you need, you can buy them from us at prices that have never been equaled. And if we are sold out on the article in question, we send your money back the same day. We do not put goods in our catalog unless we have a sufficient supply to meet all ordinary demands, so you are safe in ordering anything you see in the catalog. All small lots are sold direct from these advertisements. Use our catalog when you buy, and you will save hundreds of dollars.

Men's Corduroy Trousers

Either in drab or brown color. This is a special thick-set corduroy, every pair guaranteed not to rip, sizes 32 to 42. Give waist measure and inseam when ordering. Price only.....

$1.95

Buffalo Crimped Fencing

If you want a fence that will hold up under all conditions, don't buy before you get our big fencing sheet. We have several thousand rods of the best grade fencing that is made. Heavy pure steel wire, triple galvanized. Patent lock joint cannot slip and will not rust like twisted or welded joints. 26 in. Hog Fence 14c per rod. 48 inch Field Fence 20c per rod.

This Brings 5,000 Bargains!

The Manufacturers' Outlet Co.

San Diego Panama California Exposition

The business of farming

FARMING as a business calls for efficiency methods just as much as any other business, and pays more than usual returns for care in such matters.

The Panama-California Exposition at San Diego, which opens January 1st and closes December 31st, 1915, is going to give more valuable information to people interested in farming than was ever before given by any undertaking in the world.

Facts as you want them

The Southwest has 44,000.000 acres of land ready and waiting for development. If you go to the San Diego Exposition you will be able to see the very latest methods of farming on a large scale, or the intensive farming of a small tract.

You'll be shown the advantages of each section, what it raises, the market, the cost of labor, average expenses, conveniences, water needed and available, cost per acre of best cultivation, profits reasonably sure to come, etc.

You'll see all kinds of farm machinery in the Exposition building and the same machinery in actual operation on the land; there'll be demonstration of farming on big and broad scale and examples of intensive farming where little land, very little can be made to support a family in comfort and plenty.

An Exposition of your tomorrow

You'll see what you could do with the means at your command; not just figures on paper but the actual doing of it on the farm.

This Exposition is to show what people are doing, what they can do, what you can do to increase your earnings and lessen your arduous labors. It isn't just an Exposition to show things that big manufacturers with modern plants of machinery have made.

It's an Exposition of Opportunity for you. Come!

Come for your pleasure and your profit, and for the pleasure of the family, bring your wife and children; it's an opportunity for pleasure that won't occur again soon; a perfect Exposition in a perfect climate.

Your nearest railroad ticket agent will tell you about the low rates.

THE CLOVERS IN NEW YORK.

Each has a Special Place.

THEIR PLACE IN AGRICULTURE.—It has long been recognized that clovers are good for the land, and that other crops are benefited when grown after them. They benefit the land in two ways; first, by fixing the nitrogen of the air by means of bacteria which are associated with them on the roots, and secondly by increasing the organic content of the soil. In New York, clovers are probably the most important single factor in the maintenance of the fertility of the land. It is often said that the growing of clovers will increase the fertility of the soil. This is only partially true. The nitrogen content of the soil is generally increased, especially, if the nitrogen content was low before the clovers were grown, but the amount of nitrogen added to the soil seems to depend rather on the amount available for the use of the growing plant. About two-thirds of the nitrogen used is considered as coming from the air, the other third from the soil. The potassium and phosphorus used by the clover crop is, of course, not returned to the soil directly unless the crop is used as a green manure. If it is removed from the land as hay, very little of the fertility which it contained may be returned. Regardless of how much of these two elements is brought up from the lower strata of soil by the deep and penetrating roots, which finally may become available in the surface soil, the growing of clovers tends to decrease the total amount of these elements in the soil, although at the same time it may greatly increase the availability of these elements to succeeding crops. From this point of view, clovers may materially increase the ready fertility of land for a while. But the problem of fertility is both one of increase, where low, and of maintenance, where high. In the evolution of a system of agricultural practice by which soil fertility can be kept up, the continuous cultivation of single crops has been replaced by rotation, first of cereal crops mostly, secondly by the introduction of grass into the rotation, and thirdly, by the introduction of a leguminous crop, usually clovers to be harvested or to be used as a green manure. New York has reached this latter stage where, not considering commercial fertilizers, clovers and other plants of the legume family are necessary for the rotation and maintenance of fertility. This is true wherever land has been long cultivated and cropped

A HEN WOMAN AND HER PARTNER. Fig. 578.

CLOVERS FOR NEW YORK STATE.—Because of climatic and soil conditions, only a few of the clovers are adapted to New York State conditions. The hay clovers are, in order of importance, Red, Alsike and Mammoth Red. The pasture clovers are White and Alsike. The green manure clovers are, Mammoth Red, Red, Alsike and Crimson. The reasons for such a classification, which may vary somewhat with local conditions, will be given later in this discussion. White Sweet clover—which is not a true clover, although it belongs to the clover "family," will without doubt come into greater prominence in the future, on account of its very wide range of adaptation to soil, climate and uses.

RED CLOVER (Trifolium pratense).—Red clover is sold and grown under many names. It is known as Medium Red, Medium clover, June clover, common clover, meadow clover, Broad-leafed clover and meadow trefoil. It is the most important clover in New York State. It requires a rather mild temperate climate. It winter-kills when subject to too severe conditions, and in the South cannot be grown on account of the heat. It does best on loamy soils, which are rather high in lime. On wet or acid soils, it gives way to Alsike clover. On drier and finer soils, it is surpassed by Mammoth Red clover. It is a perennial under favorable conditions, but in New York State it lives usually only two years, providing one crop of forage. This is due to the root-borer, an insect which attacks the roots, so that the plant seldom lives over the second year. The maximum yield of hay is usually secured if the plant is cut during early blooming stage; after this time the weight decreases. It should be harvested with a view to securing the largest yield and retaining the fine leaves and stems, making a hay of good quality and palatability. One objection to Red clover when mixed with Timothy, is that it matures about two weeks earlier than Timothy, so that the quality and yield of one must often be sacrificed for the other. Alsike and Mammoth Red mature about the same time as Timothy, but the first only yields about two-thirds as much as Red, and the latter does not give a hay of as fine a quality on account of its coarseness. Red clover makes an excellent green manure crop to plow under, probably one of the very best, but where grown, it is often considered too valuable for this purpose. It well deserves first place among the clovers of the State.

ALSIKE CLOVER (Trifolium hybridum.)—This clover is considered by some a hybrid between Red clover and White clover. It serves the double purpose of a hay and pasture plant. It is hardier than Red clover and more winter-resistant. It is adapted to climatic and soil conditions which are unfavorable to Red clover, growing on wet and acid soils. It does not prefer such conditions, but where they exist, Red clover cannot compete with Alsike. For these reasons it is well to mix a few pounds of Alsike seed with the Red clover, for hay purposes, so that the ground may be more completely occupied. Where the conditions of the field are unfavorable for Red, Alsike may persist and produce a crop. The plant is smaller than the Red, the stems are finer, and the yield is only about two-thirds that of Red clover. It matures two to three weeks after Red clover, about the same time as Timothy, so that Alsike and Timothy can be harvested under the most favorable conditions of growth. On account of its more perennial habit and its prostrate growth, it is better adapted to temporary pastures than Red, but it is not so good as White for permanent pastures, which makes a better sod and is more palatable. It is not affected by the root-borer and produces seed readily. It seems to find its best adaptation intermediate between those conditions most favorable to both Red and White clovers. This gives it a special value in meeting varied conditions.

MAMMOTH RED CLOVER (Trifolium pratense perenne.)—This is considered a variety of Red clover, differing from it in its more perennial habit, larger, coarser growth and its adaptation to more adverse conditions. It is sometimes called perennial red, sapling clover and pea-vine clover. It is adapted to drier conditions and to poorer soils than common Red. If grown under such conditions the growth is not apt to be so rank and makes better hay. Where it is grown under most favorable conditions, the growth is usually so large that it makes a coarse, fibrous and less palatable hay. Its yield is much larger the first crop than Red, but there is little after-growth. It blooms three to five weeks after Red. Where soil improvement only is to be considered, on account of its ability to grow on poorer soils, and to withstand adverse conditions, and its large, green growth, it is better than Red clover. On lands well adapted to Red clover, again, Mammoth clover cannot compete, but under conditions adverse to Red clover, Mammoth Red becomes the more valuable as a hay crop, and under most conditions would be most valuable as a green manure crop.

CRIMSON CLOVER (Trifolium incarnatum.)—This clover is often called scarlet and carnation clover. It cannot be generally grown in New York State. It requires a rather sandy soil that is warm and moist. It does not endure heat, so is usually planted after Summer, grows well until Winter sets in and starts growth again early in Spring, and is harvested the last of May or the first of June. Its greatest uses are as cover and green manure crops. On account of the stems being thick and hairy, and the leaves hairy, it makes a dusty and coarse hay, though of fairly good quality. It is what is known as a Winter annual. It must be sown in the Fall, and only where the Winters are mild. It is unlikely that it will ever become of any importance in this State. Although it has a lower lime requirement than Red, it cannot compete with Red when the latter can be grown.

WHITE CLOVER (Trifolium repens.)—This is sometimes called Dutch clover. It is the important pasture clover. It is spreading in habit of growth and forms an excellent sod, besides being a perennial plant. It requires a soil that is fairly sweet, its requirements in this respect being similar to that of Kentucky Blue grass. It is found associated with this latter plant, generally, and should be included in every pasture mixture. It is very palatable, and cattle will eat it in preference to Alsike clover. It takes from three to four years from seeding before it becomes established in a pasture, but when once established it is usually permanent, and certainly very valuable. It will be seen from the above discussion that the clovers vary greatly in their range of adaptations to soil and climate, and to use. Each clover, however, seems to have some distinct advantage which makes it peculiarly adapted to a given set of conditions. It should be the aim to discover the best clovers for the best places with a view to their most economic and best utilization.

JOHN H. REISNER.

THE DAIRY COW SAVES THE OHIO CORN BELT.

"THE dairy cow will be the salvation of our rich corn lands. They are becoming depleted in fertility," is the opinion of Lloyd Willcutt, of Mercer County, Northwestern Ohio. "The older farmers believed the rich black soil of Northeastern Ohio would last forever. Some maintain the theory, but we younger men can see they are wrong. I know a farmer 60 or 70 years of age. He raised corn from boyhood; a dozen years ago he began raising clover in the rotation, corn, wheat or oats and clover. He believed with the rotation the wealth of the soil would not be depleted, but now his soil is losing its efficiency, and this farmer is noticing that his corn crop is falling off each year. He is but an example. Others have learned the value of marketing grain products through live stock, they have lessened the drain on the fertility. We are going further, the dairy cow is the salvation of our robbed farms. In our section many of us sell cream, we feed the skim-milk to hogs, calves and chickens. Since the price of beef has been going up, we are not selling the male calves from the beef breeds as

much as heretofore. It was five years ago when the price of beef fell off that we started with the dairy cow. We have not increased rapidly, but steadily. With the increase in dairy population we are adding the silo, and the beef man is now learning from the dairyman that he can use silage to advantage. The number of silos was doubled this year. The farmer has more faith in the creamery man. At one time he was fearful of his test, he thought he was being skimmed by the creamery man, but now under State inspection the farmer is more confident in increasing his dairy herd." W. J.

DYNAMITE OR TILE FOR DRAINAGE.

IN reply to Henry C. Cox, page 1260, while he gave credit to dynamite for a lot of things it would do, he failed to show why dynamite would not drain the field. The fact that dynamite was used to blow the stumps is no reason to be eve that the one operation would do both, clear the field of stumps and drain it. In my estimation dynamite has *not* failed to drain this field because dyn mite was not used for that purpose there.

In regard to the pits that "stayed full" of water I would think that perhaps the persons in charge of the work wanted to make sure of getting the stumps out and used too much dynamite. A little goes a great way when properly placed. In that case the too much dynamite gave too big a hole. One must not get the impression that by blasting stumps in a swamp, the swamp will be drained. It will not, and this is the reason why it won't work out.

When we blast stumps we are not draining; these are two entirely different operations. In blasting a stump the charge is so placed that its force will throw up the stump. Dynamite will blow in the direction of least resistance. The stump goes, also some of the earth close to the stump. While it spent most of its force on the stump it also forced downward. This downward forcing, if the land is wet, will have a tendency to compact the earth. In order to test this out all we need do is to discharge a piece of dynamite that lies on the ground. We will find, after the explosion, that while little or no earth was blown into the air, there is a hole. If water were to be poured into it I doubt if it would drain off. These conditions, such as large pits, are many times made far worse by using too much dynamite.

The charge that is placed to drain land by the subsoil method is placed in a very different position from that of blasting a stump. In stump blasting the charges are placed or inserted under the stump in a slanting position, while in subsoiling it is placed at least three to five times deeper, and in an upright position. When rightly tamped its force is confined to the lower strata of the earth. Many a hole has been drained by placing the charge 10 to 18 feet deep. While some people have trouble in using dynamite for one purpose or other there are hundreds who have the best results. F. A. K.

Williamsville, N. Y.

REMARKABLE FARMING IN TENNESSEE.

I ENCLOSE a picture of a field of corn planted July 4, after a crop of oats had been pastured off until last half of June. It got so dry I could not plow it and kept stock on it. This field and two others, one planted June 24, the other July 6, have been in corn at least eight years out of the last ten. They are close to my dairy barn and I cover them with manure every year, about 20 acres, and make my silage corn on them, besides a crop of oat hay on at least one of them. The corn was cut for silage October 6 to 10, making it three months and four to six days old. It was not quite as matured as I like it, but was afraid to wait longer. I got 250 tons of silage off the land; seems good enough at this time.

With plenty of good manure, rotation is of little use to such land as this. I commenced rotating these fields 25 years since and found that I had much heavier expense in filling silo from fields farther away, and find my silo fields are good as ever, yes, better. The second thought is kindred to this. Rotation is talked so much that many people begin to rely on it entirely to improve their lands, and they find it a very slow business to sow wheat, corn, clover and grass, and cut it all off and sell it. The only rotation I think useful is one that puts something back when you remove the crop. Pay your land as you go. W. G. LENOIR.

Tennessee.

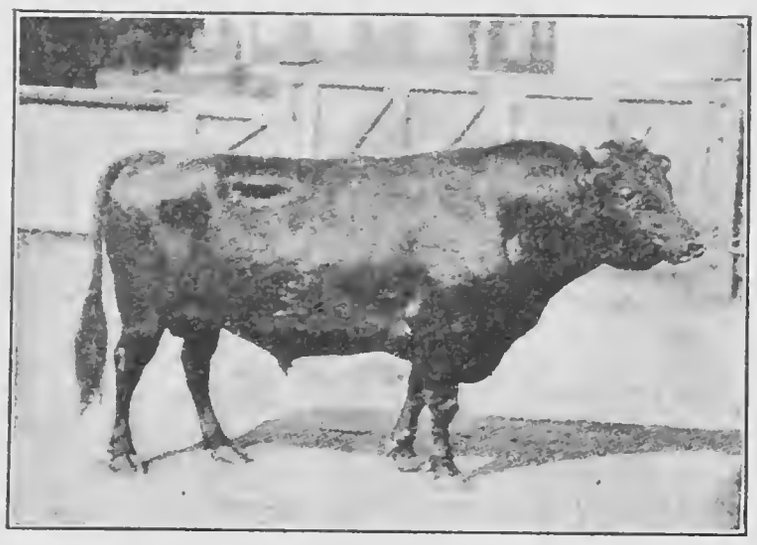
R. N.-Y.—The photograph was so dim that we could not make an engraving from it. It showed a field of corn standing like a thick forest. We see what Mr. Lenoir does with this land. It is close to the barn and therefore gives a very short haul for the bulky silage crop. Each year a heavy coat of manure is applied—this also giving a short haul. Then Winter oats in that climate will grow like rye or wheat. After they are harvested corn comes on again.

THE FRENCH-CANADIAN CATTLE.

COULD you give me any information in regard to the French Canadian cattle? I have seen some at the fairs, and like the looks of them very much, but would like to know a little more about them before buying any. Would they be good cows for butter, and do they give a good mess of milk? Are they easy keepers? Are they nervous, like the Jerseys?

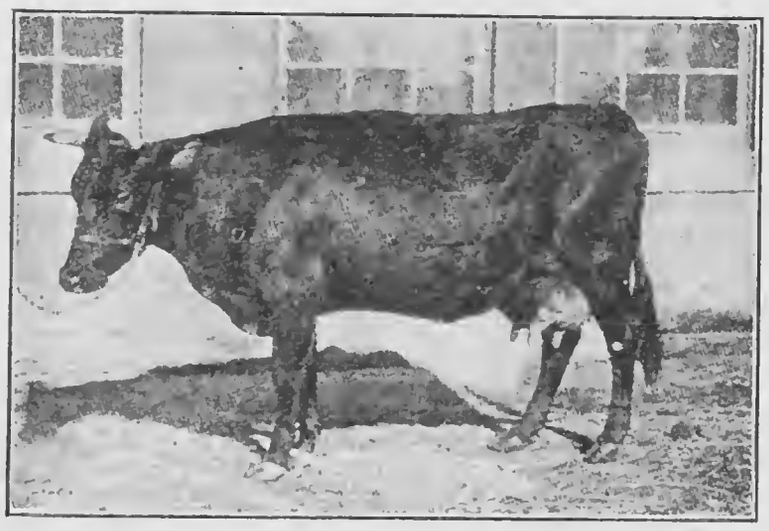
Chenango Co., N. Y. E. F. S.

The French Canadian cattle are well described in publications issued by the Canadian Experiment Station. Bulletins may be obtained by addressing the Department of Agriculture at Ottawa, Canada. This breed is chiefly noted for its hardiness and ability to rustle under rather poor conditions. The individual cow is rather small, weighing only 700 to 900 pounds. A good bull will weigh about 1,000 pounds. In shape or general conformation they are inclined to be



A TYPICAL FRENCH CANADIAN BULL. FIG. 579.

rather rough and angular, lacking the smoothness and even type of the Jerseys or Guernseys. In the cows, the wedge shape, so prominent in dairy cattle, is present and well developed. The color varies, usually a dark shade running from black to a dark brown. As milk producers they are not equal to the Jersey either in quantity or quality, although they resemble that breed closely in many of their characteristics. Probably an average of 6,500 pounds of milk a year, with a little over 4 per cent. butter fat, would be a fair standard production for the French Canadian. It is thought that the first individuals of this breed were brought from Normandy or Brittany by the early French settlers who came to Quebec and settled along the St. Lawrence River. Starting with this old-time stock the French Canadians represent



FRENCH CANADIAN COW, 6,639 POUNDS MILK IN 269 DAYS. FIG. 580.

the result of many years of "roughing it." As a result, while they may have fallen away in size, and somewhat in dairy quality from the old stock, they have acquired great hardiness, and are probably the most economical cattle in their ability to hustle and produce fairly well on light and rather poor rations. Our impression is that under forced feeding at dairy contests the French Canadians have not made a great showing, but as rustlers on a rough pasture, or in a cold country, they are hard to beat.

THE MOST PROFITABLE APPLE.

Figures from Nova Scotia.

THE question of varieties when planting apple trees is a most fundamental one. Most growers surmise there is a difference in net profits as between varieties, but in many cases their favorite is the one which turned out most barrels and most money the year before. Our Nova Scotian fruit is mainly middle-class apples, such as Blenheim, Ribston, Baldwin, Stark, Ben Davis, with Gravenstein, King, Spy, Wagener and Golden Russet as our high-class eating apples. Blenheims rarely go over 45 per cent. No. 1 (2½-inch diameter free from spot and worms), and soften easily in our ordinary storage. Ribstons are still worse, often not giving more than 33 per cent. No. 1, and have a very restricted market in London, not being liked in the North of England. They also soften badly in ordinary storage. Baldwins are a little smaller than the States apples—at least, such is the general opinion—and with less color. They average about 48 per cent. No. 1. They keep well, but need much thinning and pruning to get the size 2½ inches diameter, and I always disliked the color in Nova Scotia. Stark is an early bearer, extra fine growing tree, with solid crotches and an even branching system. The apples keep well, are fairly well flavored, though coarse, and for the last three years sell better than our Baldwins. Stark pack about 55 per cent. No. 1.

Ben Davis lacks size here. The color is fair. It keeps well, but becomes greasy and unappetizing to look at. It packs badly, only 40 per cent. No. 1.

Gravenstein is largely grown here, but being a delicate apple and having to be shipped in a hot part of the year, they arrive in poor condition, not making prices in proportion to their quality. Whether because of intensive cultivation or extensive pruning, about eight years ago it seemed quite probable that Nova Scotia Gravenstein trees would all die out. The trees appear healthier than at that time. Few are being planted. Gravenstein may have a future in Nova Scotia, as they can grow to fine size, color and flavor, but they will need pre-cooling or cold storage and better orchard care.

King is one of the varieties which suffered most from the old system of pruning. "Prune to stiffen up the branches" made the King grow much wood and "Thin out your top" gave the owner the pleasure of cutting it out. It usually took 12 to 15 years before Kings bore much fruit. Kings pack well—62 per cent. No. 1.

The Spy grows very fairly in Nova Scotia. The tree is sufficiently hardy, but needs much pruning (after the first six or eight years), as it sets too many apples, and also grows too dense. The apples as grown here in the past have poor color and size. They also packed badly, 42 per cent. No. 1. This tree will probably pay even better than most for extra pruning and thinning.

Wagener has come to the front as a filler and early bearer. They are also high-priced and a good shipper, the best being sent to South Africa from here. The quality is good, and as the tree is small they are ideal to thin. They pack about 61 per cent. No. 1.

I have few Golden Russets, but as mine only pack 18 per cent. No. 1 perhaps I have too many. I exceedingly dislike Mann as a tree, a bearer and as an apple to eat. Ontario is another poor variety which is an early and heavy bearer of very tender-skinned apples. They are poor shippers—worse than Spy to handle. These percentages of pack are based on the No. 1 apples packed out from the 100 barrels as they come from the tree on an average of about five years. We in Nova Scotia also pack No. 2 which are smaller, and No. 3, which are rougher or perhaps a little defective.

For the five crops, 1908 to 1912, I have my own figures and also those of another orchard, giving prices realized per barrel of about 125 pounds net weight of apples. This price is for the barrel of apples as it comes rough from the tree, and all expense of packing, commission and freight has been paid, leaving the following figures:

My fruit, five years to 1912; other orchard, 5 years to 1912; my last 1911-'12-'13 prices.

	1912	1912	1911-12-13
Gravenstein	$1.60	$1.63	$1.56
Ribston	1.53	1.50	1.10
King	2.04	2.29	2.09
Wagener	1.94	2.00	2.00
Ben Davis	1.51	1.56	Not settled
Northern Spy	2.11	1.88	Not settled
Stark	1.80	1.75	1.61
Blenheim	1.46	None	1.49
Baldwin	2.03	None	1.55
Mann	....	....	1.15
Ontario	....	....	1.04

These figures are useful, but to get an idea of what variety is most profitable one needs to have the figures on production. For instance, 15 King trees planted in 1886, in the nine crops, 1904 to 1912, bore an average of 2.67 barrels per tree per year; 18 Ben Davis, same age, same period, 3.35 barrels per tree per year.

But each barrel of apples costs to pick 15 cents, hauling five cents, barrel 28 cents and thinning five cents. So at values given above a King tree of this age would make a profit of $4.03 a year, and Ben Davis $3.28 a year, and a Spy tree $5.26. An acre of 50 Kings would be worth $37.50 a year more than an acre of Ben Davis, and 50 Spys would beat the Kings by $61.50 a year. As the base for my figures gets wider these figures will alter, and perhaps others will join to obtain them. JOHN BUCHANAN.

Nova Scotia.

IT seems to us very necessary that pupils in country schools should be taught to know the names and habits of weeds.

PRESERVING FENCE POSTS.

CAN I prolong the life of well-seasoned fence posts by using gas or coal tar? If so, would you state about how long a post so treated will last?
Virginia. W. D. S.

The decay of wood is a condition caused by low forms of plant life or fungi. These fungi require both air and moisture in limited amounts for their development. Moderate warmth also stimulates their action and growth. Hence it follows that wood decays most rapidly in warm, moist climates. Another fact also follows that if these conditions of air, moisture and warmth can be successfully controlled, decay will be checked, as the fungi cannot live. To combat these fungi three general methods are used: First, treating the woods with fungicides. This treatment relies on a fungicide that is forced into the wood to kill any spores that may be present, and thus prevent the growth of the fungi. It is not a satisfactory method where the wood under treatment is to be subject to dampness, as in the case of a fence post. Most of the fungicides used are water soluble, and under conditions where the wood is subject to more or less water, soon seep out and leave it in practically the same condition it was in before treatment. Second, waterproofing the wood under treatment: it has been found that when the water content of wood is kept as low as 10 per cent. there is very little if any decay present. This method fights decay on this ground, not by an attempt to kill the fungi, but so to fill the pores of the wood with a waterproofing compound that no water will be admitted, and the spores of the fungi prevented from securing a foothold because of a lack of moisture, the timber being thoroughly dried before treatment. Paint and coal tar come under this head: by making a more or less impervious coating over a stick they hinder to a certain extent the passage of water into it. However, in a place that is as subject to water as is that occupied by a fence post I would consider either as of very little value. A green timber, if painted, will rot quicker than the same timber would if left unpainted. The paint acts as a check to the passage of moisture, and in this case prevents the quick drying of the stick, promoting decay, as it furnishes conditions suitable for the growth of the fungi. Somewhat the same conditions exist in the case of the fence post, and to my mind paint or tar would be of very little use here, as they would prevent the stick from drying.

The third method consists of treating the posts or timbers with a substance that is both a water repellant and a strong disinfectant. The fact that it is insoluble in water permits its use in places where an ordinary antiseptic would be washed out. The fact that it is a strong disinfectant prevents the spores of the destroying fungi from getting a foothold in the wood. The coal tar creosotes come under this last head, and are probably our best wood preservatives for work of this class, i. e., fencing. The railroads use this to quite an extent in the effort to prolong the life of their woodwork. I have a letter before me now from the engineer of the maintenance of way of the New York Central Lines, stating they estimate that treating with creosote doubles the life of a tie as far as decay is concerned. They use one of the pressure systems; this causes the wood to take up a greater amount of the liquid than it would if treated by the "open tank" method. The cost was given as approximating 30 cents for a 6x8-inch tie 8½ feet in length.

Two methods of treatment are open to the farmer, the brush method and the "open tank" method. Where only a small amount of work is to be done the brush method is probably best. Have the wood dry and apply two or more coats of hot creosote to the surface with a brush, being careful to get the preservative into all the checks and cracks. Paint the post to a point that will come at least a foot above the surface of the ground. The portion of a post that rots out first is near the surface of the ground in most cases. In the "open tank" method the posts are allowed to soak for a short time in the hot liquid. Probably better penetration is secured in this way than by the brush method. Some of the companies handling this material have heaters that they loan or rent for a small sum to the farmers. The price is around 80 cents per gallon, a gallon treating in the neighborhood of 30 posts. In regard to the number of posts treated with a gallon much will depend upon the size of the posts and the wood from which the posts are made.

Posts are usually made from small trees; these contain a great deal of sap-wood. The sap-wood being more spongy and containing food in a more available form is more subject to the attacks of fungi, and therefore decays quicker than the more resistant heart-wood. Here is where the preserving process is of value, the sap-wood, because of its position and structure takes up a greater quantity of the preservative than does the heart-wood; in fact it is very seldom that the creosote penetrates to the heart-wood, and in this way is made as long lived as the remainder of the post. The post illustrated was exposed by a cut made in State road construction. It has been in place about nine years and previous to this had served as a rail for an unknown length of time.

DECAY OF FENCE POST. FIG. 581.

Some woods, as cedar, are filled with a gum that is a natural disinfectant, preventing decay. Here in the North we do not have so much trouble from the decay of wood posts. The writer has in mind a fence that was built over 10 years ago with cedar posts that cost only 2½ cents apiece at the time. The fence was examined this Summer, and very little decay found, although no preservative was used on them. The posts were well dried though, before setting. This has a great deal to do with long life.

The United States Government has recently completed a series of experiments on fence posts, the experiments extending over a period of 20 years. Various methods of preserving the wood were used. The experimenters determined that the "open tank treatment" was much more effective than charring, or applications of coal tar or petroleum oils. Creosote was the material that they secured the best results with in their "open tank" treatment. A list of the publications available on the subject can be secured from the Department of Publication at Washington, D. C. ROBERT H. SMITH.

REMEMBER that hickory tree with the superior nuts. It is needed to start a new industry. If you know of one—tell us.

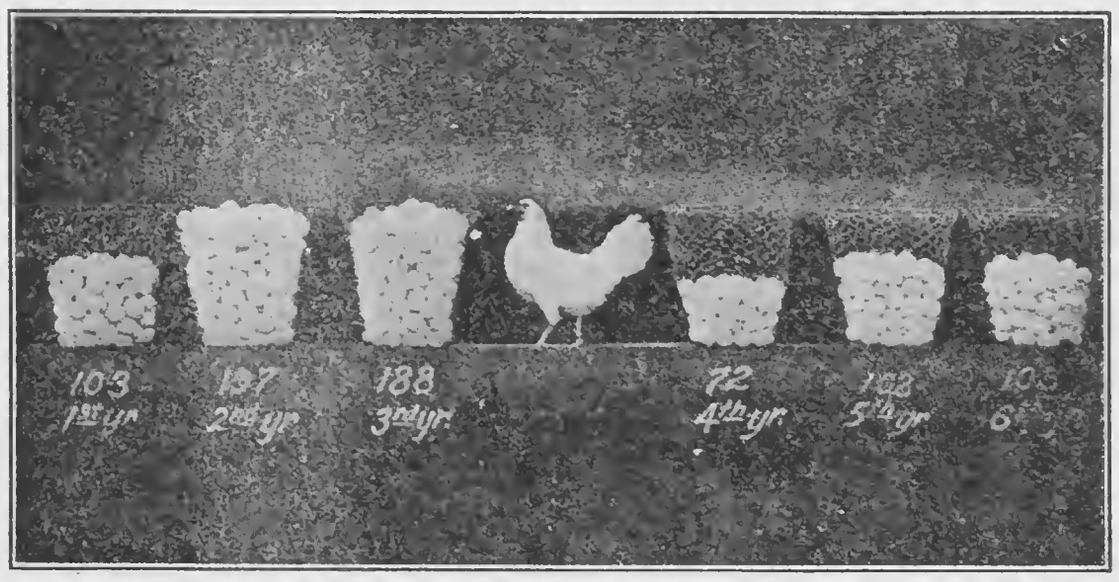
DO OLD HENS PAY?

HOW many years shall we keep a hen? This question comes up frequently for discussion, and the answers made by practical poultrymen are bewildering to a beginner. One man says that we should depend upon pullets entirely for laying stock. His scheme will be to keep the hens through their first laying season, then select the best of them for breeders and let the rest go. This plan is based on the general theory that a hen lays more eggs in her first year than in any other. Many poultrymen seem to believe that most of their hens cannot come back and give a profitable egg record the second year. The system based on this theory demands, of course, a vast amount of work in hatching and brooding, in order to keep up a full supply of pullets each year. On the other hand, there are poultrymen who say that we may well keep our hens two, three, or even four years, provided we have the ability to judge the layers properly or have some system of weeding out the drones. Naturally if we could keep our hens three years it would mean less work at hatching and brooding.

Does anybody know about this?

Bulletin 135 of the Utah Experiment Station, gives the results of a study in annual egg production. This is based on the records of a flock of seven-year-old hens and their progeny, and figures given are very interesting. For example, the picture at Fig. 582, shows a White Leghorn hen, and her comparative egg record for six years was started with 103 eggs. Under the usual system of judging layers, this hen would have been discarded as a drone, but the next year she came back with 197, and repeated with 188. In her fourth year she fell down to 72, yet in her sixth year she laid as many eggs as she had when a pullet. It is a question whether it paid to keep this hen after her third year, but such records are necessary in order to learn definitely about such things.

The cost of renewing the flock is considered one of the greatest drawbacks to the poultry industry, the authors estimating the cost of a pullet—probably up to laying age—at from 50 to 60 cents. The average productive life of hens cannot be estimated at this stage of their work, but for the strain used in their studies was thought to be about four years. The range of individual egg production in their flocks was found to be from 100 to 160 in the first year, from 105 to 140 in the second year, and from 100 to 130 in the third year. After the third year the production remained fairly constant at about 90, with a variation of not more than 10 or 15 eggs per year. The flocks giving a low first year record gave a comparatively high record the second year, and those giving a high first year record gave a low one in their second year, but the three-year average of all flocks was remarkably constant. This led to the conclusion "that an unselected flock of hens of a given strain has a certain potential laying capacity in its first three years, and that it makes very little difference how many eggs are laid in either of the first two years as the balance will be produced in the other two." The records beyond the third year indicated that there is a very definite laying capacity for old hens, and that there will not be much fluctuation from year to year. The average individual production for all flocks was 124 eggs in the first year, the same number in the second year, and 112 in the third. The conclusions were also reached that nearly all the longer-lived hens in a flock will lay over 500 eggs, the majority will lay 600 or 700 and individual records up to 1,000 may be expected. An average for the flock of 127 eggs per year for three years is unquestionably profitable and indicates good constitutional vigor. It was found that in flocks making high first-year records the second and third year's records were low and that in those making low first year's records the records of the second and third years were high, but the high layers of the first year continued to be the highest producers. The 10 hens making the highest second year's record gave a higher three-year total than the 10 making the highest first-year record. More hens made their highest year's record after than during their first year, and three made their highest record in their fifth year. Nearly all the hens in these flocks whose total production has been extremely high have made low or medium first-year records. "From these studies it appears that the three-year average is the most reliable index of the value of a given individual." M. B. D.



A WHITE LEGHORN AND HER SIX YEARS' RECORD. FIG. 582.

YES indeed, the legumes will make the following crops dance.

Mutton and Hare for Meat.

A LONG time ago, I think I saw in THE R. N. Y. something about South Americans raising a sheep or two instead of hogs and salting them down as the Southern people do hogs. I do not like so much hog meat. Can you tell me if it is practicable here? It seems to me sheep could be raised a great deal cheaper than hogs, and I would like the meat much better. Also, how about keeping a few Belgian hares for meat once in a while? We eat very little meat anyway, but like to have a little on hand for company. Once we thought we must have meat three times a day, and now do not have it once a month, and find we get along just as well and I believe we are in better health. E. R. S.
Virginia.

The people of Argentina eat large quantities of mutton. A good account of their habits is given in Joe Wing's book "In Many Lands." The mutton is eaten fresh or salted and smoked like pork. It can be put in cans also—as we have so often described. We can see no reason why the mutton may not be kept as well as the pork. It would be a good change. As for Belgian hares, there was a "boom" over them a few years ago; it has now mostly died out. We know several people who started with these hares expecting to obtain a full meat supply. They have now all given up the business. This is a case where experience is needed. Who can give it?

Trapping Rabbits.

R. W. C., New Jersey, page 1236, wants to get rid of rabbits. Put up a poultry netting wire fence, two feet high, around the patch. Just tack it to temporary stakes. Every 50 feet make a square jog large enough to receive a barrel, which must be sunk in the ground

level with the top of barrel, as shown in diagram. Rabbits will follow along fence and go in on "tip-up," which sets itself again after rabbit has dropped to bottom of barrel. Orange growers in California have these around their groves and they work to perfection. G. H. S.
Monticello, N. Y.

Late Cover Crop.

I HAVE a piece of ground that was in potatoes dug about November 10. I wish to raise tomatoes on this piece of ground next season and desire to sow some cover crop this Fall that can be turned under next season. We set tomatoes about June 15, so thought that rye or barley could be sown this Fall and turned under before it grew too large next season, so that the ground would have time to settle and the green matter have time to decompose before the tomatoes were set. What do you think of this plan? Would it be well to sow a cover crop of this kind to be turned under in the Spring for the purpose of seeding Alfalfa in the Spring? The land in this section needs humus in the soil. Up to October 25 we had no frost here this season.
St. Michaels, Md. J. W. B.

At this late date rye is about the only thing you can sow for a Winter cover. You could have sown Crimson clover after an earlier crop, and but for the digging of the potatoes could have had a stand of clover among them as our growers do among their tomatoes and cantaloupes. But in sowing rye sow a bushel and a half to get a good stand, and then turn it under before it gets strawy, or when it is about knee-high. In that green stage it will decay rapidly, while allowed to run into head it will decay slowly and be in the way in dry weather. Give the rye some acid phosphate and you will get it back for the tomatoes, for the soil will hold on to it, what the rye does not use, and what it does use will be returned to the soil. Tomatoes need plenty of phosphoric acid. I would never sow Alfalfa in the Spring, for the crab grass will be pretty sure to smother it. Better sow cow peas in the Spring after a Winter cover of rye, and you can make a good crop of hay and get the land in order to sow the Alfalfa in late August if you sow an early variety of cow peas. Or you can turn under the peas in August and give the land a heavy dressing of shell lime and prepare it for the Alfalfa. The first Alfalfa I ever saw growing was in your town in 1852, and it was then called Lucerne. W. F. MASSEY.

Killing Weed Seeds in Manure.

WEED seeds in manure are often quite troublesome, and we have tried various plans and methods in overcoming them. Some years ago we noticed that the manure from spent hotbeds becomes very hot, sometimes as hot as 125 degrees, and no seed of any kind can survive such a high temperature. Acting on this suggestion, we began to treat our manure to be spread on the garden to a violent heat. The process takes some time, but we have found that our work of fighting weeds has been greatly lessened. We haul the manure in the garden in the Spring, in large, even, flat piles of about 20 loads each. When one pile has been finished, we commence another, and so on. When we find by the use of a hotbed thermometer that the heat has reached its highest point, we turn it, and allow it to heat up again, after which we spread it on the land. We continue treating pile after pile in this way until all have been treated. Of course, one heating might answer very well, but a double fermentation is much surer, as handling and displacing the manure twice makes all parts of the pile come inside, and consequently the weed seeds in the pile are much more likely to be killed. D. L.
Indiana.

Sour Honey.

WHAT use, if any, can be made of comb honey that has soured? How prevent souring? E. J. L.
Briarcliff Manor, N. Y.

I do not know of any use that can be made of soured comb honey; possibly, some reader may have discovered a method of utilizing it. Honey should always be stored in a warm, dry place, to prevent its souring. The mistake is frequently made of storing it in the cellar, where moisture collects upon the comb and results in diluting and souring the contents of the cells. A warm, dry attic, or upper room, where the honey cannot freeze, is the most suitable place for keeping the surplus supply of this sweet. The writer now has several sections of white clover honey that have been kept for two years in the chimney closet of an upstairs bedroom without deterioration. M. B. D.

Battling With Peach Borer.

AT what season, or part of the season, is it necessary to pursue the peach borer? In other words, is its piracy continuous, or is it troublesome at certain periods, and what periods?
Mendota, Ill. L. B. C.

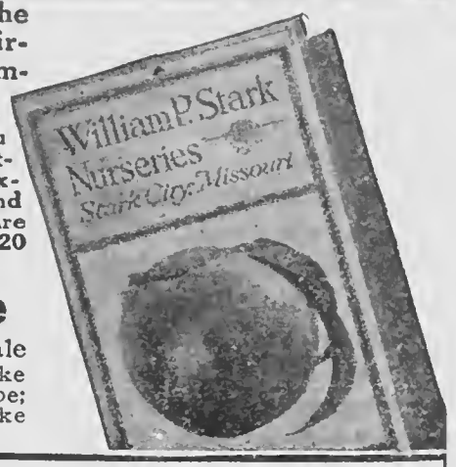
In our own case we begin now to dig out the peach borer. The eggs from which this insect is hatched are generally laid in this latitude in late June or early July. The insects hatch at the base of the tree, and begin to gnaw their way down to the root. Many peach growers now follow the plan of spraying the trunks of their trees near the ground with a thick solution of lime-sulphur. This destroys many of the young worms, and prevents others from working into the tree. It hardly pays to dig out the borers until October or November, as they are not large enough to be readily seen earlier in the Fall. We follow the plan of scraping away the dirt from the base of the tree, finding the hole which is made evident by gum containing sawdust, and working down through the hole until the insect is found. A sharp, small knife is good for this purpose; make sure to slit or cut down the trunk and not across it. After this digging a mound of earth or coal ashes is piled around the tree, and in late April in the following Spring we go over the trees again, for any borers which may have been left at the Fall digging. This treatment with washing or spraying the tree trunks with lime and sulphur is as good as anything we know of. Soft asphalt is being used by some growers, who report fair results from its use. We have continued to use the digging method.

"THE people of London are noted for their stupidity," wrote a schoolboy. "Where did you get that idea?" asked the teacher. "Please, miss," was the reply, "it says in the textbook 'the population of London is very dense'!"—London Evening Standard.

"For the Land's Sake, use Bowker's Fertilizers; they enrich the earth and those who till it."—*Adv.*

These Strong, Heavy Roots Mean Earliest Bearing Orchards

Strong, heavy, spreading roots, grown the William P. Stark way, produce healthy, virile, fast growing trees that establish themselves quickly and come in to bearing very young. William P. Stark's Ozark Mountain trees are famous for their unusual root-systems. You will find the trees we ship you far surpassing your expectations in the splendid root-growth they have made this season. These roots are exceptionally heavy, thick, fibrous, with strong laterals and tap-roots. They are trees of an "over-value." They are trees that we guarantee will please you. Write for our 120 page catalog now. Get your list in early. It pays.



J. H. Hale Peach—Paid $1420 Per Acre

Those are Mr. Hale's returns from his J. H. Hale peach orchards. Never before has there been a peach like this. Averages ⅓ to ½ larger than Elberta; round shape; golden yellow flesh, carmine skin; *practically fuzzless* like an apricot; flesh firm and meaty as a cling, yet perfect freestone; weighs 12% more than Elberta; ships immense distances; wonderful keeper; exceptionally hardy; late bloomer; long fruiting season; ripens 5 to 7 days ahead of Elberta; brings 33% to 50% higher prices. Read whole story in catalog.

Genuine Trees *Only* from Wm. P. Stark Nurseries

Be on your guard against unscrupulous agents or concerns offering so-called J. H. Hale peach trees. We grow J. H. Hale trees under exclusive contract with Mr. Hale and are *the only authorized distributors. Genuine* J. H. Hale peach trees, budded from Mr. Hale's own orchards and bearing tag with his signature can be obtained *only from Wm. P. Stark Nurseries, Stark City, Mo.*

True Delicious Apple Trees at Grower's Prices

Delicious, the most profitable apple you can grow. We furnish genuine Delicious trees, Stark-Ozark Mountain grown at prices you ordinarily pay for inferior varieties. Get our money-saving prices on all other tested profitable varieties listed in our catalog.

These are the kind of trees you get from Wm. P. Stark Nurseries

Two Year Old Apple Trees Trained to Bear Heavy Loads

Our two-year old trees are especially grown with branches on upper 14 to 16 inches. You can prune to form open, vase-shaped heads, without weak crotches—either medium or low head, as you like. Such trees are longer-lived, less subject to injury and bear heavier loads without breaking than trees as ordinarily grown in nurseries, with all branches starting from one point near the top.

Send for This 120-Page Book — MAILED FREE!

Written in a way you will like and understand. Fully illustrated with photographs. Lists and describes best varieties of apple, peach, pear, cherry, plum, apricot, quince, grape, blackberry, raspberry, dewberry, gooseberry, currant, nut trees, shade and ornamental trees, roses, decorative shrubs, vines, etc. Gives season and time of ripening, where each variety thrives best, most satisfactory sorts for your locality, handy, pocket size, for quick reference.

No Agents—Save 30% to 50% by Buying Direct from Nursery

We save you a third to a half on your trees because you deal direct with us, the growers. No agents, no canvassers, no "plate-book" men. Our catalog is our only salesman. Prices printed in plain, black figures under each variety. Same price to all. Make a big saving and get better trees, doubly guaranteed. We give your orders personal attention. Send for the catalog now; we ship trees whenever you direct.

Big Apple Trees
At Little Prices

My apple trees are extra good, with splendid roots, sturdy trunks, well formed heads, and my prices are low for such fine stock. My book tells more about these trees; you may have a copy if you send me a postal today.
SAMUEL FRASER, NURSERYMAN,
124 Main Street, :: Geneseo, N. Y.

NEW PEACH The Marion Hayward has been described, tested and painted by the U. S. Dept. of Agriculture. Ripens Aug. 20th to Sept. 10th. Orders taken now for fall and spring deliveries. Send for literature. Marion Hayward Orchard, Commercial-Tribune Bldg., Cincinnati, O.

Trees—Plants—Vines

In small or large lots at wholesale prices. Catalog and Green's Fruit Book—FREE. Green's Nursery Co.
22 Wall St., Rochester, N. Y.

FOR EARLY RESULTS, permanency, excellent quality and profit, try the **DOUGLAS PEAR**. Introduced by **A. H. GRIESA, "The Pines," Lawrence, Kas.**

ST. REGIS RASPBERRY PLANTS for sale Price reasonable. **PAUL L. HEGGAN, Waterford, N. J**

McDONALD—DEWBERRY—BLACKBERRY HYBRID. Try this new berry. The earliest and most productive berry in existence. Plants are evergreen and have produced berries two inches long. Price list. **J. E. FITZGERALD, Stephenville, Texas**

St. Regas Raspberry Plants

Plant St. Regas. Don't wait until everybody gets them. They are a money-maker. They come earlier than any others grown in this section, where they originated, and pick until frost. The best of reference. **ARTHUR R. HEGGAN, Waterford, N. J.**

Seed Oats and Buckwheat

grown from imported seed, on Pocono Plateau, 2000 feet above sea level.
Oats from Denmark (Trifollum) a stiff stem variety. Buckwheat from Japan (Nishigahara). The best we could get. If interested, send for sample and prices. As the supply is limited, do not delay in placing your order if you want to improve your crops.
POCONO SEED COMPANY
Dept. B, Stroudsburg, Monroe County, Pa.

LET US TAN YOUR HIDE.

Cattle or Horse hide, Calf, Dog, Deer or any kind of skin with hair or fur on. **We tan and finish them right;** make them into coats (for men and women), robes, rugs or gloves when ordered.
Your fur goods will cost you less than to buy them, and be worth more. **Our illustrated catalog** gives a lot of information which every stock raiser should have, but we never send out this valuable book except upon request.
It tells how to take off and care for hides; how and when **we pay the freight both ways;** about our safe dyeing process which is a tremendous advantage to the customer, especially on **horse hides and calf skins;** about the fur goods and game trophies we sell, taxidermy, etc. If you want a copy send us your correct address.
The Crosby Frisian Fur Company, 571 Lyell Ave., Rochester, N. Y.

SAVE HALF Your Paint Bills

By using INGERSOLL PAINT—proved best by 66 years' use. It will please you.
Only paint endorsed by the "Grange."
Made in all colors—for all purposes.

The Home Acre.

NOTES FROM A MARYLAND GARDEN.

GLADIOLI FROM SEED.—It is now near the middle of October, and the weather seems to have turned back to Summer since the cool September, for last week we had the mercury up to 90 on one day, and warm Summer weather all the time. The favorable conditions have brought out a wonderful bloom on the Dahlias, which a little while back seemed to be nearly a failure. Now they never were finer. Last week at the meeting of the Vegetable Growers of America in Philadelphia I was particularly attracted by the exhibit of Dahlias and Gladioli made by Mr. Burpee. The Gladioli were especially interesting, not only for the lateness, but the beauty of the flowers, and the fact that they were grown this season from seed sown in May. I have had Gladiolus corms get large enough the first season to bloom the next year, but never had any to bloom the first season from seed.

DROUGHT AND VEGETABLES.—The dry Summer has made some peculiar conditions in the vegetable garden. I sowed my first spinach, as usual, for Fall cutting early in August. Here and there a solitary plant made its appearance, and after waiting a month I ran out rows between the first ones and sowed again. Since the more favorable conditions since the first of October, all the sowings have grown well and I now have a thick stand of small plants, and here and there a big one ready to cut. My last sowing of spinach to winter over for Spring was made October 9. I have found that seed sown during the first half of October up to the middle of the month will give me better plants for the Spring than those sown earlier, as they do not run to seed so quickly, and they always get large enough to pass our Winters here, where the climate is much modified by the ocean on one side and the broad Chesapeake on the other. The influence of a great body of salt water is peculiar on some things. Right down along the bay shore and on the ocean front the figs grow and bear luxuriantly, while a few miles in the interior they are sure to get killed back every Winter.

FALL ONIONS.—My onion sets of the Norfolk Queen and the Yellow Potato onion planted in September are now well up, and growing rapidly, and another planting of the Queen was made on ninth of October. This onion makes the earliest of green onions, and I have in mild Winters had them ready the last of February, and always in March. I throw a small furrow to each side of the rows in November as a Winter protection to be pulled away early in Spring.

STRAWBERRIES.—We have found that here and southward November is the best time to set strawberry plants. The soil is then permanently moist for the Winter, and they live better than earlier. In North Carolina I have had the November-set plants make nearly a full crop in the Spring. Just now I am watching with interest some seedling strawberries which have maintained a vivid green all through the dry, hot weather. We cannot hope to produce fruit much better than many varieties we already have, but if we can grow plants with vigorous resistance to untoward conditions, which make good fruit, it will be an advantage, for many of the best fruits have the bad character of rusting foliage in Summer.

TOMATOES.—The tomato canners are nearly through their season and it has been comparatively a short one, as the crop was late, and cut short by the dry weather. The pack will be larger than was once expected, however.

GLADIOLUS. — The Gladiolus corms are smaller than usual, owing to the drought, but I have never seen them make such masses of cormlets, though these were scarce on some when I began the digging, while further on the corms were literally covered with the little ones. As the Gladiolus stands the Winter here, and the scattered sets come up in Spring like wheat, I shall sow a lot of the little cormlets in November, expecting to have better germination in the Spring. The earliest blooms I had this year were from corms overlooked last Fall in digging. But we dig them in the Fall to get the ground for other things. Fall planting of all deciduous trees and fruit trees is far better here than Spring planting. Our soil does not freeze deeply and they make new root fibers and root hairs ready for the swelling buds in Spring and I have always had the trees and also shrubbery to live better from Fall planting.

Maryland. W. F. MASSEY.

Preparing Celery for Winter.

AS it is now time for preparing celery for Winter keeping, I wish to tell my experience with it during the last two years. In the Summer, when ready to transplant my celery, I have a deep trench dug the length of my garden. As my garden slopes gently in that part of it I find it very easy, in case of a dry spell, to supply the plants with water by simply pouring cans of water at one end of the row and letting it run the full length of the row. Care must be taken to pour the water very slowly when the plants are small, else they will be washed out. I grow Golden Self-blanching, and begin banking it up in September. I simply gather each bunch together and wrap it, not too tightly, with a short strip of cloth, and then pack the dirt tightly around it. The trench facilitates the first banking also continuous banking goes on until danger of a freeze, when it is covered for the Winter. I do this by covering it over very deeply with clover chaff and just let the celery remain in the ground. During the Winter, when you wish celery, pull away some of the chaff, get your celery and for whiteness, crispness and tenderness it cannot be beaten. MRS. W. F. N.

Clymers, Ind.

Oct. 26. Wheat $1.05; oats 50; corn 78; potatoes 50 to 65. Hay $14 to $16; cabbage $2 to $4 per 100; carrots 50 per bushel; turnips 50. Hogs 7 to 8 cents per pound live; cattle 5 to 8; chickens 11 to 15; eggs 35; butter 30 to 38; apples 50 to $1 per bushel; pears, Keiffer, 50 to 75; onions 75. W. C. S.

Berea, Ohio.

Oct. 25. Conditions in this section of Nebraska continue favorable. The weather has been ideal warm and dry most of the time, with enough rain to keep pastures green and making ideal conditions for the growth of Fall wheat. There has been a large area sown to wheat, the time for seeding extending from September 10 to October 20. This late seeding is done for the purpose of avoiding Hessian fly, but experience has proved that such late-sown wheat has a good chance of making a better yield than the earlier sown. Corn husking has begun, and the yield is moderate, as high as 50 bushels per acre, and down probably an average of 25 bushels. To the east of us, however, as far as the Missouri River, the crop is very much lighter. There is an abundance of hay, both wild and Alfalfa. Timothy and clover are not raised in very large quantities, although both do well here. Potatoes are a fair crop, but many carloads have already been shipped in from the sand hill country of Northwest Nebraska, also from Minnesota at the Red River region. Cabbage comes from somewhere outside the State, and sells at $1.25 per 100 pounds. Hogs seem to be scarce, still the markets are well supplied, and prices are around two cents off per pound. There is a decided slump in price of horses and milch cows, probably 25 per cent. Wheat is now selling at 96 cents; oats 45; corn 75 for old corn; potatoes 70 to 80; hay $9; butter 25; eggs 20. Apples from the Ozark region $1 at car. There has been no frost yet, and none in sight.

Fairbury, Nebr. H. M. R.

Carries Three Loads to Market while Team of Horses is taking one

THE motor truck on the farm was a short time ago a rarity. Now it is coming to be regarded as a genuine *necessity*. Farmers, fruit growers and dairymen are rapidly discovering the tremendous advantage of having a vehicle which carries their goods to railway station or market quickly and without fatigue, no matter what the distance.

"Shall I make the investment? Shall I put that much money into a delivery car?"

That is the question every man will ask himself. The following facts may help you to a wise decision:

One *Autocar* will do the work of three double teams at a *lower cost of maintenance*.

The *Autocar* is designed especially for country roads—to make long trips in any kind of weather.

Autocar construction, the result of 17 years specialization on one type of chassis, is rugged enough for any emergency. A fruit grower recently wrote us his *Autocar* had traveled 32,000 miles without a serious breakdown.

Think of the times when you have been held up in the marketing of your fruit or produce by the slowness of horses and wagons. Think what it often means to miss the *good* prices of a certain date and be forced to take the *poor* prices of the day after. An *Autocar* will carry *three* loads to market while a team of horses is taking one. It markets your goods *quickly*.

The Autocar

"Used in Every Line of Business"

Let us give you the names of some of the *Autocar* users. Our new catalog will also be mailed if you write us. Address Dept. R.

THE AUTOCAR COMPANY, Ardmore, Pa.

Established 1897 *Motor Delivery Car Specialists*

Use NATCO Drain Tile—Last Forever

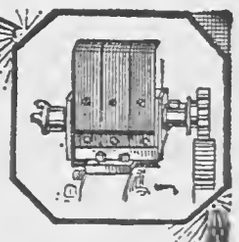
Farm drainage needs durable tile. Our drain tile are made of best Ohio clay, **thoroughly hard burned.** Don't have to dig 'em up to be replaced every few years. Write for prices. Sold in carload lots. Also manufacturers of the famous NATCO IMPERISHABLE SILO, Natco Building Tile and Natco Sewer Pipe.

NATIONAL FIRE PROOFING COMPANY, Fulton Building, PITTSBURGH, PA.

A Big Hot Spark—A Quick Start

No More Battery Troubles

—or expense, either, when you own a Lauson Frost King Engine. New Sumter Gear Driven Magneto built into the engine entirely eliminates batteries, their expense and troubles.



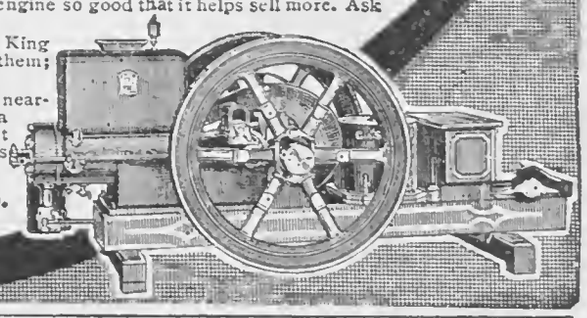
LAUSON FROST KING

Gasoline and Oil Engines

We are the pioneer users of a built-in gear driven magneto on farm engines. Others have followed our lead, but use a cheaper magneto for their cheap engines. Like all other Frost King Parts, the magneto is high grade and designed for long and satisfactory service. You take no chances when you buy the Lauson Frost King, for our policy is to build every engine so good that it helps sell more. Ask us about Lauson Service to users.

Guaranteed—We absolutely guarantee Lauson Frost King engines to make good on every claim we make for them; also as to workmanship and material.

Write for New Engine Book and name of nearest dealer who will be glad to give you a demonstration of the Frost King without obligation on your part. In writing us state size engine you need.



The John Lauson Mfg. Co.

218N.W. St., New Holstein, Wis.

For Hunters—Trappers—Farmers—Automobilists, Etc.

THE BALDWIN CARBIDE LAMP

Generates and Burns Acetylene Gas

Makes night hunting and fishing greater sport than ever.

Throws a wide circle of light 150 feet on the darkest night. More powerful than electric light. Makes night driving, hunting or boating safe. Can be carried as a hand lantern or worn on the cap or belt, leaving both hands free. Fine for working about machinery, repairing punctures at night, hunting stray cattle, etc.

TRY THIS LAMP FOR TEN DAYS

Order a Baldwin from us or your dealer. Use it for ten days. If not entirely satisfied, return the lamp and we will refund your money. Your dealer is authorized to make the same arrangement with you.

FREE TO YOU

Send us your dealer's name and we will mail you our very instructive booklet, "Knots and How to Tie Them." You should have this. The illustrations show you how to tie many kinds of knots.

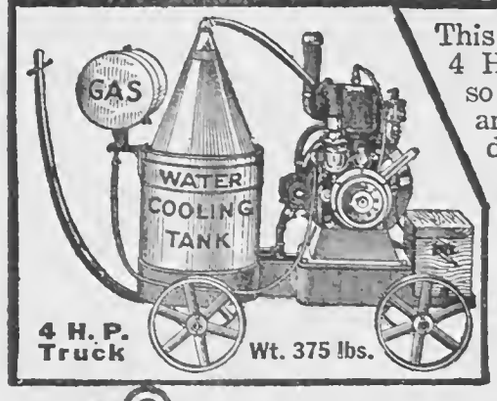
Cushman Light Weight Truck



This is the light-weight, quick-action 4 H. P. Truck Outfit that has proved so handy for farm work. **A boy can pull it** around from job to job, yet it easily handles all work up to 4 or 4½ H. P. Pump circulation to water tank on front of truck **prevents overheating,** even on all-day run. Cushman Engines are not cheap engines, but they are **cheap in the long run.** They are built to run without trouble, and are the most useful engines made

For All Farm Work

And For the Binder

Very light weight and steady running permits Cushman Engines to be attached to other machines, such as harvesters and balers, as well as doing all regular stationary jobs. 4 H. P. alone **weighs only 190 lbs.;** 2-cylinder 8 H. P. only 320 lbs. **Throttle governed;** economical of fuel. 4-Cycle. **4 to 20 H. P.** Runs at any speed; speed changed while running.

C. M. Scott, Pawnee City, Nebr., says: "I bought a 4 H. P. Cushman and think it is the **finest engine I ever saw run.** Am grinding shelled corn—can grind 30 bushels per hour with 6-inch bulr grinder. Have seen a great many other engines, but the Cushman has them beat at every turn."

EVENTS OF THE WEEK.

DOMESTIC.—Another landslide at Gold Hill, Culebra Cut, blocked the Panama Canal Nov. 2.

Nov. 1-3 a number of deaths occurred in and near Bristol, Vt., as a result of manufactured "whisky" with a wood alcohol base. The death list was expected to reach 25, while a number of other victims were blind or crippled. The liquor was illegally sold by a druggist, the town being "dry."

The Department of Justice at Washington announced, Nov. 1, an agreement with the American Smelting and Refining Company whereby title to several thousand acres of coal lands in Colorado, alleged to have been illegally obtained years ago through dummies, will be restored to the government. The lands are part of a 2,214-acre tract near the town of Aguilar and part of 1,280 acres at Cokedale. They are estimated to be worth millions of dollars.

Three persons were killed and one was seriously injured as a result of a race between an automobile and a train on the New York and New Jersey Railroad at Haverstraw, N. Y., Nov. 1.

An indictment charging a criminal conspiracy to violate the Sherman anti-trust law was handed down in the United States District Court, New York, Nov. 2, against twenty-one men, directors or former directors of the New York, New Haven and Hartford Railroad. Joined to these 21 are the names of 45 other men, also directors or former directors, who are designated as "co-conspirators," but they are not indicted. Among them are the names of men long since dead. Summed up, the men indicted and those characterized are charged with a conspiracy which began about the date the Sherman law was passed and continued up to October 30 of this year whereby they obtained a monopoly of practically all the land and water transportation facilities of New England and stifled all competition.

Federal troops have been ordered to the Hartford Valley coal district in Arkansas, where serious labor trouble exists.

Election returns Nov. 3 were largely favorable to the Republicans. The Republicans gained mostly in the New England States, New York, New Jersey and the Middle West. Boies Penrose was re-elected to the Senate from Pennsylvania by a tremendous majority over A. Mitchell Palmer and Gifford Pinchot. In Connecticut five Republicans will replace the delegation of five Democrats now in the House. James W. Wadsworth has been elected United States Senator from New York. "Uncle Joe" Cannon is returned by the 18th Illinois District. The ex-Republican Speaker had seen thirty-eight years' service in the lower body when defeated two years ago by Frank T. O'Hair, who was his opponent at this election. Gov. Glynn of New York was defeated by Chas. S. Whitman. Woman's suffrage amendments were defeated in five States, but won in Montana and Nevada. Ohio and California voted against prohibition, while Washington, Colorado, Oregon and Arizona went "dry."

THE EUROPEAN WAR.—Oct. 29 bombs dropped by a German aeroplane killed 19 women and injured 40 in the market place at Bethune; another bomb dropped in Dunkirk killed a woman and child.....Coast districts in Belgium being flooded by cutting the dikes, the Germans have abandoned the violence of their attacks along the Yser, and have concentrated farther inland. French gains were reported Nov. 5; there is little general change except that the Germans are not perceptibly advancing. Severe fighting is incessant.....Oct. 28 the German cruiser Emden, disguised as a Japanese, entered the harbor of Penang, Straits Settlements, and destroyed a Russian cruiser and a French destroyer with torpedoes.....Oct. 29 a German converted cruiser was sunk in the Adriatic by a British destroyer squadron.....The British cruiser Hermes was sunk by a German submarine in the Straits of Dover, Oct. 31.....The British submarine D-5 was sunk in the North Sea, Nov. 3, by a mine..... The German warships Gneisenau, Scharnhorst, Nurnburg, Leipsic and Dresden attacked the British cruisers Good Hope, Glasgow, Otranto and Monmouth off Coronel, Chili, Nov. 1, sinking the Good Hope and Monmouth, while the Glasgow and Otranto, badly damaged, put into Coronel. There was heavy loss of life.....Great Britain has announced that the whole of the North Sea is now a military area, closed to merchant shipping, owing to danger from mines and warships.....A German squadron left Wilhelmshaven, Nov. 3-4, and a raid on the English coast was then expected. One British submarine and two mine drifters had been sunk in action Nov. 4.....Oct. 30 the Turkish warships Hamidieh, Goeben and Breslau bombarded unfortified cities on the Black Sea, including Odessa, without any previous declaration of war. The two ex-German vessels sunk two Russian gunboats and two Russian passenger steamers. Later Turkey offered apologies, which were not accepted. Egypt has been put under martial law by Great Britain. Nov. 4 the Anglo-French fleet was shelling Dardanelles forts and Russian and Turkish forces were in battle in the Trans-caucasus. Mohammedans in India announce loyalty to Great Britain.....The Boer rebellion in South Africa has not extended and is reported generally suppressed.

FARM AND GARDEN.—The officers of the Cumberland White-Egg Indian Runner Club for the ensuing year are: President, C. S. Valentine; Vice-President, Mrs. Andrew Brooks, Auburn, N. Y.; Acting Secretary, Eugene W. Davies, Everett, Washington; Directors, Mrs. Mollie Allen, Oswego, N. Y., O. P. Vandenberg, Clay, N. Y., Geo. W. Dallas, New Iberia, La., Mrs. W. S. Ritnour, Gulfport, Miss., Mrs. Benigna G. Kalb, Honston, Texas, Mrs. John Harter, Marshall, Texas, Eugene W. Davies, W. W. Harder, Edmonds, Wash., and D. L. Rogers, Dunnville, Ont. Chairmen: Business Unity, Peter E. Pass, Candor, N. Y.; Press, Mrs. E. G. Feint, Cortland, N. Y.; President's Aides, Miss Beulah Maxey, New Berlin, Ill. The Penciled Runners go into the Standard of Perfection under the Cumberland Club's own color-standard.

The American Rose Society last Spring completed arrangements to cooperate with the United States Department of Agriculture in establishing a rose garden at Washington. The society is furnishing the roses, while the Department has set aside two acres of ground at its Arlington farm for the garden, which will be under the direction of federal horticultural specialists. The garden already contains about 320 varieties, but there are many hundred kinds not yet included, and eventually the site can accommodate as many as 2,000 varieties if they can be secured. Any grower of roses who thinks he may have roses not already in the national collection, has been invited by the American Rose Society to contribute a sample plant. Correspondence concerning such plants should be sent to Mr. Alexander Cumming, Jr., Cromwell, Conn., who is chairman of the society's Committee on Gardens. Either Mr. Cumming or the Department of Agriculture will supply a plan of the garden and a list of varieties already grown to the interested rosarian who applies for them.

Nov. 5 the Federal Government ordered the closing of the Chicago Stock Yards, because of foot-and-mouth disease. This closing takes effect Nov. 7-15. The disease is reported at one Iowa point and the International Live Stock Show may be given up. The quarantine has been extended to cover Michigan, Indiana, Illinois, New York, Maryland and Pennsylvania. In addition, restrictions have been placed upon shipments of stock from Ohio. No cattle, sheep or swine can be shipped from these States in interstate commerce and all fodder and animal products of every sort which might possibly convey the disease must be thoroughly disinfected. The quarantined States are not only prohibited from shipping cattle to uninfected areas, but they cannot even send shipments of stock from one infected area to another

Students are enrolled in the Kansas State Agricultural college this Fall, from three foreign countries and 18 States. Japan and China are each represented by one student and Hawaii by two students. The States having students in the college are: Missouri, 44; Nebraska, 21; Oklahoma, 9; Colorado, 7; Texas, 7; Iowa, 6; Arkansas, 6; Illinois, 5; Arizona, 2; Ohio, 2; Wisconsin, 2; South Dakota, 1; Minnesota, 1; Pennsylvania, 1; West Virginia, 1; Idaho, 1, and Massachusetts, 1. The total enrollment of the year has reached 2,702 and is expected to pass the 3,000 mark later in the year.

Among the exhibits at the big "Fenceless Fair" at Atchison, Kan., was a big pumpkin that was sent to the fair by parcel post.

The Missouri College of Agriculture has charge of the total amount of the Smith-Lever funds for the State. The Smith-Lever bill, which was passed by Congress last Spring, gives to the State of Missouri during the coming nine years, for the purpose of demonstration and extension work, a sum of almost eight hundred thousand dollars. This year the State got $10,000 of the appropriation. The College of Agriculture is dividing it among five types of aid for farmers and stockraisers of the State; hog cholera eradication, moveable schools of home economics, boys' and girls' club work, dairy and poultry dmonstration and egg marketing.

The College of Agriculture of the University of Missouri hopes almost entirely to remove hog cholera from the State. To fight the disease it is helping the farmers to organize anti-hog-cholera clubs for the prevention and cure of the disease. The college works by counties. The College of Agriculture is building what will probably be the finest plant for the manufacture of hog cholera serum in the United States. This plant became necessary because of the increased demand for serum. The plant will be finished December 1. The extent of the work done by the College of Agriculture in eradicating the disease is shown by the fact that 208,619 doses of serum representing almost as many hogs treated were sent out by the college during the year.

Joseph W. Ritchie of Freeport, who for twelve years claimed to be the champion pumpkin raiser of Long Island and who took many premiums at the Queens and Nassau agricultural fairs, is dead at the age of 52. He named a number of his productions after prominent men, including Presidents. The largest pumpkin Mr. Richie ever raised weighed 482 pounds. He named it "President Taft." For many years Mr. Ritchie was a prominent baseball player and played with various amateur and semi-professional teams on Long Island.

The steamer Brodmouth is expected to arrive at New York on December 18 from Hong-kong, China, with a cargo of frozen eggs. Before the European war the Brodmouth was employed in the mutton traffic between Australia and England, but when the war broke out an English syndicate contracted for a cargo of frozen eggs for speculative purposes. The cargo consists of 8,800,000 pounds of eggs, all of which are kept below the freezing point. The Brodmouth delivered before sailing from San Francisco on October 29, 1,320,000 pounds of these eggs, leaving a cargo of 7,480,000 pounds to be delivered in New York. The eggs are packed in 10, 20, 30 and 50 pound cans. At the present price of frozen eggs here, 20 cents a pound, the value of the cargo is $1,496,000 and is equal to 6,600,000 dozen eggs in the shell.

Oct. 27. Wheat $1.04; corn $1 per cwt.; oats 46 per bushel; potatoes 45; onions 60; apples 85; Kieffer pears 75; eggs 27; butter 30; butter fat in cream 30. Steers $7 to $8.10; calves $8 to $9.50; hogs $6.75 to $7.25. Turkeys 12; chickens 10; ducks 10; geese 8. G. C. H.
Bowling Green, O.

We are and have been receiving the following prices: Wheat $1.08; Oats 35; corn (ear) 25; hay $10; potatoes 35; grapes, pound, 2; peaches, B, 80 to 100; A $1.25 to $1.65; AA $1.50 to $2.; apples 50 per bu. in small way, poor crop and quality, bulk apples 75 per 100 pounds. Pears, Kieffer 65 per 100 pounds. Eggs 25 to 30, stores pay 25; by shipping to Cleveland 30 to 32 can be obtained. We are doing this. Butter 32; milk per qt. 6; cows $75 to $100; hogs $7 per hundred; cattle steers $7 to $7.50; cows $6 per hundred. W. H. M.
Berlin Heights, Ohio.

METAL roofing is far the most practical because of the protection it affords from fire and lightning. But it must be of the *lasting* kind. Common sheet metal is impure and rusts rapidly. Your roof should be of pure iron—an Armco roof.

ARMCO IRON
Resists Rust

ARMCO—AMERICAN INGOT IRON is not only the purest iron made, but in other respects it is the finest quality of iron produced—that is, it is iron of uniform texture and strength; it is slowly annealed and therefore is free from stresses and strains, which render iron liable to rust.

Armco Iron shows practically no dissolution when dipped into the molten zinc galvanizing. Therefore the galvanizing is purer and will outlast the galvanizing on ordinary iron or steel.

You can get Armco Roofing from hardware stores or tinners. If you have difficulty we will send names of dealers and manufacturers.

FREE Big roofing book, "Iron Roofs that Resist Rust." Shows dozens of styles. Don't roof this fall with material that is bound to rust rapidly. Get this Armco Roofing Book.

The trade mark **ARMCO** carries the assurance that iron bearing that mark is manufactured by The American Rolling Mill Co. with the skill, intelligence and fidelity associated with its products, and hence can be depended upon to possess in the highest degree the merit claimed for it.

MAKE MORE MONEY—DO LESS WORK

YOU need on your farm an engine that starts when you want it to and that keeps going until the work is done. That means EXCELSIOR. Hundreds of farmers who have used the best other makes say they never knew what a real engine could do until they bought the EXCELSIOR, but we do not ask you to take any man's word. We say, "Try the EXCELSIOR on your work without the payment of a cent until you are satisfied that it is what we say—the best running, most durable, and most economical engine you ever saw. If we do not prove that to your satisfaction, send the engine back." You can have the engines on wheels with saw attachment or without or on skids, and we make all sizes from 1½-H. P. up. Tell us the size of your farm and how big an engine you need and get our offer. Write today for catalog and other information.

Concrete for Barn Cellar.

I AM filling in the bottom of our barn cellar with 1½ foot rock and one-half foot gravel, and I am trying to find out how thick a layer of concrete it will need on top of the gravel. This cellar is used for storing manure during the Winter and the concrete must be firm enough to stand u- under a team and manure spreader. What would be the best proportions of cement and clean sharp gravel for such a floor? C. J. B.
Hallowell, Me.

A floor of that character is usually made about four inches thick, this depth of concrete permitting the use of a considerable number of good-sized stones in the gravel and saving a proportionate amount of cement. These stones, whether those naturally occurring in the gravel or placed in the concrete as it is put down, should not be allowed to come within less than one inch of the surface, however. With clean, sharp, gravel holding a certain amount of sand as it is taken from the bank a mixture of one part Portland cement to seven parts of gravel should give a sufficiently rich mixture. The standard mixture for barn floors, as commonly advised, is one part cement, two and one-half parts sand and five parts of gravel and if one is doubtful about the results he can screen the sand from his gravel and mix them again in definite proportions. This is by no means always done, however, and the natural bank mixture of sand and gravel may easily be tested by mixing a small batch and waiting twenty-four hours to see whether it sets hard or not. M. B. D.

Tile for Sub-irrigation.

I HAVE been growing strawberries for 50 years, and during that time there have been several seasons that excessively dry weather has materially interfered with my success. Both this year and last we have had distressing droughts, notwithstanding I am in as good a part of the great State of Illinois as there is. Neither year have we had half an average annual rainfall. Strawberry plants put out in April died in spite of all the watering I could do, until I have not more than 10 per cent. living out of all I planted. I want some information about sub-irrigation. I want to start with a plot of ground 30x60. I expect to plant eight rows, the whole 60 feet in length. How shall I sub-irrigate this plot of ground? I had thought that if I put a line of tile under each row of plants that would be sufficient. In the run of the 60 feet there is a fall of 2½ feet. The soil is a black friable loam. It is as good soil as can be found. We have in our town a large factory of drain tile which I can buy at a reasonable price. The tile I should use is the kind that just butts up end to end, and hence there is always opportunity for water to run either out or in at every joint. The tiles are just a foot long. Would it do to put a row of three-inch tile under each row of plants, or would it be better to put a row on each side of each row of plants? This would take twice as many tiles, but I do not care for that if it is better to do that. The tiles I would use have a round three-inch hole. I presume that is larger than needed for so small a plant as I am considering. The water I shall use will come from our city water system, and I would run it into each row of tiles at the highest point and let it flow by gravity to the other end. I would use only a ¾-inch hose to conduct the water to each pipe. How deep should the tile be laid for best results? L. B. C.
Illinois.

It would seem to me that you are planning a very expensive method for irrigation, especially with city water. You would need a head line of tiles across the upper end of the plot so that the water could run into the whole system at once, and a line of three-inch tiles down the middle between the rows would be enough, having of course the lower ends stopped. But then you would have a permanent arrangement for that plot only, and strawberries need frequent replanting. To irrigate in this way every plot planted would be very expensive, especially as the succeeding crops may be such as would not thrive with sub-irrigation as well as overhead. I think that it will be far cheaper and as effective to use one of the overhead systems, which can be extended or moved at will. There are three of these, the Skinner, the Manaway and the Campbell, all good. In this method of irrigation the perforated pipes are run overhead and have specially designed nozzles for spraying, and one line of pipe will water a width of 40 feet. In fact the Campbell system claims that 50 feet apart are sufficient for their rotating nozzles. The overhead systems are put high enough to work teams under, and can be moved easily to other plots or expanded over more ground. They will take less water than the underground tiles, which are not effective till completely filled. Another advantage in the overhead plan is that in the early Spring, when frost threatens, you can turn on the water and spray all night and prevent damage from frost. Large growers of strawberry plants for sale are now using the overhead system. Sub-irrigation may do very well in greenhouses, but in the open ground the underground system of tiles will cost as much as or more than the overhead piping, and will take a quantity of water that would make it very expensive to use city water, and could only be made economical where one could have a natural flow of water. One line of pipe suffices for my garden 50 feet wide, and adds but $1 a month to water rent.

W. F. MASSEY.

Water Flows Both Ways.

THE Geological Survey gives the following singular facts:

"In Northern Minnesota there is a great area of land so flat that its waters sometimes flow into Hudson Bay and sometimes into the Gulf of Mexico. There are times when certain lakes discharge at both ends, the northern outlet carrying water through Red River or Rainy River to Lake Winnipeg and thence to Hudson Bay, while the southern outlet carries water to the Mississippi. Because the dividing line between the Mississippi River drainage basin and that of Hudson Bay is indefinite and in many places cannot be determined, the consideration of these two basins in connection with their water supplies and the uses that can be made of this resource must logically be taken up together."

Septic Tank.

I wish to construct a septic tank for sewage disposal on the farm. Do I need water connections to flush out bowl of closet after use? W. N. M.
Ohio.

Septic tanks require water connections of some kind to flush closet bowls and carry the wastes from sinks, wash basins, etc., to them. Where running water is not at hand, large storage tanks to be supplied from the roof may be built in the attic. There is a type of small septic tank designed to receive its supply of water from the kitchen sink where water is used freely there. This is described in a bulletin entitled "Sewage Disposal for Country Homes" issued from the College of Agriculture at Cornell University, Ithaca, N. Y. A copious supply of water is needed for the operation of a septic tank, as it depends upon frequent flushing to dispose of the wastes after they are digested in the tank. M. B. D.

VERY black, very small and very much impressed with the importance of her mission, she stood before the kindly lady of the house. "Well, Ophelia?" "I's de washerwoman's little girl and mommer she says please to len' her a dime. She got to pay some bills."—Kansas City Star.

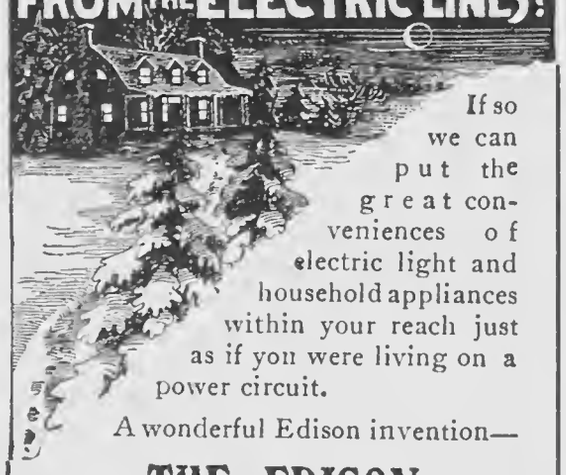
IS YOUR FARM AWAY FROM THE ELECTRIC LINES?



If so we can put the great conveniences of electric light and household appliances within your reach just as if you were living on a power circuit.

A wonderful Edison invention—

THE EDISON STORAGE BATTERY

gives you your own electric light and power plant—economical, efficient, trouble-proof. Reduces fire hazard.

It is composed of nickel-iron parts in alkaline solution instead of the ordinary lead plates in acid solution.

It will therefore do its work much more satisfactorily, and it's the only battery with a long-time guarantee.

Mail coupon shown below. It entitles you to valuable free information about the Edison Electric Lighting Plant.

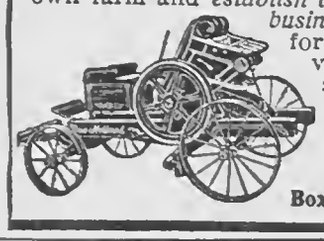
New Holland
Stone Crusher

The finest machine made for crushing all kinds of rock for road making or concrete work. Easiest running and most durable. *Equipped with Pulverizer to grind rock fine for building and land purposes.* A money maker for contractors or farmers having 4 to 12 h. p. A chance to increase value of your own farm and *establish a big money making business.* Write today for catalog, facts as to value of raw limestone on land, and *free trial offer.*



NEW HOLLAND MACHINE CO.
Box 41, New Holland, Pa.

Ground Limestone 50c Per Ton

The day of cheaper lime is here. No need to let your soil stay sick and sour because of the lack of lime if you have lime rock available. No need to let acid land keep you from growing clover or alfalfa. With a Jeffrey Lime Pulver you can grind lime-rock right on your farm at a cost of 50c per ton! This does not include quarrying cost, which varies, but in some sections is almost nothing. Ground limestone is better than burnt lime. It doesn't burn up the humus or waste the Nitrogen in the soil.

Dig out those lime rocks that prevent your cultivating your fields. Feed the rocks to the Lime-Pulver, as large as you choose—any size up to 4 inches thick and 11 inches long. The rocks disappear in the hopper. Out of the funnel pours a stream of ground limestone—ground either coarse or fine. It's like turning rocks into dollars—"making bread from stones."

Grinds 2 to 3 Tons Per Hour
Grinds Rock for Road Work Too!

Home Grinding of Limestone PAYS!

A 2 in 1 Crusher and Pulverizer Grinds the Big Rocks—Big Capacity

The Jeffrey Lime-Pulver is the machine that will take the big rocks that come from the quarry and grind them to a powder that will go through the spreader. It is both a crusher and a pulverizer—with twice the capacity of other crushers. Grinds from 2 to 3 tons per hour. Grinds rock for road work and concrete work—grinds corn on the cob, tobacco stems, bone or any similar material—a universal grinder, portable—as easily moved from place to place as a wagon. Built to last a lifetime—with pulverizing hammers of Manganese steel—ball bearing pulverizer. Sold on a guarantee of satisfaction or your money back. Write us today for our free booklet giving price and full information about the Lime-Pulver. Write NOW.

The Jeffrey Lime-Pulver

Hope Farm Notes

A CLOSE RACE.—I went up to the Connecticut Agricultural College at the end of October to see the old egg-laying contest end and the new one begin. The chief excitement was over the close race between Barron's English Wyandottes and Lincoln's American Leghorns. The Americans went far ahead in September, but then the Wyandottes began to gain. Egg by egg they gained until with only eight days to go they were but six eggs behind. It looked as if they would win, but somehow they faltered on the home stretch and the Leghorns won by three eggs. The final score for one year—10 hens—was:

Lincoln's American Leghorns	2,088
Barron's English Wyandottes	2,085
Experiment Pen, Leghorns	2,083
Barron's English Leghorns	2,010
Neal Bros., Wyandottes	1,918
Merrythought Farm, Wyandottes	1,901
A. B. Brundage, R. I. Red	1,885

The other pens all fell below 1,800 eggs. A little later we shall be able to tell how much feed these hens consumed, the weight of their eggs, the cost and the income—figured at prices received month by month. It surely was a great race. We have partly succeeded in our ambition to make these contests as interesting to hen men as baseball or football are to the general public. Thousands of farmers are following these egg contests, and the interest has hardly begun.

A NEW CONTEST.—Saturday, October 31, was a lively day at Storrs. There were 820 birds to be taken from the houses and shipped to the owners, and 1,000 birds to be sorted, identified and properly distributed in 100 houses. All these houses were cleaned, sanded, sprayed and re-marked. It all meant the prompt and careful handling of 209 packages, for our "Favorite Hens" came in 30 different boxes. Most of these packages were handled from Willimantic, some nine miles away. This will give an idea of the labor and the accuracy required to organize and start such a contest. Add to this the fact that each hen must be carefully examined for disease or insects and treated if need be. Briefly stated, there are 50 houses each 12 x 12 feet, divided into two compartments, each holding 10 hens. There are five trapnests in each compartment and an outside run. Each hen wears a numbered legband, and individual records are kept. The hens remain in this house one full year—all being fed the same ration. The following dry mash mixture is kept before them at all times. They help themselves at will:

Coarse wheat bran	200	pounds
Cornmeal	100	"
Gluten feed	100	"
Ground oats	100	"
Standard middlings	75	"
Fish scrap	30	"
Beef scrap	30	"
Low grade flour	25	"

There are little boxes holding grit, shells and charcoal which the hens take as they like. There is also provided a "scratch grain" made up as follows:

Cracked corn	60	pounds
Wheat	60	"
Heavy white oats	40	"
Barley	20	"
Kafir corn	10	"
Buckwheat	10	"
Coarse beef scrap	10	"

Formerly this was fed in an automatic feeder operated by the hens. An experienced man is better than any hopper, and so the scratch feed is now thrown out by hand as needed. It is scattered in the litter, where the hens work for it. Green food is also given in the form of mangels or other vegetables. All the hens are treated alike and this seems as fair a system as could be devised. We have heard Leghorn men say this system favors the Wyandottes, while Wyandotte men say it favors the Leghorns. As a matter of fact the Leghorns won the contest, while the highest individual scores were made by Wyandottes!

NEW FEATURES.—These are houses for 100 pens. All are taken and half a dozen more could have been used. A number of new breeds appear this year. Black Leghorns come from England. There is a pen of good Buttercups—looking like quick, active game birds. The Light Sussex has the head and neck of a Light Brahma with clean legs and something of Orpington shape. The Faverolles wear whiskers, and are certainly much lauded by friends. The Connecticut Station has entered two pens of Light Brahmas. One will be fed meat in the dry mash—the other sour milk substituted for the meat. The old American Dominique is represented, and also the Black Langshan, while one of the "Favorite hens" is a good Black Minorca.

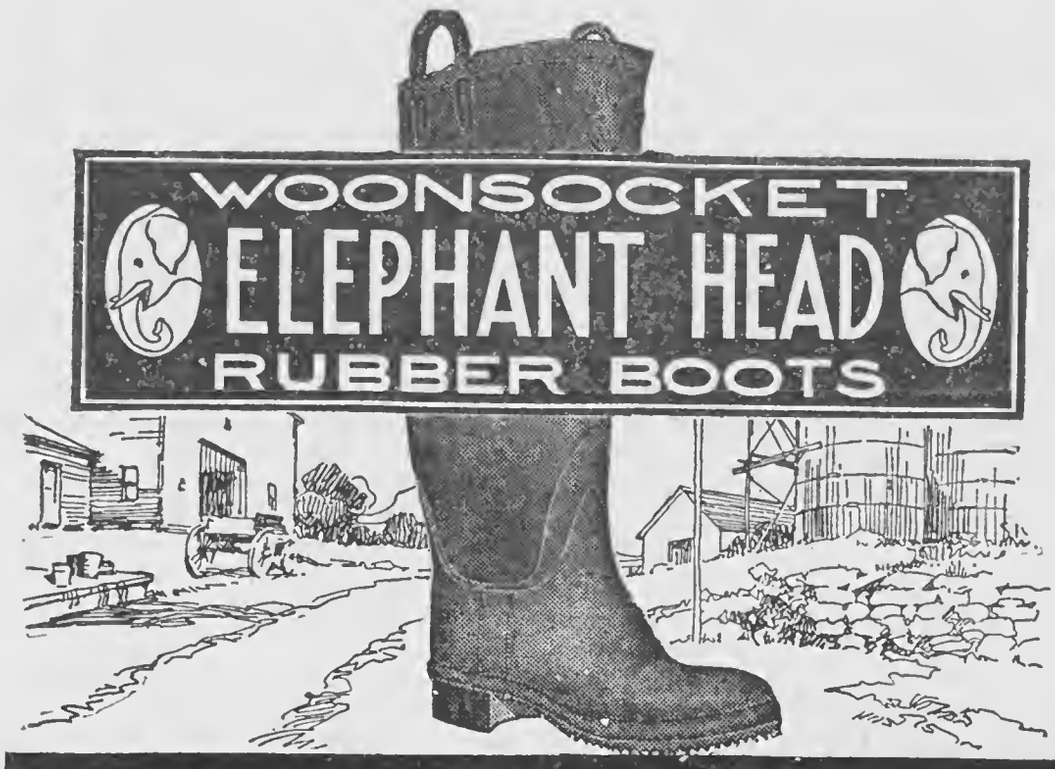
THE FAVORITE HENS.—I found these 30 birds all sorted into their houses ready to begin the year. There are 10 Leghorns, 10 R. I. Reds, four White Wyandottes, three Barred Rocks, two Buff Orpingtons and one Black Minorca. These birds come from 30 different farms and were selected by 30 different people—therefore we would naturally expect varying types of birds. Most of them are good specimens, and I expect several of them to make good records. I hope to have them all scored while they are here, so that we may see how they rank as show poultry as well as layers. I should say that the Black Minorca, one of the Barred Rocks and two or three each of the Reds and Leghorns are more than good. We shall give the individual records of these birds month by month. A few of them look as if they would start laying at once—the others are not ready yet. One bird laid an egg the first day!

THE HOPE FARM "HENS."—Call them "scrubs" or culls as you like. They ended the year's performance as follows:

			No. of Eggs
No.	1.	B. Rock	91
No.	2.	W. Leghorn	142
No.	3.	B. Rock	107
No.	4.	Mongrel	100
No.	5.	B. Rock	127
No.	6.	Mongrel	127
No.	7.	Barred Rock	79
No.	8.	Mongrel	141
No.	9.	White Leghorn	190
No.	10.	White Leghorn	114

Including the eggs laid outside the nest these hens laid a total of 1,287 eggs—as we see, an average of 10 dozen and eight. There were 18 pens of pure bloods below them. I shall have the total amount of their grain and its cost later, but the average cost of feeding a hen in this contest is not far from $1.75. On that basis you will see that my No. 7 was a pure drone, while No. 9 was a great worker. At least three of these birds barely paid for their feed, and under ordinary farm conditions I think it doubtful if they would average 60 eggs per year. Seven of them were evidently culls and discards fro. ordinary farm flocks. I doubt if we could get seven birds more typical of the hens which a farmer ought not to keep—if we accept the teachings of the wise men—I did not expect these seven birds would average 75 each. They were in desperately poor condition to begin with—right out of the live poultry market. All with bad colds. When they came to the contest these birds were so poor that they averaged only 3.2 pounds in weight. In May they averaged five pounds. Most of them hardly began to lay before March. A little later I will try to bring out some of the lessons which I think this pen has taught. I hoped these birds would hold out and lay 1,300 eggs after their good performance in Summer, but they lacked the staying qualities, and I lose by 13 eggs. The Hope Farm man is a good loser, and I have no word of fault to find with the hens. I think even No. 7 did her best, and it was the fault of her ancestors that this best was no better.

ANOTHER TRIAL.—Instead of finding fault I will back the 10 Hope Farm "hens" for another trial. They are to be tested another year at Storrs. As we shall breed them they will be kept outside the regular contest plant, but otherwise their treatment will be the same. The plan is to breed them to as poor a dunghill rooster as we can find, and also to a finely-bred utility Leghorn. If possible we shall raise 10 pullets from each cross, and enter them as two pens in the next contest, the object being to see how much difference will be shown by the two matings. Now these birds laid 1,287 eggs in their pullet year. To show what I think of them I will now, at the opening of the contest, back them to lay 1,400 eggs before Nov. 1, 1915. Here is a good chance for some of the wise men who lay down the poultry laws to make good on their statements that pullets cannot "come back," and poor blood fails. H. W. C.



For Hard Work in Winter, Rubber Boots Are the Things

Cutting ice, shovelling snow, watering and feeding stock, hauling wood, are all hard work in winter weather.

Why not make it easier by wearing good, solid, comfortable, warm ELEPHANT HEAD RUBBER BOOTS?

ELEPHANT HEAD RUBBER BOOTS are made of the very highest quality pure gum rubber and selected, tested duck. They are reinforced at every point where the strain comes and lined with soft, warm wool.

Drive to a dealer's today and buy a pair of these durable, comfortable boots.

All the better dealers sell ELEPHANT HEAD RUBBER BOOTS. You can depend on anything you buy in the stores that have them.

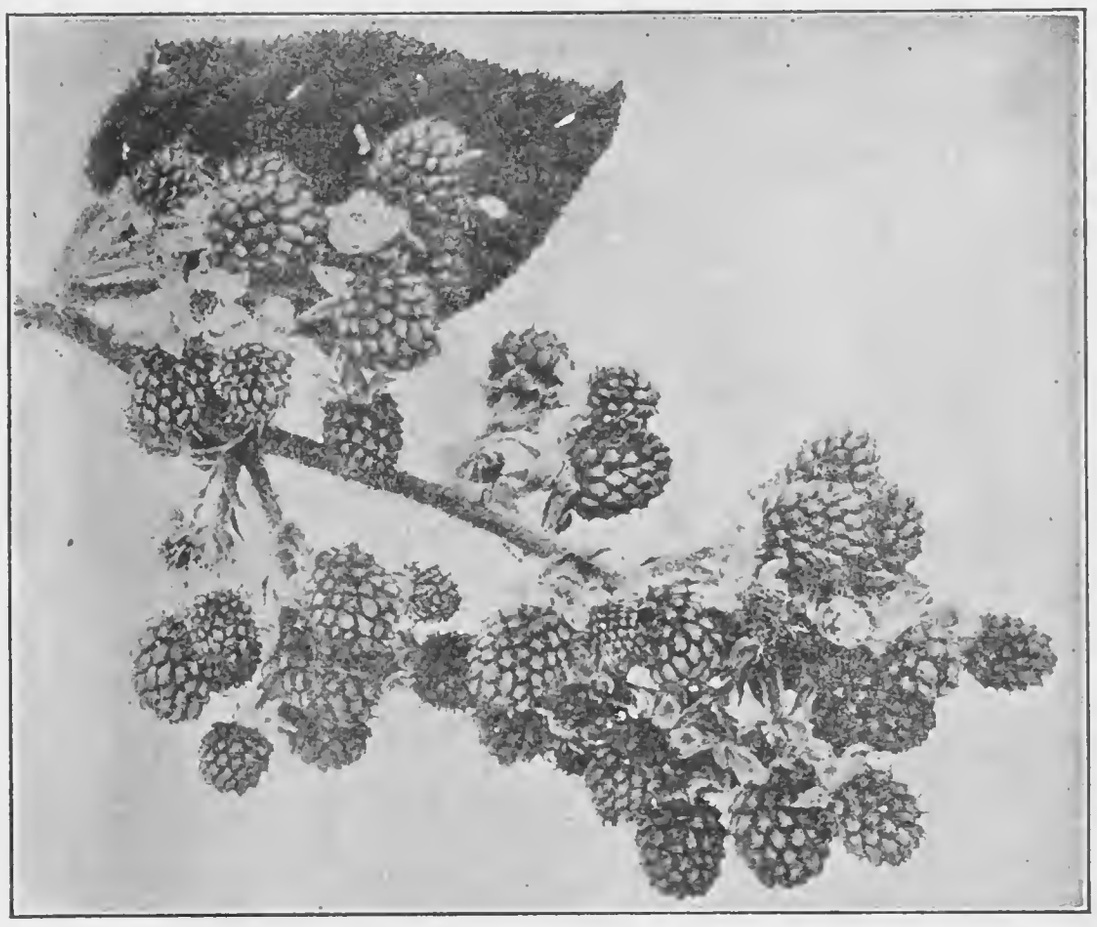
A GREEN RASPBERRY.

THE raspberry shown in Fig. 583, Rubus Brasiliensis, was collected in the Highlands of Minas Geraes, Brazil, by the Dorsett, Shamel and Popenoe Expedition this year; the picture is reproduced from Bulletin 99 of the Office of Foreign Seed and Plant Introduction. The fruits are described as translucent yellowish green when ripe, sweet and agreeable, but rather seedy. It is called by the natives amora, a name which properly belongs to the mulberry, but is also applied to the strawberry-raspberry, Rubus rosæfolius. It is suggested that this odd fruit may be of interest and value to breeders of rubiaceous fruits. We infer that the plant would be tender where the Winters are severe.



A GREEN-FRUITED RUBUS FROM BRAZIL. FIG. 583.

MORE ABOUT BRASSINGTON CHERRY.

ON page 1213 of your paper J. T. S., Waynesburg, Ohio, asks about the Brassington cherry. It seems strange that Mr. Van Deman is not acquainted with this most valuable cherry. I planted over a hundred cherry trees about 10 years ago and among them were about 10 or 12 Early Richmond, seven Baldwin, three Brassington and 12 May Duke, also 35 Montmorency. The remainder of the planting was of about six kinds of sweet cherries. The Brassington was to be earlier than the Early Richmond but with me it comes the same time; in fact I hardly ever know which to pick first. It is far ahead of any other sour cherry I ever saw. A beautiful, upright grower, and when in bloom it is the most ornamental of all cherry trees. The fruit is wonderfully large and a beautiful red color, about the same as a May Duke, and the most productive cherry I ever heard of. I would willingly give $25 each if I could replace my Early Richmond trees with Brassington of the same size. I propagated a lot of the trees and set out about 20 of them last year. I will also state that it is just sour enough to be good. It is just as far ahead of Early Richmond as a Whitney crab apple is ahead of a wild crab found in the woods.

Barberton, Ohio. I. L.

When the question was asked about the "Brashington" cherry I had never heard of it, and said so in my reply, but did not expect so prompt and clear a response as we have here, although I had hoped that someone would tell us about the variety. If the present grower of it knows the origin and the true name, be it spelled "Brassington" (as he has it) or otherwise, let us have it. As he claims it to be a very superior sour variety it may become a successful rival to those we now have, and of this we should all be glad. The cherry under discussion is probably one of the Duke class, and not a true sour Morello or Amarelle, as the Richmond and Montmorency are.

H. E. VAN DEMAN.

"DID the doctor limit you to any particular diet?" "No, but his bill did."—Birmingham Age-Herald.

NEW PLANT INTRODUCTIONS.

AMONG plants listed in Bulletin 99 of the Office of Foreign Seed and Plant Introduction is Allium schœnoprasum, a superior variety of chives from Sianfu, Shensi, China. These are forced in darkness and used as a Winter vegetable.

More varieties of the Chinese cabbage, or pai-tsai, are being introduced through the Bureau. One called in China "Ta pai-tsai." or "large white vegetable," is described as remarkably fine, very white, with a mild sweet flavor. Another conical in shape, is greenish white, very soft and tasteful when boiled or stewed. In our own garden, while the pai-tsai grew very vigorously, it seemed peculiarly attractive to the flea-beetle, which attacked it in preference to anything else. Hens seemed particularly fond of the Chinese cabbage.

Seed of 13 varieties of Job's tears (Coix) have been received from Burma, where they are used as flour and food grains. These are to be used in the Office of Forage Crop Investigations.

A new carrot from Sianfu, Shensi, China, is described as a long blood-red carrot that is used for pickling; its Chinese name is "Hong tiao lo ba," meaning "red stick root."

White Turkestan barley, presented by the Director of the Yaqui Valley (Mexico) Experiment Station, is described as especially suited to the arid irrigated districts of the Southwest. It is very vigorous and hardy, with robust germinating quality. The seed was collected at Merv, Transcaspia, in 1911. It is quick in growth and three weeks earlier in maturing than the common six-rowed California barley, but a tendency to rust renders it undesirable for the sea coast, where it would be exposed to fog.

A Home Water Works!
Running water when and where you want it. For your country home—farm, garden, lawn. Water pumped from nearby stream, pond or spring without expense of power. Low in cost; high in efficiency. Thousands of these FOSTER High Duty Ram Pumps now in use. Write today for all facts.
POWER SPECIALTY CO., 111 Trinity Bldg., New York

Don't Neglect Fall Spraying **"SCALECIDE"** Fall Spraying is Best
TRADE MARK REG. U. S. PAT. OFF.

"Scalecide" will positively destroy San Jose, Cottony Maple Scale, Pear Psylla, etc., without injury to the trees. Endorsed by Experiment Stations.

Our booklet, "Scalecide, the Tree Saver" proves our every assertion. Mailed free. B. G. Pratt Co., Dept. "N", 50 Church Street, New York City.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York
HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates, 75 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. We use every possible precaution and admit the advertising of reliable houses only. But to make doubly sure, we will make good any loss to paid subscribers sustained by trusting any deliberate swindler, irresponsible advertisers or misleading advertisements in our columns, and any such swindler will be publicly exposed. We are also often called upon to adjust differences or mistakes between our subscribers and honest, responsible houses, whether advertisers or not. We willingly use our good offices to this end, but such cases should not be confused with dishonest transactions. We protect subscribers against rogues, but we will not be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and to identify it, you should mention THE RURAL NEW-YORKER when writing the advertiser.

IN the new egg-laying contest just starting at Storrs an English breeder entered a pen of Wyandottes. It was necessary to cable about them, and all messages must be sent subject to the military censor. This message was held up and the breeder asked to explain the meaning of the word "Wyandotte" before it could proceed. This will indicate the feeling in England, and the strict supervision of the army officials. Any new or strange word or phrase is regarded with suspicion. They probably thought "Wyandotte" stood for some new explosive. It seems to. The record and shape of these English Wyandottes have certainly exploded a lot of old, comfortable notions about "ideal" birds.

*

A "FREE school of poultry judging" will be held at the Kansas Agricultural College in late December, in connection with a poultry show. "This show will not be judged in the ordinary way, where the judges walk down the aisles and place the ribbons, no one knows how or why. Instead the judging will be done upon a platform, surrounded by comfortable chairs, where those interested may see everything that is done, and ask questions. Instead of looking like a Chinese puzzle to the uninitiated, every award in the entire show will be carefully explained in detail." That is good. The "Chinese puzzle" business has had its day in the show ring. Fine points and eggs do not always agree. It is now suggested that all the birds entered at the egg contest should be "scored" at the beginning, and thus see how shape compares with performance.

*

WE have an ambition to help make these egg-laying contests occupy as lively a place in the popular mind as baseball, football or similar sports. Few things really climb into popular favor until in some way you can make them appeal to a person's imagination or "sporting" spirit. Certainly the egg race just ended at Storrs was as close and exciting as any horse race or ball game. The victory of the American Leghorns is a popular one. Mr. Lincoln is not one of the "big" breeders, but a young man who has only done what hundreds of other bright young fellows can do and surely will do. It means something to win such a contest. Lincoln's 10 hens will now give large interest on a valuation of $1,000. At the Thorndale contest a single hen laid 285 eggs in one year, and the owner has been offered $500 for her! In fact these contests are creating an "advanced registry" for hens by giving them a certificate of official record. After a few generations of breeding from these public record-makers, pedigreed hens will be regarded much as pedigreed cows are now. The fanciers with their idolatry of "fuss and feathers" may sneer at these contests. That is their privilege, but the public prefer eggs to sneers.

*

MOST back-to-the-landers fail through lack of money. They usually give a heavy mortgage, which runs three or five years. Even if they keep up the interest they cannot pay the principal when it comes due, and at the same time invest capital in the farm. Without fair capital they cannot hope to pay the mortgage. So when it comes due they become discouraged and sell out or let the farm go. This is done sometimes—even when the holder of the mortgage would be willing to renew it. The fear that it may be foreclosed haunts the farmer and makes him timid about working the farm properly. We have seen several cases of this sort when if the farmer could have had some different system of payments he could have planned to improve the farm slowly and finally pay out. The new Land Bank will offer just such opportunity to hundreds of farmers. There will be small and gradual payments of the principal extending over 20 years or more. A man can plan to meet these small yearly payments and still provide a little money for drainage, breeding stock or other improvements which are really investments. Such a man will not fear foreclosure, but he can go ahead and plan with confidence for the future. In our own acquaintance we know of at least half a dozen families who failed under the old system, yet might have made good under the plan proposed by the land bank. Under the old plan the mortgage is always master of the man—the new plan gives the man a chance to master the mortgage.

*

SOME time ago, in an argument in your columns, a cow man volunteered to take a hen man's 10 cows and pay him a good percentage, taking out his wages and cost of keep, etc., from the milk bills. Could men be found to take charge of a farm of good size, stocked and machined, and guarantee to make their wages and a fair percentage for the owner? I know of several (city men) farmers like myself who I believe would be glad to get such a man, and would use him a little more than fair if he would do the same by them. S. R.

Why not? Why should not the man who assumes to act as manager take some of the risk—along with the man who puts up the farm, the equipment and the capital? Give us a reason why the man who expects to be well paid for "managing" a farm should not be willing to prove his ability by taking his chances on a guarantee that he can make wages and a profit. Why should he take charge of the farm otherwise? What should he require of the owner in order to give this guarantee? These questions are submitted to the men who solicit jobs at managing. The answers, freely given, will get down to the core.

*

CHARLES S. WHITMAN is to be the next Governor of New York. In this Republic all sensible people recognize the power of the majority. The voters of the State called Judge Whitman to the chair in italics—there is no question about their choice. Great opportunities await Judge Whitman at Albany. The great party which elected him has apparently had its lesson and the split of two years ago seems to have been bolted together. There are also more truly independent voters in the country than ever before. Judge Whitman's party is seeking for a great leader—a man with the courage and the character of Gov. Chas. E. Hughes. In the need of such a great reform leader and in the peculiar circumstances of this election lie the elements which give the opportunity to Judge Whitman. He must realize that he was elected by the votes of farmers and country people—and he must look to this solid and conservative class of citizens for future support. Gov. Glynn and the last Legislature (the Assembly being Republican) gave us four laws which are to have great influence upon the future of New York farming. The most important of these is the law creating the Land Bank. This law was demanded by the best farmers in the State—not as a political measure, but as far-sighted and greatly-needed legislation—not to benefit any party, but to give New York farmers a better chance to obtain fair and needed credit. It is reported that Judge Whitman criticizes this law, and what it seeks to accomplish. We believe this criticism is based upon a hasty reading of the law. When Judge Whitman has full opportunity for studying the law and the help that similar legislation has been to European farmers, we are confident that he will recognize its value and purpose and realize the value of the system to our New York farmers. After a full, understanding study of this legislation we believe that Judge Whitman will realize the need and the sincere demand for it, and become one of the warmest supporters of the Land Bank.

*

HE will be a fool to buy even here without first coming to see the country. Farms within a mile of our own we would not take as a gift, and yet the adjoining farms are very prosperous and the owners have become well off, but these particular farms could never be made anything, not even a goat pasture. One farm within six or eight miles of this city will not grow weeds, it is a light sand which blows like snow, and yet farms adjoining are the best ever. How are you going to prevent a man getting caught on such land if he does not come and see it? The real estate agent might not deceive in one single statement, and yet he would be burning his money if he put it into such farms. C. I.

No, the land here mentioned is not in Florida or California, but right here in New York State. The same story might truthfully be told of any county in the country. This man lays down a large, solid chunk of gospel truth about real estate when he says that a buyer should come and see the land before buying. We cannot think of a more foolish thing than locating a *home* for the family on some unknown and unseen spot in order to save the expense of fair investigation. We have been criticized for taking this position. "Do not interfere with the sale of real estate," these critics say. "Get all the new settlers you can; it is not your business to frighten them away or care if they are not satisfied." A very short-sighted policy that. New York does not want any dissatisfied immigrants. They simply become what are known as "knockers," and there are too many such now. We want to see the farms of New York occupied by contented and prosperous people. There are good opportunities here, but the man must fit the farm in order to make a true combination and so—North, South, East or West—our advice is to see the land and study it before buying.

*

EVER come back after 20 years and see the slender little "best girl" of boyhood grown to a broad, substantial lady ordering a large household about? Ever see a tiny baby in a cradle and after a score of years see it grown to a great giant, smashing through a football team? If so, you may realize how some of the old-timers who helped organize the New York State Fruit Growers' Association feel at its latest announcement. The next meeting will be held at Rochester, January 6, 7, 8 of next year. When the society went to the great convention hall for its meeting, a few years ago, there were those who said it would rattle around like a dry pea in a pod. There was no rattling, and now even this great building is too small, and the society goes to Exposition Park, in order to find room. When this society started it was puny and small. It had a struggle for a few years, but it has had the advantage of being directed by a group of thoroughly honest, capable and patriotic men, who have gone down into their own pockets when necessary, and "boosted" without self-advertising or glory. We mean men like Senator Thomas B. Wilson, Secretary E. C. Gillette, President L. L. Morrell, ex-President Clark Allis and scores of others who should be mentioned. We may safely state that every man who grows and sells fruit in New York has been benefited because this society has grown strong and influential. We think the managers of the New York State Fruit Growers have set us all an example of how to do things and help farmers.

*

SOME farmers here claim that the acid in silage and apple pomace causes the cow's teeth to fall out. Is it true? E. H.

No! This charge has been made repeatedly but cannot be demonstrated, and the use of silage is rapidly increasing. The teeth of all cows are loose and easily knocked out or broken off. Enemies of corn silage, or those who have not studied its value and use often state that this feed loosens the front teeth and causes them to drop out. They blame this to the acid. The accusation is wrong. Thousands upon thousands of successful farmers have for many years fed corn silage and would not do so were this feed to cause trouble such as that mentioned. We do not believe there is any more danger in feeding apple pomace. One trouble about many of such things is that people jump at conclusions. Not long ago we met a farmer who said he was ready to swear that large-sized cinders, full of fire, came out of a passing automobile and set the grass by the side of the road on fire. He would swear to it because he saw the glowing cinders thrown from the car at night and saw the burning grass! Therefore he said all cars were dangerous and should not be permitted to come into a yard or barn! On hunting the matter up we found that a man riding in the car had thrown out his half-used cigar. It was alight and glowing, and it had started the burning grass! This farmer saw the cigar coming from the car and jumped to the conclusion that all cars will "spit out red cinders as large as a marble." We have seen many so-called "facts" which had no better foundation than this "red cinder."

BREVITIES.

No man can make his business throb unless he stays right on the job.

"GOING light" is a disease which, at this season, often attacks poultry and pocketbooks.

APPLE packing school at the Massachusetts Agricultural College, Amherst, Nov. 18-24.

NOW we have warning not to use Dwarf Essex rape as a cover crop in an orchard. It is claimed that aphis develop on the rape and spread to the trees. Can anyone give experience?

WE would like to hear of any local live stock clubs. Clubs are being formed in counties or townships to promote the interests of some breed or type of live stock. It is a good plan—tell us about it.

"TELL the subscriber who 'has the sparrows,' on page 1280 that a Roman candle fired into the trees just at roosting time two or three consecutive evenings will rid him of the nuisance," says A. M. H.

A NEW one in the line of newspaper frauds. This one offers to send the bulletins of the experiment station free as a premium for his paper. These bulletins are free to any farmer in the State anyway, and no agent has the right to promise them.

YOU want to remember that making a concrete block is something beside throwing sand and cement together and watering it. Brains too. A streak of pure sand through a man will make him stick. Such a streak of unmixed sand in a concrete block will make it crumble.

Digging and Storing Potatoes.

CELLAR STORAGE.—The late varieties of potatoes are comparatively easy to keep in cellar, but with early varieties, like Irish Cobbler, which seem in a great hurry to get started to grow, more care is necessary where stored for seed, if one wishes to keep them dormant. A large unventilated bulk of potatoes stored in cellar, even though they are well matured and put in dry, will sweat, and potatoes on top of pile will show dampness. As this continues all through the Winter regardless of low temperature and ventilation, the early varieties begin to sprout badly down underneath, by mid-Winter sometimes, and by Spring, unless attended to, one finds them in poor condition. When the cellar is partitioned off into narrow bins, with well-ventilated sides, this trouble is avoided, but in putting in 2,000 to 3,000 bushels of one variety, all in one pile or bin, we have been able to bring through in fine condition, by simply leaving boards against the walls and then placing old berry crates, peach carriers, or broken ⅝ truck baskets, frequently through the pile, standing them on end and reaching from cellar floor to top of pile. Our aim in keeping seed potatoes dormant, has been to keep them cool, as safe and as dry as possible. We prefer to have them well below 40 degrees much of the time. We are following the same plan now in storing late potatoes we are holding for better prices.

SOIL ACCUMULATION.—One does not realize the amount of soil carried from the field to cellar on potatoes, even when handled in dry weather. This makes but little difference where pile is built from the side, but where large quantities are poured down from overhead, in one place, the accumulation makes trouble, and in such places potatoes sprout badly. Where this method of filling cellar is followed, the potatoes should be dumped above first and then forked into the hole, leaving most of the dirt separate, but at best the plan is a poor one. As it is not always possible to select dry weather to handle the potatoes, as one writer suggests, especially during such a Fall as we have been having this year, at such a time, the wet potatoes should be spread on barn floor or other safe place temporarily, and then stored when dry.

LATE DIGGING.—Late potato digging has been hindered here this Fall by cold wet weather recently. One grower tells of working all day in bad storm and then allowed a load of 50 or 60 bushels of the wet potatoes to stand exposed to cold, that were frozen so stiff the next morning it was impossible to dislodge them from the crates when thrown from the top of load to the ground. Being so wet and dirty they froze together very easily, but apparently without much injury, as but five bushels out of the load were rejected at the car when thawed out, but would not care to be the buyer at the other end of the deal.

DIGGING METHODS.—Trucker, Jr., mentions different methods of digging potatoes. Potato growers know only too well the difficulties to be met at times in getting the big diggers to work under unfavorable conditions, such as wet soil, crabgrass (in New Jersey) or injury to immature tubers in early digging. We understood that buyers here this Fall refused to take digger dug stock early in season, and it was a common thing to see men digging by hand while their big expensive diggers stood idle. Diggers all have their advantages and likewise points that are otherwise. We ran upon a plan that might interest growers who wish to dig seed by hand, selecting hills as they go, also in digging before ripe enough to handle with the digger in the usual way. We have one of the cheaper, simpler makes of diggers, and we simply remove the shaker entirely under such conditions, running the blade under the row, like a tree digger, which lifts and loosens the soil leaving the hill intact, and very easily and quickly removed with ordinary potato hook, or if digging is done early, while tops are green, potatoes hang to the vines and one can more easily and more quickly remove by hand than by the common method of "scratching out" by hand behind the plow, as has been so much practiced in New Jersey, when dug for early market. Any of the cheaper makes of diggers so built as to run blade under the row should answer for this work, by simply removing the attachments intended to separate the tubers from the soil. Aside from the labor saved in selecting hills, when dug for seed, and the better condition of the potatoes when dug early, the labor saved in gathering the potatoes into baskets is quite an item, where two or more rows are thrown together. In scratching out by hand behind the plow I think the Jersey growers who follow this plan early, will admit that there is much gain in picking over that of following the digger excepting under the most favorable conditions.

THE CROP.—It has been a very favorable season here for potatoes and the crop is much heavier than usual. Potatoes generally very large and coarse where grown in hills, many of them hollow. One buyer, we understand, has eight bushels taken out as too large, about 30 potatoes to the bushel crate. Rot is very bad in some places. One grower took a load to car of about 50 bushels and buyer accepted only seven bushels out of the load at 30 cents per bushel. We hear of their selling at one station at 15 cents per bushel a few weeks ago. Thousands of bushels are being stored.

Livingston Co., N. Y. ISAAC C. ROGERS.

The Apple Grading Law.

WHY ENACTED.—Chapter 418 of the Laws of 1914, commonly known as the Apple Grading Law, was enacted for a very definite purpose. Buyers of apples in large quantities usually were obliged to purchase them unopened, with the exception of a few that were inspected as samples. They frequently found that the goods contained were not as represented. Occasionally the fault would consist in inserting cull apples in the center of the barrel, while those at the ends would be of the quality indicated by the marking on the barrel. But more frequently, while the apples would be of about the same quality throughout the barrel, the whole was quite inferior to what was to be expected from the marking on the barrel. It was for the purpose of eradicating these two evils and of standardizing the apples of New York that the Legislature passed this new law. Under it the buyer will feel safe in purchasing barrels of apples without opening them, because he will know that if they are not of the quality and kind indicated by the marks on the barrels, which marks are well defined under this statute, the packers of the apples can be prosecuted. The packers of apples who head up their barrels and consign them for shipment to distant markets will realize that no carelessness or ignorance will be tolerated by the State and that they must pack their goods so that the public cannot be deceived by the stencil marks on the barrels. Improper markings on the part of the packer will involve not merely the paying of a fine but may also brand him as a criminal. It is of the utmost importance, therefore, for the packer to know at what point the first step is taken which calls into operation this new statute.

ORCHARD PACKING.—In Western New York the apple growers have been under the impression, fostered by subordinates of the State Department of Agriculture, that all apples packed in the orchard must be packed according to the provisions of this new statute. A careful study of the statute, however, leads to the conclusion that it does not apply necessarily to operations in the orchard. Experience shows that barreled apples, to be shipped or stored properly, must be well packed, which includes facing, sorting, shaking down and properly heading. This packing makes the barrel a closed package within the meaning of the statute. Does the statute mean that all barrels so packed must be marked in accordance with the terms of this statute? Many orchardists place such barrels in their own cellars partially for family consumption and partially for sale later on. Thousands of barrels that are placed in storage are never sold as originally intended. They may spoil, they may be used for cider or they may be evaporated. It may safely be said that all barrels of apples placed in cold storage and kept there over two months must be reopened and many of them repacked. This is due to the fact that even the best apples in the best cold storage will deteriorate and that one apple becoming bad infects all the rest. It is due to the fact also that occasionally in even the best cold storage plants the temperature gets either too high or too low, injuring the apples. Such mishaps are seldom discovered until the barrels are opened and the condition of the contents disclose the cause of the trouble. None of these barrels, therefore, can be said strictly to have been packed for sale; they were really packed for storage with mental reservation on the part of the owner to determine later what disposition should be made of them.

SCOPE OF THE LAW.—The Legislature never contemplated such barrels as constituting the evils complained of, and for which the State sought a remedy, consequently, the Legislature never intended that the statute should apply to such barrels. There are various steps in the process of sale; they include, according to the statute, the packing, the transporting or other distribution and the offering or exposing "for sale"; each and all of these expressions defining each step of the process, must be understood as qualified by the words "for sale." If the barrels are packed for storage, for gift, or for home consumption they do not come within the statute.

STORAGE APPLES.—In great commercial operations in which apples are taken from the orchard to storage houses, to be held until a rising price later on brings them into the market, the statute does not apply before the apples reach the storage, unless they are packed in the orchard by the grower and then sold to a jobber. If, as has heretofore been the custom, large buyers purchase in the orchard and have the fruit packed under their own supervision, they may pack and mark them, if for storage, according to their own desires. But when later on the barrels are opened preparatory to repacking for immediate transportation to market, then the statute intervenes and the packing and marking must be done strictly according to its terms.

THE STATE'S JURISDICTION.—The State is concerned solely with the public sale of such products, and only where the first step is taken toward such public sale does its jurisdiction apply. It would be intolerable in such a country as this for the government to interfere in the management of an individual's private affairs to the extent of directing how they must box or pack provisions for their own use. The line must be drawn strictly, and it is only where the State can show clearly that the individual is engaged in public operations, that it has the slightest pretext for interfering. The storage of fruit by an individual is not such a public operation; no one is interested in it except himself and no one can be imposed upon or exposed to loss until a sale is attempted. It is only when the closed package is intended finally for sale, with no expectation of reopening it, that the statute applies. CHARLES J. HERRICK.

The Law About Glandered Horses.

OUR neighborhood is quite stirred up over a report that there has been a law passed by the State of New York or State of New Jersey or both, requiring all horses to be examined by somebody, and a health certificate given, otherwise owner or driver are liable to arrest. Can you inform us about it?

New York. W. E. H.

The law referred to relates to glanders, and Commissioner Calvin J. Huson, Commissioner of Agriculture of the State of New York has issued the following order:

"State of New York, Department of Agricultnre.

Notice and Warning Against Glanders or Farcy.

Albany, N. Y., May 28, 1914.

To Whom it May Concern:

"Pursuant to the provisions of Section 91 of the Agricultural Law, I, Calvin J. Huson, as Commissioner of Agriculture of the State of New York, hereby give notice that the contagious or infectious disease known as Glanders or Farcy exists or recently existed in that portion of the State of New York known and designated as the City of New York. Therefore in accordance with the authority conferred and duly imposed upon me as such commissioner by the provisions of Article 5 of the Agricultural Law as amended, I hereby order and direct as follows:

"1. That no person or persons shall remove or assist in removing from within the said City of New York any equine animal to any point or points outside of the said city during the pendency of this notice and order, unless such person or persons shall have first received a permit duly issued by the Commissioner of Agriculture of the State of New York authorizing the removal of such equine animal or animals from said city.

"2. Nothing in this order shall be construed to forbid the transportation by common carriers of equine animals from points without the State to their points of destination within the State, or to such equine animals transported from points without the State to points to other States; nor shall it apply to healthy equine animals in the performance of their daily work.

"This notice and order and regulations issued thereunder will continue in full force and effect until formally withdrawn. (Signed) CALVIN J. HUSON, Commissioner.

No such law to my knowledge exists in New Jersey. I raised the question with Commissioner Huson as to whether this ruling applied to work horses plying between New York and New Jersey, since it would seem that Section 2 clearly admits common carriers. Dr. H. D. Gill, Veterinarian in charge writing under date of September 28th writes me as follows:

"Your interpretation of our quarantine notice that horses in the course of their daily work are exempted from the mallein eye test is wrong. Quoting from the quarantine notice, 'nor shall it apply to healthy equine animals in the performance of their daily work,' I desire to call your attention to the word 'healthy,' signifying that the animal must be free from disease. Glanders being the disease affected by this quarantine, and the several mallein tests being recognized as positive diagnostics, we must be satisfied that all equine animals are mallein tested for glanders before permission is given to take them in and out of our State."

It would seem to me that the word "healthy" is a joker. Animals might be unhealthy, and still not affected with glanders, therefore, why not test them for every other disease? I have written to the Commissioner, asking if the law is to be enforced as thus interpreted, and if it will be necessary to have all work animals subjected to the mallein test. A definite reply has not been received at this date. F. C. MINKLER.

N. J. Experiment Station.

New York State News.

STATE HOP EXPERIMENTS.—The State Experiment Station at Geneva, will conduct experiments in hop growing on a farm at Milford, N. Y. Six acres of land have been leased for a term of 10 years on the farm of P. R. Bennett. The work will be in charge of J. F. Barker and four assistants. The land is to be divided into sections of one tenth of an acre each and the wire trellis system will be used.

TO ORGANIZE CATTLE CLUBS.—Otsego County is feeling the effects of having a live farm bureau manager. The farmers are awake to the needs of organizations of different kinds and it is proposed to form a county Holstein club, at Richfield Springs November 6 and a county Guernsey club at Oneonta November 12. Two cow-testing associations have been organized each having 26 dairymen as members and 1,400 cows are represented. Claude Whipple is president of the Cooperstown association and Floyd Hooker, of Cherry Valley, of the Springfield and Cherry Valley association.

STATE CONFERENCE ON COUNTY AFFAIRS.—November 13 and 14 the New York State Conference for better county government will be held in Schenectady. It will be a kind of clearing house for ideas concerning more efficient and economic county government. Among the speakers announced are Gov. Glynn, Otto G. Cartwright, secretary of the Westchester County research bureau; V. Everit Macy of the same county; Henry J. Cookingham, county attorney of Oneida County; Geo. S. Buck, auditor of Erie County; Herbert Harley of the American Judicature Society; Ernest Cawcroft of Albany, Assistant State Treasurer; L. K. Rockefeller of the State Comptroller's office.

NEW COW TEST ASSOCIATION.—Farmers in the vicinity of Attica have organized a cow testing association with E. H. Waite as president, and Henry Gior, secretary and treasurer. Similar associations have been formed at Perry, Warsaw and Java.

GOOD POTATO CROP.—E. C. Gleason is a farmer living near Malone, N. Y., who grew, this year, 43 acres of potatoes in one block. On this tract there were 12,363 crates of tubers or a total of about 11,000 bushels, and they were all dug and delivered to the station in 12 days. They were of excellent quality.

PROGRESSIVE GRANGE WORK.—The Grange in Suffolk County is accomplishing things. We do not know of a more progressive, constructive work being done anywhere in the State by the Grange than this of the Pomona and several subordinate Granges in the county named. Among some of its chief works is the selection and breeding of seed corn. Three judges were required to visit the members' cornfields this Fall to get yields, make measurements, examine the corn and gather all the information needed to report to the meeting of the Grange when prizes were awarded. At the same meeting 40 candidates took their first degrees. The corn exhibits after being judged are displayed in the store windows of the town. This Grange and most others of the county, coöperate with the new Long Island School of Agriculture, and take advantage of the extension work afforded by the school. There are 14 Granges in the county and 10 had exhibits at the county fair this Fall. Each contributed to the Pomona exhibit, which covered a space of 400 square feet which was not large enough. The first prize went to Mattituck Grange. The Granges have been doing a considerable business in a coöperative way, especially in seed potatoes, fertilizers, lime and other farm supplies. The bureau of information and markets is a distinct evidence of the worth of the work being done by the Suffolk Pomona. The main object of this bureau is to enable farmers to find better markets, largely with the ultimate consumer. J. W. D.

Lyle's Grain Figures.

OSCAR LYLE, the grain expert, makes the following statements of conditions and outlook of the leading cereals at this time:

Farmers' holdings November 1, 1913....	137,972,000
Crop, 1913	2,446,988,000
Supply	2,584,960,000
Remaining March 1, 1914	866,392,000
Disappearance, four months, November 1, 1913, to March 1, 1914.....	1,718,568,000
Crop, 1914, estimated	2,676,000,000

It is in general belief the acres seeded to winter wheat will be largely increased over last year, when 36,506,000 were planted. Of this, 1,119,000 acres were abandoned and the harvest was from 35,387,000 acres. Average yield was 19.1 bushels per acre and crop estimated 675,500,000 bushels.

Average abandonment, taking many years, is over 10 per cent. Should we increase acreage seeded to 40,000,000 and abandon but five per cent, we would have 38,000,000 for harvest in 1915. An average yield of 15.6 on this acreage would be 593,000,000 bushels. It is not likely the winter wheat crop, equal the phenomenal crop of 1914, will be raised in 1915.

RUSSIAN CROPS.

	1914.	1913.
Wheat	779,000,000	956,000,000
Oats	1,560,000,000	1,950,000,000
Rye	870,000,000	970,000,000

Russia's annual requirements of wheat about 560,000,000.

The wheat crop of Manitoba, Saskatchewan and Alberta in 1914, estimated 148,000,000 bushels, compares with 209,000,000 last year and 204,000,000 two years ago. Oats crop, estimated 174,000,000, compares with 242,000,000 last year and year before.

Woman and the Home

From Day to Day

ALL-SAINTS.

One feast, of holy days the crest,
I, though no Churchman, love to keep,
All-Saints,—the unknown good that rest
In God's still memory folded deep:
The bravely dumb that did their deed,
And scorned to blot it with a name,
Men of the plain heroic breed,
That loved Heaven's silence more than fame.

Such lived not in the past alone,
But thread today the unheeding street,
And stairs to Sin and Famine known
Sing with the welcome of their feet;
The den they enter grows a shrine,
The grimy sash an oriel burns,
Their cup of water warms like wine,
Their speech is filled from heavenly urns.

About their brows to me appears
An aureole traced in tenderest light,
The rainbow-gleam of smiles through tears
In dying eyes, by them made bright,
Of souls that shivered on the edge
Of that chill ford repassed no more,
And in their mercy felt the pledge
And sweetness of the farther shore.

—James Russell Lowell.

*

THE following is Martha Washington's historic recipe for fish chowder: Cut five or six slices of salt pork thin and try them out in the bottom of the chowder pot, then put in a layer of thinly sliced codfish, a layer of sliced onions, one of potatoes sliced thickly, three pilot crackers and repeat until there are three layers of each ingredient, and then add pepper, salt and a lump of butter. Lay around the edge a few more of the pilot crackers, put in water almost sufficient to cover the mixture and let stew for a half hour closely covered, then add a cupful of sweet cream and serve.

*

A CORRESPONDENT who gives experience in educating young children at home says:

Does it not suggest a field of work for our farm girls, high school gradnates, who want to stay at home if they can make money there?

The visiting governess is familiar abroad, and in many cities here. Where she is employed in more than one family, visiting them at stated hours, and for a certain period of time, her charges are usually made by the hour. Surely it would be entirely practical for a girl with proper training to take up such work in a locality where the little ones are debarred from school by considerations of health, weather or distance.

*

THOSE who love animals, and who are saddened by the thonght of the many American horses now going abroad to take their part in the carnage of European battlefields will be glad to know that the Purple Cross Society has been formed in England. Its object is to care for wounded horses, and to destroy those in hopeless suffering. Another humane work nndertaken in Great Britain is the care of soldiers' dogs, so that pet animals may not be left homeless and unprotected. Any soldier on active service may send his pet dog to the National Dog Defense League, which will care for these animals during war, and provide future homes for them when their masters do not return.

*

WE are asked every season for some method of keeping cider sweet. Various methods have been given us; some say that if the barrel is sterilized with sulphur before nsing and a handful of mustard seed put in the cider, it will keep well. Of this we have no knowledge, and the method we should select would be to sterilize the cider like unfermented grape juice, and then seal in bottles or earthenware demijohns. The Yearbook of the Department of Agriculture for 1906 gives instruction for the preparation of unfermented apple juice. The first step in the process is the clarifying of the jnice. Instead of straining, running through the separator is recommended; this removes all sediment. The best results are obtained from a hand separator with a capacity for milk of 450 pounds per hour. After running from 25 to 40 gallons of cider, it is necessary to clean sediment from the bowl. The cider is then put in bottles, leaving some air space for expansion, corked (the cork well driven and tied down) and then entirely submerged in water in a tank heated by steam. In household use they would be put in a kettle on the stove. After heating water to 158 deg., 25 to 30 minutes are required to bring contents of the bottles to this temperature, and as they are held at 158 deg. for half an hour, about one hour is needed for the work. In some cases the government investigator only used a temperature of 149 deg., and found results satisfactory. On removing the bottles from their bath, the cork was coated with paraffin before storing away. It must be observed that the cider is not *boiled*, nor is the water in which the bottles stand; tightly-corked bottles would be dangerons if contents were allowed to boil, and the aim is to sterilize without cooking. Bottles were the handiest receptacles, it being difficult to sterilize in larger vessels. Barrels or kegs are not tight enough to keep the sterilized juice.

The Rural Patterns.

In ordering, always give number and size of each pattern desired. Price of each pattern 10 cents.

Circular skirt 8441A is one of the newest models. For the medium size, the

8457A One-Piece Gown, 34 to 40 bust,

skirt will require four yards of material 27, 3⅝ yards 36, 2½ yards 44 inches wide. The width at the lower edge is three yards and four inches. The pattern of the skirt 8441A is cut in sizes from 24 to 34 inches waist measure.

The costume shown in No. 8457A is a stylish moyen-age model, which may be made as a tunic or full length for a complete gown. The bound edges make a feature of the season, also the high collar that is open at the front. For the medium size, the redingote shown in the large view will require 5¼ yards of material 27, 4½ yards 36 or 44, 3½ yards 54 inches wide, with 1½ yards 27, ¾ yard 36, 44 or 54 inches wide for the sleeves and collar; the entire gown seven yards 27, 5½ yards 36 or 44, 4½ yards 54 inches wide, with two yards 10 inches wide for the sash. Pattern 8457A is cut in sizes from 34 to 40 inches bust measure.

Apple Syrup—A New Product.

THE Department of Agriculture announces that its chemists have perfected a formula for making a desirable table syrup from apples. They have applied for a public service patent covering the process, which will prevent any monopoly, and enable any cider mill to use it. The new syrup, one gallon of which is made from seven gallons of ordinary cider, is a clear ruby or amber colored syrup of about the consistency of cane syrup and maple syrup. Properly sterilized and put in sealed tins or bottles, it will keep indefinitely, and when opened will keep under household conditions as well as other syrups. It has a distinct fruity aroma and special flavor of its own which is described as being practically the same as the taste of the syrupy substance which exudes from a baked apple. It can be used like maple or other syrups for griddle cakes, cereals, household cookery, and as flavoring in desserts. The Government cooking experts are at present experimenting with it in cookery, and expect shortly to issue recipes for use of the new syrup in old ways, and for taking advantage of its special flavor in novel dishes.

The success of the experiments has greatly interested some of the apple growers, and during the Fall a large cider mill in the Hood River Valley, Oregon, will in co-operation with the Government chemists, endeavor to produce 1,000 gallons on a commercial scale, and give the new product a thorough market test by making it accessible through retailers in a limited field. The interest of apple growers in the product arises from the fact that the new apple cider syrup promises to give them a commercial outlet for vast quantities of windfall and other apples for which they hitherto could find no market, either in perishable raw cider or in vinegar.

The process for making the syrup calls for the addition to a cider mill of a filter press and open kettles or some other concentrating apparatus. The process is described as follows: The raw cider is treated with pure milk of lime until nearly, but not quite, all of the natural malic acids are neutralized. The cider is then heated to boiling and filtered through a filter press, an essential feature of the process. The resultant liquid is then evaporated either in continuous evaporators or open kettles, just as ordinary cane or sorghum syrup is treated. It then is cooled and allowed to stand for a short time, which causes the lime and acids to form small crystals of calcium malate. The syrup is then re-filtered through the filter press, which removes the crystals of calcium malate and leaves a syrup with practically the same basic composition as ordinary cane syrup. Its flavor, however, and appearance are distinctive. Calcium malate, the by-product, is a substance used in medicine and at present selling for $2 per pound. It is believed that if calcium malate can be produced in this way cheaply and in large quantities, it can be made commercially useful in new ways, possibly in the manufacture of baking powder.

A MAN'S first care should be to avoid the reproaches of his own heart; his next, to escape the censures of the world; if the last interfere with the former, it ought to be entirely neglected; but otherwise, there can not be a greater satisfaction to an honest mind, than to see those approbations which it gives itself seconded by the applauses of the public; a man is more sure of his conduct when the verdict which he passes upon his own behavior is thus warranted and confirmed by the opinion of all that know him.—Addison.

619-621 Champlain Ave., Cleveland, Ohio

Seen in New York Shops.

FRENCH dressing sets are shown among decorated china, for the convenience of those who like to prepare the salad at the table. The set includes a tray of fancy china, which carries receptacles for oil, vinegar, mustard, salt and pepper; some have a small lemon reamer, powdered sugar shaker and sauceboat.

Some of the newest handbags are a pouch shape, not very deep, but rather wide, with a down-curving top frame. These are made in moire, panne velvet and pleated morocco, in colors and black.

Among women's coats that look like fur are silk plush and broadtail cloth; they are cut on the plain lines of a fur garment, and are very warm and handsome. They cost from $18 to $25. Zibeline coats at the same price are very soft and furry. Mannish overcoats for women are of English tweed; they are cut as much like a man's overcoat as may be worn by a woman and are warm and weatherproof. Some handsome ones of high-grade materials and workmanship, in various subdued mixtures, were $18.75.

New blankets are seen with floral borders, pink, blue, yellow or lavender, and a binding of corresponding color, there are also many blankets with a colored all-over design of blocks, check or striped. In addition to the delicate colors, there are some extremely pretty ones in designs of soft wood brown on cream. Holland blankets of Australian wool costing $10 to $12 have a very long woolly nap, and are striped all over, yellow and white or blue and white. Blanket covers of thin silk, two yards long, are meant to use over the blankets at night, when the bed cover is removed; they are trimmed with Cluny insertion.

The "Le Brun" muff is a large round style of the "melon" shape, accompanied by a boa. It is modeled after the furs shown in portraits painted by Mme. Vigee Le Brun, the French artist who has preserved for us fashions and personalities of French society from before the Revolution to the end of the First Empire.

We have seen black velvet hats everywhere since July, and now we are seeing felt hats by way of change. They are fine smooth French felts, in all colors, and all prevailing shapes, especially the large flat sailors. Prices vary, but many of them are $3.50 and up, without trimming. Another style of ready-to-wear hat, that has attained a great popularity very quickly, is of velour, in black, dark brown or navy blue. The shape is almost identical with a man's hat, rather high crown, rounded, and flat brim with a slight roll at the edge; there is no trimming except a gros grain ribbon band. These hats are very practical, and becoming to a young face; they cost from $2.50 to $3.

Sleeveless basques, blouses and Russian jumpers of velveteen and panne velvet are very smart, and also practical. A good many styles are shown. The simplest model is a sleeveless waistcoat with large armholes, cut rather high, with a V-neck. Sometimes it is drawn in at the back with a buckled band, sometimes there is a sash, starting near the front, and knotted low at the back, like a basque. Some are straight jumpers, coming below the waist, and fastened under one arm, with large armholes and low V-neck; others a plain waist, slightly gathered at the waistline, where a smooth-fitting peplum is attached.

Breitschwanz, which is used to trim many new suits, is a fur cloth made in imitation of broadtail fur; it is very silky and handsome.

Women who wish to buy a plain black house dress ready-made will find desirable models sold as maids' or waitresses' uniforms. In black sateen such dresses may be bought for $1.75; black soisette, with white collar and cuff, $2.50; black or gray mohair, $5. Nurse's uniforms in white linene are $3; in white poplin $4.

GAMES are not meant for idle people who have nothing to do but study them; their true use is as a relaxation for the man who is doing some serious work in the world, and is doing it hard enough to make games the occupation of a holiday and not of his best strength and time.—Filson Young.

Canned Chard; Quince and Sweet Apple; Ground Cherry.

WILL you publish reliable recipe for preserving Swiss chard for Winter use? I find in THE R. N.-Y. recipes for cooking chard; but do not remember seeing direction for preserving it. 2. I would also like recipe for cooking quinces with sweet apples and other fruit. 3. Would ground cherries or husk tomatoes be improved by adding some lemon or cranberries when cooking? If so, what proportion? S. W. C.

1. The following directions for canning Swiss chard were given in THE R. N.-Y. for April 20, 1912, by a housekeeper who found the results very satisfactory. Wash the chard, boil just enough to wilt it, then pack in jars solid, put on rubbers and covers, but do not fasten tight. Place the jars in a kettle of water and boil one hour; take out and fasten covers securely. The next day loosen the cover, boil one hour, close as before, and the following day repeat the process, closing tight at the last. The same process is used for canning spinach.

2. In cooking apples and quinces together it must be remembered that the quinces take more time to cook, and in preserves, or in making a fruit compote, it is wise to boil the quince until tender, without sugar; the water in which this fruit has been boiled is then used for the syrup. But all the recipes we have call for tart apples with quinces; we find nothing about sweet apples, though we believe they would combine very pleasantly.

Quince Butter.—Use half a gallon of quinces pared and cored, half a gallon of tart apples pared and cored, two quarts of sweet cider, one pint of cold water. Cover the crock and stew gently until the fruit is very soft; then pass through a sieve. Add five cupfuls of sugar and cook until soft.

Quince and Pear Sauce.—Three pounds light brown sugar, six pounds pears, quartered if large, small ones cut in halves; nine pounds quinces, quartered. Boil sugar, pears and quinces nearly all day, taking care not to let them cook too rapidly, until both pears and quinces are of a rich red, and the juice an amber syrup. Can and seal tight. The fruit keeps its shape, the pears having gained a fine flavor from the quinces, and the quinces having added goodness from the pears.

We cook quinces in a compote (stewed in syrup in quarters) combined with tart apples, but have not used sweet apples. The quinces must receive extra cooking first, or the apples will be "done to rags" before the quince is tender. We also like a few slices of quince in apple pie. We should like to hear from anyone who has sweet apple and quince recipes.

3. We have never cooked ground cherries or husk tomatoes, though quite familiar with the wild fruit. We have always considered it very flat and insipid; in fact, more like potato balls than anything else, and lemon would certainly improve it. Perhaps some experienced reader can advise us. In green tomato preserves, the juice of four lemons is used to eight pounds of fruit, which would doubtless be satisfactory with the ground cherries. Only experience can advise as to the proportion of cranberries to be used with them, though this acid would doubtless improve them.

Souse.

I WOULD like to have a good recipe for making souse. J. C. W.

The following recipe for souse is given in the "Rural Cook Book": Clean pig's ears and feet well; cover them with cold water slightly salted and boil until tender. Pack in stone jars while hot, and cover while you make ready for pickle. To half a gallon of good cider vinegar allow half a cup of white sugar, three dozen whole black pepper corns, a dozen blades of mace and a dozen cloves. Boil this one minute, taking care that it really boils, and pour while hot over the still warm feet and ears. It will be ready to use in two days and will keep in a cool place for two months. If you wish it for breakfast, make a batter of one egg, one cup of milk, salt to taste, and a teaspoonful of butter, with enough flour for a thin muffin batter; dip each piece in this and fry in hot lard or dripping. Or dip each in beaten egg, then in pounded cracker before frying. Souse is also good eaten cold, especially the feet.

A Window Cooler.

HAVE you a pantry or kitchen window on the shady side of your house? If so have the "men folks" fix you a window box just to fit the lower sash. The four sides are 10-inch boards and the outer covering is of fine-mesh wire. With one extra shelf this makes such a handy place to set the pie to cool for dinner. In moderately cool weather, butter, lard, milk, etc. can be kept there and save much running up and down cellar.

Put a sash curtain on the inside and this is not unsightly. A. D.

With a Victrola every home can enjoy the world's best music

The Victrola is the "open sesame" which admits you to the enjoyment of all the music of all the world.

It reveals to you in their grandeur the musical gems of the ages. It brings to you the art and personality of the most famous singers and instrumentalists. It presents an endless variety of melody and mirth to suit your every mood.

That is the charm of the Victrola, and right in your own home you can have ready access to this inexhaustible supply of musical riches and enjoy them at your pleasure.

Any Victor dealer in any city in the world will gladly play any music you wish to hear and demonstrate the various styles of the Victor and Victrola—$10 to $200.

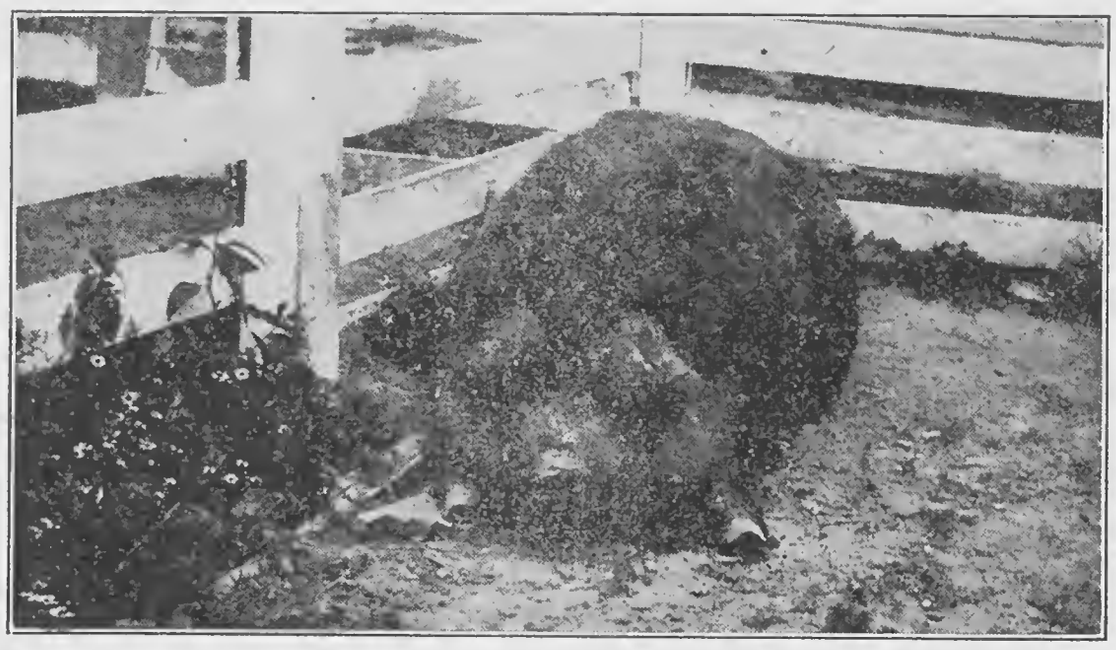
FARM STOCK BREEDING.

Swine Breeding.

PART V.

LARD AND BACON TYPES.—A few years ago the great demand was for what has been termed the "lard" type of hog. This demand of the local butchers and packing houses was in response to a similar demand from across the waters. Foreign countries demanded pickled or salted meat and the lard type of hog in the one most valued for this purpose because of the large amounts of fat which most salt pork eaters want along with the lean. The lard type of hog embraces the Poland China, Chester White and Duroc Jersey breeds. Often, the Berkshire is also enumerated in this class. These hogs are broad backed with a cylindrical form and the ability to put on internal fat when corn-fed. In fact, the lard hog is the one which is almost wholly raised in the corn belt. It is claimed that a few generations of feeding even this type of hog on the cereals such as barley, rye and wheat will in time cause them to lose their rotundity of body and become more the type of the bacon hog.

Instead of exporting pork in pickle now, approximately three-fourths of our export trade is in bacon and so the raising of this class of hogs has largely displaced that of the lard hogs except in the exclusive corn States. Where hogs are fed on some other fattening stuffs besides corn, there is a tendency to produce more muscle. This is due to the higher percentage of protein contained in



A NINE-HUNDRED POUND MULE-FOOT HOG. FIG. 586.

the cereals than in the corn; proteid feeds make muscle. Corn is especially rich in starches and as this class of feeds ultimately is converted into animal fat, we can expect the lard hog to be more profitable and easily raised where corn is the exclusive fattening diet.

The bacon breeds are the Large Yorkshire and Tamworth while in some localities, the Berkshire hog is enumerated in this class, also. Because of their greater proportions of muscle, these animals are more active and as the bacon is that portion in which their main value lies, they have been bred many generations for length and depth of side meat. They are more angular, with less breadth of back, usually longer on legs and with a body conformation which is rectangular rather than cylindrical. The breeders are striving toward longer and deeper sides with fat and lean meats well mixed. This gives a better grade of bacon and after all, the demands of the market are what breeders in all classes of stock must meet, if they are to make their business profitable.

MARKET REQUIREMENTS.—As to the market requirements for hogs, it demands bacon—then more bacon and when that is exhausted, the buyers buy fat pork for pickling. Our export trade to people engaged in land occupations is mostly in bacon while meat in pickle is used largely for feeding armies, fishing expeditions, exploring parties and others engaged in pursuits which require a cheaper, yet well preserved meat.

The weight of hogs which the market demands was at one time for hogs weighing from 400 to 500 pounds, but during the last three or four years, an excessively large hog has been somewhat discounted, and the urgent need is for a hog weighing when marketed from 250 to 300 pounds. These are bringing the top notch prices and it seems better for the farmer to market his hogs at this weight than to keep them longer. The younger any fattening animal is, the more economical are the gains which can be put on by feeding. Experiment stations and practical farmers have proven that it costs less to keep two thrifty pigs growing until they weigh from 250 to 300 pounds than to make a single animal weigh from 500 to 600 pounds.

There is a distinct type of animal which is most in demand. This is a short, close-coupled hog with a small bone. Since bone can hardly be considered an article of diet, the market wants no more of it than it actually has to have. An excessively large bone can be transmitted by a boar just as well as length and depth of side; on the other hand, a bone sufficient to sustain the weight which will be placed upon it is what is desired. One point upon which the market is especially "cranky" is a short snout. A carlot of long snouted market hogs will not command a premium by any means. This statement must not be construed to mean that the seemingly long snouts of the bacon hog are charged up against them but for a hog of the lard type to have this snout would be considered a defect. The market wants uniformity of color, size and conformation. While this has no weight when selling only a hog or two to the local trade, it is quite an item in a carload of fat or bacon hogs. There is no question but that such a lot of swine is hard to keep uniform but the efforts of the breeder in this direction are sure to be rewarded in the form of more cash.

THE PUREBRED BOAR.—The purebred boar has just as good a chance to stamp his characteristics upon his offspring as has any other high-class sire but simply because a boar is purebred and has a record a mile long is no sign that he will improve the herd. We should be just as careful in choosing him as we would a beef bull and not be guilty of raising for sale as sires all purebred male hogs. Select a boar that stands up to the market requirements. If the market to which one's sales are made wants bacon hogs, choose a sire of the breeds mentioned and note that he has long, deep sides, sufficient yet not coarse quality of bone and a mild temperament. A point about which there is some contention is the emphasis which may properly be placed upon the bristles covering the animal. Some authorities assert that these are an index to the qualities of flesh and bone which lie under them while other equally as good authorities emphatically deny this statement. There can be no set rule in this regard but it would seem that excessively coarse bristles are to be discouraged while on the other hand, exceeding fineness usually goes with the delicate animal. Delicacy is esteemed in some farm animals but the delicate hog is scarcely a utility animal because a hog is valued largely because of the amounts of food which he can consume and from which he is able to make such economical gains.

SELECTION OF BROOD SOWS.—Do not make the mistake of selecting sows for breeding purposes that measure up to the market standards. The short, closely knit sow is scarcely ever a prolific breeder. On account of the small room which is given for the reproductive organs, the litters from such sows are usually small. It is a common occurrence for such sows to lack nipples enough to feed a large litter. Also, the short-bodied animal seldom has the stomach capacity which enables her to consume a sufficient quantity of food, from which to make the milk which is needed for rapid development in the pigs. The uniformity of one's product carries so much weight in fixing the market price, that grade sows at least ought to be the mothers of the future market stock. One must not, however, think that the present stock must be sold and grade stock bought. Use the stock on hand with purebred boars. The first generation will be grades, the next generation will be three-fourths pure-blood and so on. Let the brood sows be long in body with fairly good depth. This will allow for good stomach capacity and also gives ample room for the reproductive organs which must be strong if the sow is to be prolific and bear vigorous litters. The first time a sow farrows, she is likely to have a small litter of inferior pigs. Give her another chance and then if she does not bring forth a good sized litter of healthy pigs, send her to the butcher. Once having discovered a sow that invariably farrows eight or 10 pigs and has the ability to feed them all and keep them growing, do not under any circumstances allow the butcher to knife her. She is an animal that cannot be duplicated every day in the week.

The size of litter each sow should have is a much disputed point. The prolificacy of some breeds have been very seriously impaired by heavy feeding and selection of short bodied brood sows. The simple fact that constant breeding from such sows has impaired their prolificacy shows that the size of litter is inheritable. A sow pig from a mother that pro-

FOR SALE

SUFFOLK STALLION

Fine Suffolk stallion, bred in the west, and whose pedigree is unknown to the owner. Five years old in spring. Dapple grey; 17 hands high; weight, 1450; a fine driver and will work in all harnesses; sound and gentle to handle, the kind to breed to. Will sell on easy terms, or will trade on a pair of two-year-old colts. F. L. PLANKENHORN, Prattsville, N.Y.

50 STALLIONS

and MARES, $250 to $1000 each

Write for my Illustrated Circular telling why I can save you money on the purchase of a Percheron or Belgian Stallion or Mare.

The RURAL NEW-YORKER

333 West 30th Street, New York City

Are You Proud of Your Dairy Profits?

When you compare your monthly milk check with your monthly feed bill do you swell up with pride at the results of your *business-like dairying*, or do you feel like selling out and moving to town? Don't blame the cows, the soil or the high cost of feed. *Study your business.* Others who do are showing fine profits. You can, too.

Mr. V. E. Fuller, confidential feeding expert of some of the greatest dairy herds in the country, has written a book. It tells of the rations and feeding methods which have made Mr. Fuller one of the leading authorities in the world on feeding the dairy cow. When cows run down in milk, Mr. Fuller is called upon. He mixes rations that bring them up. The results of his many years' experience are in this book. You should have it by all means. We now offer you this most practical of all treatises on profitable dairy feeding—

"FEEDING COWS FOR PROFIT"

and the

FARM JOURNAL

130 West Washington Square

Philadelphia

For Four Years for an almost unbelievable price

Both for $1

Send your $1 direct to Farm Journal. Order early, for these books go fast.

A Single Issue Is Worth the Price Asked

Then too, the book originally sold for $5.00 per copy. Now you get both for $1.00. The only difference in the books of the first edition and the one now offered is in the binding. All the original matter is there and more, too, for Mr. Fuller has added some feeding formulas just for "Our Folks."

The Farm Journal Is "Unlike Any Other Farm Paper"

so our subscribers say. And it is. Farm Journal gives not only the latest data on dairying and other farm subjects, but it treats of *the broad truths of farm life.* It cheers and encourages as well as educates. If at any time dissatisfied, your subscription will be cancelled and the money for the unexpired portion refunded.

"Feeding Cows for Profit" shows Mr. Fuller's methods in feeding the following noted herds:

Elm Leigh Farm, Putney, Vt.; Rich Neck Farm, Claiborn, Md.; Briarbank Farm, Birmingham, Mich.; Middlesex Meadow Farm, South Lincoln, Mass. These are only a few of the many famous herds whose great records, made at a minimum cost, are the result of Mr. Fuller's feeding rations. Send in *your* order for the book *today*. Begin building up your dairy profits *at once*

YOUR Milking Machine

Every demand you can make of a milking machine is included in the "Universal Milker"—tho

Hinman Milker

It enables a boy to milk 25 cows an hour. 250,000 cows milked daily. It is noiseless, light, easily cleaned, easily adjusted. Exclusive features—no vacuum in pail; no piping—just a simple drive rod; only two moving parts; quick pail changing idea; separate machines. "A success for six years." Write for name of nearest Hinman owner and our last booklet "Making More Money With the Hinman Milker."
HINMAN MILKING MACHINE COMPANY
83-93 Elizabeth St., Oneida, N. Y.

duces large litters has proven to be more likely to throw large litters than small ones. Some breeds seldom farrow more than six pigs to a litter and more often less than this number. Other sows go on year after year farrowing 14 to 16 pigs while only 10 or 12 of these can be raised. I would rather have a sow that will farrow from eight to 10 healthy pigs at a time and raise them. However, economical production demands that the standard should seldom go lower than seven or eight pigs at a farrow. Mate the boar possessing those peculiarities of form prized by the market to such long bodied sows and the resulting pigs will grow quickly. Even though they do not top the market, one can hardly afford to sacrifice fecundity for the shorter body.

PARASITES AND DISEASES.—Hogs have lice; they also have mange or scab which is a parasitic ailment. Should brood sows or stock boars be suffering from these parasites, the coal tar products in some form will afford relief if used persistently. The scourge of the hog breeding industry is hog cholera. A few days ago, I read a description of this germ and, in fact, a few years ago, the Department of Agriculture thought they had isolated the hog cholera organism but later found out that they had been misled by an organism which produced a similar though not exactly the same disease. At present, we are at sea on this whole proposition. The true germ, if there be one, has as yet not been seen. In all events, the disease is highly transmissible and all possible precautions should be taken against its entrance into a herd of breeding hogs. As has been noted before, a brood sow having true hog cholera will usually abort. The cholera may take the sow off quickly or she may linger along for a year or so and finally recover. In this case, it has been noticed that she will never have the disease again and it is claimed that the pigs from such an immune sow are somewhat immune also. The immunity, however, is not claimed to last into the second generation; it stops with the first. As to whether there is any real immunity, we cannot be absolutely sure. I have heard farmers and stockmen scoff at the idea that hog cholera is a transmissible disease, yet a yard full of dead and ailing animals is hardly a spectacle calculated to excite a scoff. Keeping the pigs healthy and clean will increase their resistance to the disease, but an ounce of prevention of infection is worth a thousand pounds of cure, in the case of hog cholera. Our very ignorance of its transmission should be enough to cause us to avoid it. The problem of the hog breeder is to supply the market with what it wants and at the same time, keep up the vigor and prolificacy of the herd. Avoid any breeding practices that will decrease animal vigor and hence increase liability to losses.

I. J. MATHEWS.
Michigan.

What's Wrong With the Pigs?

THE average farmer does not fully appreciate his losses in this line. If his sow farrows a litter of nine pigs, which cost him each, say 40 cents to deliver on farrowing day, then if he loses say three of them the first few days, it brings the cost of his remaining six pigs up to 60 cents at birth; besides, it reduces his raw material which later may be sold at weaning time or as pork. Every hog breeder is concerned with this subject, and they are all attempting to solve the problem.

I believe that many of the hogs on the farm are too closely bred to their own near kin. This will cause the pigs to be inactive; they will not show the proper energy to nurse during the first day or two, consequently lying around too much making them liable to thumps and scours, unless the keeper understands his business thoroughly and feeds the sow with the greatest caution. A good ration for the sow in pig consists of ear corn and one-twentieth tankage together with clover, Alfalfa or Soy bean hay. I like to feed both tankage and legume hay, as the number of weak pigs will be greatly lessened. It must be borne in mind that strong healthy litters cannot be produced unless a proper ration to supply the sow with muscle, bone and energy-making materials is fed, and then plenty of exercise and kind treatment.

On farrowing day the bedding should be plentiful but of such a nature that the pigs cannot get lost in it; the pen should be tight, with no chance for the baby pig to stroll off through some small opening or fall into the feed trough, becoming chilled and unable to find its way to the mother. Many farmers never think of staying up and watching the sow on this occasion, and their success is as great as their neighbor's who stays up with the sow, and even sometimes better, but you will find that the quiet calm attendant who knows his business will be of great help to give the little pigs their first day's chance.

New York. H. F. LEMMERMAN.

F. P. SAUNDERS & SON, Cortland, N. Y.
Office, 50 Clinton Ave.

Purebred Registered
HOLSTEIN CATTLE

Our Advanced Registry Office for the year ending May 1, 1914, shows that 9,116 cows (nearly one-quarter heifers), produced within a seven-day period 3,672,371 pounds milk containing 130,339 pounds butter-fat, averaging 3.55 per cent. The average for each animal (not mentioning the calves that sell at from $100 to $20,000 each) was 27 quarts of milk per day and 16¾ pounds of the best commercial butter in seven days. These figures show why the dairymen prefer Holsteins.

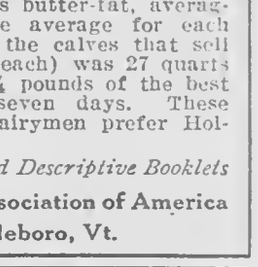
A Pure-bred
Jersey



bull counts for more than the dam in grading up. You should be developing some 400-pounds-of-butter cows. The thoroughbred bull is worth all he costs on grade or full-blood Jersey cows. Like begets like.
THE AMERICAN JERSEY CATTLE CLUB
324 W. 23d St., New York City.

Owl-Interest Blood

MERIDALE A.J.C.C. JERSEYS

flows through the veins of a family of cows whose remarkable persisteney is proven by repeated Register of Merit records. Spermfield Owl's Eva, 16,457 lbs. milk, 1168 lbs. butter; Owl's Sayda's Queen, 13,022 lbs. milk, 940 lbs. butter; and Interested Violet, 13,833 lbs. milk, 819 lbs. butter, forcefully illustrate the ability of the family; while at least a hundred others have demonstrated in yearly authentieated work that these are exceptional only in quantity.

This blood will increase the production of your herd. It is intensified in an excellent bull calf, nearly ready for service, offered by Meridale Farms. He has two crosses to Spermfield Owl, two to Interested Prince, and an outcross to The Imported Jap. For Pedigree address

We are the Largest Makers of Sheet Metal Products in the World

AILING ANIMALS.

Pining Cow.

I HAVE a cow about eight years old that does not eat very much, drinks little. She is due to come in in March and she gives very little milk now; she usually milks right to the last day. I would like advice what to do.

New Jersey. A. T.

It would be impossible for anyone to give a confident opinion in such a case without making a personal examination, but it may be that the cow has tuberculosis. It therefore would be well to have her tested with tuberculin. The disease is incurable and if found present the cow should be destroyed. If she proves to be free from the disease and her teeth and tongue are not affected she may do better if you give her twice daily in a pint of thin oatmeal gruel a tablespoonful of a mixture of one part of fluid extract of nux vomica, two parts of fluid extract of gentian root and five parts of pure alcohol, as a tonic. Tempt her appetite with various feeds.

Wart on Mule.

I HAVE a mule that has a wart on his ear. I have pulled it off several times and burned the place with sulphuric acid but it comes back as bad as ever. How can I remove it? 2. I would like to know of a good mixture of healing powder for sores and galls.

E. M.

1. After removing the wart cauterize the base with lunar caustic pencil and repeat the application if the wart is seen to be growing again. Nitric acid should be used in place of sulphuric acid for burning a wart. 2. A good cheap dressing powder for such sores is made by mixing together equal parts of sulphur, powdered wood charcoal and slaked lime. A more expensive one is made by mixing together one part each of iodoform, tannic acid and calomel and five parts of boric acid. A. S. A.

Dog With Eczema.

AN Airedale pup has been suffering from mange, which is now improved. About three weeks ago I noticed pimples filled with matter on belly which afterward turned to small sores and spread to different parts of the body and head, also the eyes watered and there was a disagreeable odor. In the mornings she seems much worse, lazy and swollen and stiff in the hind quarters. I have given her two pills of gunpowder which has put some spirit into her, but some days she goes back again. What should be done? F. C.

New York.

Make the pup live an outdoor life and stop all rich feeding. Make it take abundant exercise every day. Feed one small meal each night. If you feed milk or porridge and milk mix limewater in each feed. Keep the bowels active, if necessary giving a little epsom salts in water or soup to bring that about. Once a week tub the pup in a 1-100 solution of coal tar dip and then apply sulphur ointment to the sores as often as found necessary. Use benzoated oxide of zinc ointment twice a week on any obstinate sores. A. S. A.

Bloat.

WHAT was the matter with my heifer calf born last March? One morning when I fed the calf milk she was in her usual health. I had her tied with a long rope near my house. At night when I was about to feed her which was twice per day, I noticed she was breathing hard and was bloated; the next morning the calf was dead. Could anything have been done to save this calf? E. A. A.

New York.

Indigestion was the cause of bloat, possibly induced by drinking too much milk quickly. It is best to feed milk three times a day and make the calf suck it from a rubber teat, or at least drink slowly. "Tapping" the paunch with a trocar and canula, for removal of gas, might have saved the life of the calf, or possibly the operation might have been obviated by giving a tablespoonful of turpentine in four ounces of raw linseed oil, or half a pint of new milk. A. S. A.

Injured Eye.

MY four-year-old colt showed one eye partially closed, and on examination I found a slight cut on lid, which was somewhat swollen, also a light-colored spot over about half the eyeball; eyeball is not broken, only watery discharge from it. I washed frequently with salt and water; swelling is better, but would like advice. Apparently injury was done by whiplash.

J. H. B.

In such a case a compress of absorbent cotton or soft cloth saturated with a soothing lotion should be tied over the eye and kept wet with the lotion. A suitable lotion should contain half a dram of sulphate of zinc, 10 drops of carbolic acid, 18 grains of sulphate of morphia and one quart of water. If the eye is opaque or cloudy after the inflammation subsides wet the eyeball once daily for 10 days with a solution of two grains of nitrate of silver in an ounce of distilled water to be kept in a blue glass bottle. A. S. A.

The Prosperous Farmer Is the Wise Feeder

And wise feeding now-a-days means constant crowding. You must keep your stock in condition with keen appetites for every meal. Make Xtra-Vim Feed a part of the daily ration and it will turn the trick for you and will keep the stock free from digestive and intestinal troubles.

Xtra-Vim Feed is a concentrated pure Porto Rican Cane Molasses in dry form. To it is added a small percentage of Sphagnum Moss, which is a fine digestive agent and improves the effect of the total ration.

XTRA-VIM FEED

is a 100% value food. Contains no cheap non-nutrient fillers, is not only highly palatable and nutritious itself, but renders other foods more palatable and more easily digested. It replaces pound for pound of more expensive grains selling at war prices and causes a general improvement in the health of the animal.

Xtra-Vim is dry to the touch and is put up in 100-pound bags. No freight on barrels, no leakage, no loss from sticking.

At Last A Sure Cure For SCOURS

No more dead calves from scours! No more lost profits—or worry or disappointment! Here is a **positive, guaranteed cure**—it has saved and will save many calves, cows, horses, sheep and pigs. Simple to give, harmless and **sure to cure the disease.**

PAYNE'S SCOURS SPECIAL

You never know when a calf—or a whole herd of cattle—may be attacked with scours. Always keep a bottle of Payne's Scours Special on hand—and be ready to save your animals. Get a bottle today—at your dealer's or sent prepaid on receipt of $1.

"Last year we lost eight calves from White Scours. When we heard of Payne's Scours Special we bought a bottle to have on hand. Although every calf has since been affected by White Scours, they were all cured by Payne's Scours Special and are now thrifty young stock. Would never again raise calves without this remedy on hand."—F. E. Bogardus, Brasie Corners, N.Y.

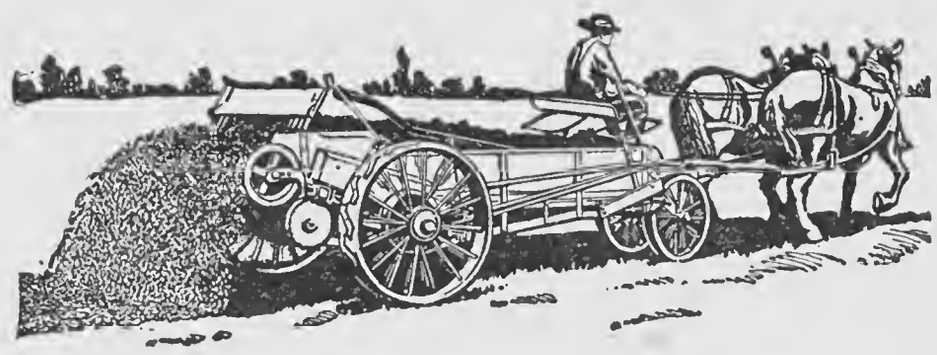
International Harvester Manure Spreaders



IF you want real, lasting spreader service you must have these things:

1. Correct, efficient, well-tested design.
2. Guarantee of first-class materials.
3. Reinforcing of parts where strains usually come.
4. Strength of parts where occasional strains come.
5. Wearing qualities and protection of driving parts.
6. Reputation of manufacturer, insuring efficient repair service.

International Harvester spreaders have every one of these. They have many other features that grew out of long field experience. Study the steel construction in frame, wheels, and driving mechanism; the easily-removable beater; the differentials in rear axles, insuring even spreading while turning corners; the reversible worm and gear; easily-loaded box; and many others.

International spreaders are of all styles and sizes, high and low, endless and reverse apron. Write for illustrated catalogues, and when we send them we will tell you where you may see the spreaders.

Certified Dairying in South Carolina.

"THE South Carolina dairyman has advantages in the economical production of milk, which are denied the northern farmer," declares George W. Irwin, of Orangeburg County. "We are now establishing a certified plant to supply our little city of 10,000 with pure milk. Regular milk is being sold in the city for 10 cents, and we intend meeting this price with a certified product. We have already been producing certified milk for two years. Since going into the certified production our city dairymen are doing better business, because they supply a better quality of milk. They have imitated our methods. The old fruit jar has had to go, and now bottles are used, and the farmer has cleaned up around his property. We graze our herd out much of the time, except on bad days. Conditions, however, are ideal with us. The stock can be out grazing as often as six days in a week. It is now October, and we are grazing on Bermuda grass. This pasture is about finished now. We started on it in April. The Bermuda grass will now be followed with Bur clover. We sow this about the first of October, to get the start, and we harvest a crop of hay about the last week in March. After the frosts have injured the Bermuda grass we turn on the young clover. We have a part of the field in rye, and the cows have access to this as well as the clover, and the cows go from one field to the other at their will. We broadcast rye and then plant Bur clover in drills about eight inches apart on the ground. We consider this a perpetual pasture of Bermuda grass, Bur clover and rye. The stock can pasture on the Bermuda grass from Spring until frost, and on the rye and clover the rest of the Winter season. When we use the Bur clover and rye for hay, we do not pasture it. The Bur clover will reseed, but under pasturage and cutting it is necessary to reseed annually. We have 15 acres of pasture for 30 cows, and these cows of course have other grazing, but this gives the cows about half their pasturage.

"We have a 70-ton silo on the farm, and feed silage supplementing the pastures in the Winter. This year we got 10 tons to the acre. We raise most of our feeds. We feed cottonseed, which we raise, we raise our corn for our corn chop, but we buy wheat bran. We raise our oats. We find corn and oats give milk a good flavor. We do not feed them at the same time, but we do feed them in about the same proportions. We feed corn mainly in Winter and oat chops in Summer."

LIVE STOCK AND DAIRY PRICES.

Nov. 2. Working oxen $250; cows $50; butter, per pound 30; milk, per quart five cents; apples, per barrel $1.50; potatoes, per bushel 65; turnips 40; cabbage, per dozen 35; eggs, 44; chickens (roasters) per pound 26; hay, Timothy, per ton $21. S. M. A.
Bolton, Conn.

Oct. 30. Dairy cows that are near to freshening and nearby springers are moderately changing owners at a price ranging from $80 to $95 per head. The price that is most commonly paid for milk during the six so-called Winter months here in Rochester by dealers is 4½ cents per quart f.o.b. Rochester. Hay is not in over abundance, medium grades selling on the city market loose, bulk loads, at $19 per ton. Corn fodder is a heavy growth, and nearly every dairyman who has a silo has it well filled. Owing to the above conditions I am inclined to believe that the number of desirable dairy cows that will be offered for sale this Fall and early Winter will be comparatively small. J. D. S.
Rochester, N. Y.

Oct. 29. Tomatoes, firsts ⅝ basket 75; peppers 35; cabbage 15 to 30, $3 per 100; carrots 30; cauliflower 90 to $1 per crate to $1.90 per bbl. Squash Golden Hubbard, 10 per basket, three for 25; green $1 per bbl. turnips, ruta bagas 30 to 35 per basket; purple top 20; white potatoes 35 to 45; sweets 50; sugar corn 50 to 75; beans, string, 60 per basket; Limas 90 to $1.15; egg plants 25, $2 per crate, fancy; parsnips 40; onions 75 to 90 per 100 pounds; beets $2 per 100 bunches; spinach 40 per basket; lettuce 85 to $1.25 per hamper; Kieffer pears 25 a basket; quinces $3 to $4 per barrel. Practically no apples are raised here. Western fruit brings from $1 to $1.75 per box. York State apples are from $1.75 to $4 per barrel as to kind and quality. Milk retails here at eight cents per quart.
Barrington, N. J. H. L. B.

Cattaraugus County, N. Y.

WILL you tell us what farmers are receiving for milk and its products in Cattaraugus Co., N. Y., at this time? Is that county reasonably level, or is it rough and stony?

Milk brings $1.60 at the door and $1.65 delivered to the Merrill Soule Co., while cheese sells at 14 cents. In regard to the land, it is stony and of considerable variety in quality. The hill farms are less stony but also less fertile, but strong grass land. The valleys have some fine level land, good for corn, wheat and potatoes. Clover abounds and Alfalfa is being introduced in our section of Cattaraugus Co. All of the hill land is tillable hereabout. People are coming in from nearby States, attracted by the cheaper prices of these farms. K. S. J.
Delevan, N. Y.

I send contract for a period of one year, beginning April 1, 1914. Our contracts are drawn for six months. In regard to the lay of the land, would say that Cattaraugus County is considered hilly although it is nearly all tillable and generally not very stony, yet there are some small stones on all of the upland. My farm lies in a valley that is level, free from stone, and nearly four miles wide.

Oct. 1914	$1.65	per 100 lbs.
Nov. 1914	1.80	per 100 lbs.
Dec. 1914	1.85	per 100 lbs.
Jan. 1915	1.80	per 100 lbs.
Feb. 1915	1.60	per 100 lbs.
Mar. 1915	1.50	per 100 lbs.

Conewango Valley, N. Y. C. E. D.

Natural Atmospheric Milking Soothes the Cows

The two side drawings show why the Empire is the gentlest, safest, simplest mechanical milker—why its action is soothing to even nervous cows—why it doesn't cause sore, inflamed teats and udders.

Figure at left shows action of teat cup when gently massaging teat. This is done by *natural* air pressure—*not* compressed air. Figure at right shows teat cup in vacuum period that succeeds massaging. Note the *natural* milk flow.

EMPIRE Mechanical Milker

Increases Milk Yield—Decreases Work

The capacity of the double or two cow unit is 20 to 30 cows per hour. One man can operate 1 or 2 double units. Its air tight construction prevents milk contamination by either stable odors or impurities. Write for full description and pictures of Empire Milkers in use in modern dairies everywhere. Also ask us for our offers on our famous Empire Cream Separators, Empire Sta-Rite Engines and Empire Star Feed Mills.

Black Wall Map of the World

The World and the United States At A Glance

A Great Education

At Your Fingers' Tips

This beautiful Wall Map, size 25x39 inches. On one side we have a complete, up-to-the-minute map of the United States in bright colors, showing the Capitols, Railroads, Rivers, large cities, etc. It also shows portraits of our 27 Presidents, and gives their biographies.

On the reverse side we have a map of the world, printed in a deep, ebony black. White and colored lines differentiate countries, rivers, lakes, cities and mountains. You never saw a map as black, as beautiful, as wonderfully enlightening as this map of the world. From this you may in a single day learn more than you could in a year's study of books.

Contrasting with the ebony black of the map are the flags and the coat-of-arms of all nations, in their flashy, exquisite colors. Our own seventeen flags are here in beautiful, bright colors—did you know that the United States had seventeen different flags?

And then, there's that wonderful Bible information. How many books, chapters, verses, words, letters does the Bible contain? How many books are classified as History, Poetry, Law, Prophecy, Epistles? Which books are exactly alike? How many times is the name of our Saviour mentioned? In how many languages is our Bible published?

Wouldn't you want to know these things? And wouldn't you want to know the many, many other things this marvelous Map of Knowledge possesses?

The Map will be sent, postpaid, for One New Yearly Subscription, or Twenty 10-Week Trial Subscriptions, or Two Yearly Renewal Subscriptions.

The Rural New-Yorker, 333 West 30th St., N. Y.

THE NATIONAL DAIRY SHOW.

THE National Dairy Show is one of the great exhibitions that has lived up to its name and has become truly national in character. The recent exhibition at Chicago was an immense affair, bewildering in its variety and complete display. This show has become as characteristic as the great English shows which have done so much to improve the live stock industry of Great Britain.

The showing of over 1,500 of America's choicest cattle, and high quality importations numbering now in American herds, were only incidental features of the show compared with the grand showing of men. Keen rivalry in show ring, possibly occasioned jealousies, but men took their medicine. "Some day we may have a typical American breed, it may not be Holstein, Jersey, Guernsey, Ayrshire or Swiss, but when our stock goes to Japan, to South America and Africa, it will not be recognized by inherited names from breed homes in Europe, but will carry honor to American dairy activity," was the forecast of one speaker.

"What is new in breeding." This was the question put to members, officials and judges of breeds at the show. Professor Van Pelt of Iowa answered this question: "The Holstein men have gone to breeding monstrous massive cows. This has been their tendency for several years, and can be overdone. There is a similar tendency among Jersey men and among the other breeds. The small delicate refined type of Jersey is a beautiful creature under blanket in the stall and in the show ring, but more vigorous animals are needed for the farm. Jerseys have reached this extreme and we must be careful not to swing to monstrosities in the next few years. It seems the Guernsey men are right in aiming toward a medium type of animal efficient under farm conditions."

Secretary William H. Caldwell of the Guernsey Association stated: "The dairy cow has to stand as a producer. We consider the Guernsey holds the world's record in economy as well as the championship. The efficient producer is the type of cattle Guernsey men advise in herds."

Secretary Winslow of the Ayrshire Association declared that it was the tendency to have larger and more rugged Ayrshire cows. The Ayrshire does well on limited pastures of mountain districts, or responds to liberal growth of the valley meadow lands." The tendency is for animals that will stand liberal feeding and will reimburse the owner."

"The large rugged cow is the ideal of the Holstein breeder. Men want cows with capacity to produce dairy products. They want cows with vigorous constitutions to enable them to endure the strain of production and reproduction," was the sentiment of speakers at the Holstein banquet at the dairy show.
